During the time of the flux, if it be moderate, there is no occasion for any assistance from medicines, but a proper diet is to be observed; all windy foods are to be avoided, as also all astringent ones; the use of spirituous liquors is to be restrained, and the mind kept quiet and free from the commotions of any of the passions. When the discharge is too small, it is to be promoted; and when it is really too great, and the strength of the patient cannot bear it, then the nitrous, cinnabarin, and absorbent medicines are to be given, as powders prepared of sal prunella, cinnabar either native or antimonial; if there be urgent necessity some gentle opiate may be added to these, as the pill de lyase, or de cynoglossa. After this, gentle clysters are to be injected, and then the use of specifics is to be entered on; among these, a decoction of the common yarrow is of singular virtue in decoctions of maidenhair alo, and other like herbs, are of great use. After the fit is over, bleeding must be repeated at the equinoxes, and gentle purges given at times, especially small doses of rhubarb, which has an abstergent virtue that renders it peculiarly proper; and this may be given even in the time of the fit, in small doses. Old confere of red roses has been recommended as a very good medicine in this case; it may be mixed with new milk, and an ounce of it taken three or four times a day; a tea-cup full of the tincture of roses may be taken about an hour after every dose of the confere. Half a dram of the Peruvian bark taken in a glass of red wine, sharpened with a few drops of the elixir of vitriol, three or four times a day, will be useful as a strengthener and astringent.

HEMORRHOIDS, blind, hemorrhoidal cancer, or external, are inflammations of the external hemorrhoidal vessels about the orifice of the intestine rectum, which sometimes form simply turgent, sometimes inflammatory tumors, and are meant by nature for the discharge of blood from this part to relieve hemorrhages.

The blind piles are of two kinds, either simply turgent, or tumid, the latter kind are painful, the former wholly indolent. The turgent blind piles resemble a soft transparent vesicle filled with a blackish blood, and are attended with no sensible uneasiness, except at the time of going to stool, when they occasion a sensation resembling that of a bean or plum stone, or like lying, stopping in the passage; and at times there is an uncommon heat in the parts.

The tumid blind piles are situated a little deeper within the verge of the extremity of the intestine, and resemble a hard and inflammatory tumor; these are properly indeed no other than *funguli* of this part, and occasion very violent and exquisite pains from the sensibility of the nervous and muscular coat which lines the intestines. Many authors reckon beside these under the name of blind piles all the tumid excrescences, and fungous and ulcerated protuberances, that happen about the anus; these are distinguished indeed by the appellation of *spurious hemorrhoids*; they usually owe their origin to venereal taints, but sometimes arise from the *carcinoma* of the piles, which in bad habit, and bodies subject to ulcerose scirrhus, sometimes degenerate into these dry and verrucose swellings, and are called *thyri*, *masijci*, and *fungi ani*. Junker's Conf. Med. p. 233.

The external or blind piles differ from the internal in regard to the vessels to which they owe their origin, the internal arising from the vena porta, the external from the vena cava; they differ also in their size, and in the quantity of blood they discharge; the internal ones usually discharge a moderate quantity, and if they are any way disturbed they will throw off a great deal, whereas the external rarely bleed at all, but only show themselves in these blind tumors. The internal also have their regular periods, and very frequently observe the monthly discharges of menstrua in women, returning as regularly in men as these in that sex: the others have no regular periods, but principally appear about spring and autumn; and they appear the larger, and have the more blood derived to them, the oftener they have already risen in a person. Their magnitude is very different in different persons: in some they are of the size of a hazel-nut; in others of a walnut, and in some they often grow to the size of a pigeon's or even a hen's egg.

The turgent piles either break naturally, or are to be opened by a surgeon; and when this is done, they not only discharge the blood they contained, but also supply a farther quantity afterwards. The tumid ones have all the signs of inflammatory tumors, attended with the most exquisite pain.

HEMORRHOIDS, blind, persons subject to them. The turgent external piles are principally incident to those of a phlegmatic and pituitous habit; they often indeed appear in women during their going with child, without their being of this temperament, especially toward the latter part of their time, if they fit much; and sometimes they happen even during the labour-pains, when the fetus presses heavily upon the pelvis.

HEMORRHOIDS, blind, causes of them. The general cause of them is a plethora attended with a thickness of blood; whence nature, attempting to relieve herself by a hemorrhage of those vessels, derives a larger quantity of blood than ordinary to them, where it remains, and according to its different state, forms either simple vesicles or inflammatory tumors. The accidental causes which bring them on, are immoderate attritions in these parts, from riding long journeys by persons unused to that exercise, from an itching or sharp humour about the part, from the painful voiding of the excrements in persons very colicive, and from labour-pains in women. Junker says, that they are sometimes got by sitting down in the seat in which a person has been just sitting, who has the ulcerated piles, while it is yet warm from him. To these it is to be added, that they frequently come on from an emission of accreted bloodings, from an improper use of aloe, hellebore, and other hot medicines, and from too high-seasoned foods, and the immoderate use of spirituous liquors.

HEMORRHOIDS, blind, prognostics from them. The blind piles are always in a state of tendency to a salutary end, that is the evacuation of part of the abundant blood in plethoric habits; but from the smallness of the vessels where they are formed, they very often miss of their proper end. When they either burst naturally, or are opened by art, they then afford for some time a discharge that may supply the place of that by the internal hemorrhoids. When they burst of themselves, they easily become ulcerated afterwards, but this is not attended with any violent pain. As soon as opened, the vessel which formed the tumor becomes flaccid and rugose in that part, and forms a sort of papule or little tubercles, which, if not taken care of in the proper way, often continue to discharge a small quantity of blood at every time the person has a hard

hard stool; and even in some cases these papule have continued without intermission discharging a small quantity of blood for many years; sometimes also they degenerate into ferruginous and pruriginous little ulcers, which are called *ferpigi ani*, or *pruritus ani*. This is a troublesome complaint, and it is not unfrequent in people subject to the external *hemorrhoids*, though not much regarded by authors; it never spreads far, but often continues many months in the same spot; and if by unskillful treatment it be repelled from thence, it sometimes returns again more violently in the neighbouring parts, and some times occasions disorders of a worse nature in the more distant ones.

The tumid and *turficent piles* are both without danger to the life of the patient, unless in such cases where they are violently suppressed, on persons who have been long subject to them. The tumid are however attended with one danger, which the *turficent* are free from; this is, that if unskillfully managed, they will sometimes come to a suppuration, which terminates often in a fistulous ulceration. This too often happens when they are cut too deeply into, during the time of their ripening, and are kept open too long afterwards without being well cleaned. When *hemorrhoidal* affections become ulcerous, they are more contagious than almost any other disease; and as this is not commonly known, many suffer by it.

HÆMORRHOIDS, blind, method of cure. The *turficent piles*, if treated in the common way of tumors and little ulcers by a skillful surgeon, are very rarely attended with any bad consequences. The tumid, give much more trouble. The first attempt must be to discontinue them; and to this end bleeding in the foot is one of the first things to be done, in cases where there is a plethoric habit; and very strong decoctions of yarrow are to be given, several doses in a day, and external remedies, such as the unguentum linariae, and the root of the scrophularia are to be applied; these are by some esteemed specifics, and botanical authors boast wonders of their effects. The patient may sit over the steams of warm water; or apply a linen-cloth dipped in warm spirit of wine to the part, or poultices made of bread and milk, or of leeks fried with butter. The body may be kept gently open by small doses of equal quantities of the flowers of brimstone and cream of tartar; a tea-spoon full of which may be taken two or three times a day: or an ounce of the flowers of brimstone and half an ounce of purified nitre may be mixed with three or four ounces of the lenitive electary, and a tea-spoonful of it taken three or four times a day: or, an electary may be prepared of one ounce of flowers of sulphur, half an ounce of cream of tartar, a sufficient quantity of treacle, and taken as the other: emollient clysters are also beneficial, or if the stricture of the anus prevents the injection of these, a visit will have good effect. *Buchan's Dom. Med. p. 366.* If by these means, after three or four days trial, there appears no hope of their being disaffected, then they are to be saturated by all means and with all speed that may be. To this purpose a cataplasm of a roasted onion with linseed-oil and veal-fat, is by many greatly recommended, and when the pains are violent, internal medicines are to be given, such as nitre with the cooling emollients, and, when necessary, a gentle opiate. Oil of eggs is greatly recommended also for external use, to allay the pain, or, for this purpose, a liniment made of two ounces of emollient ointment and half an ounce of liquid laudanum, beat up with the yolk of an egg, may be applied. When they are brought to maturation, they are to be discharged by fixing leeches on or near them; or, if these will not fix, by carefully opening them with a lancet; and the cleansing and healing them up are then to be forwarded by all possible means. Internally, gentle laxative medicines are to be given, such as the lenitive electary, and the like, with manna, fenna, and other gentle purges; then medicines which purify the blood, and such as quiet its too violent emotions. After the cure is completed, the best method to prevent a return is bleeding in spring and autumn, and applying leeches to the *hemorrhoidal* veins at any time when threatened with a relapse. *Junker's Consp. Med. p. 240.*

HÆMORRHOIDS, suppression of them. Physicians consider the suppression of the *hemorrhoids* in three respects: 1. When they have never yet flowed at all, but all the attempts of nature are observed toward their appearance, and all the preceding symptoms of them form. 2. When they have been used to flow habitually, but their course has usually been impeded by accidents; this is often the case in what are called the *blind piles*. And, 3. When they have been used to flow regularly and well, and at fixed times, for a long course of time; the suppressions in these different states are attended with different symptoms and different disorders.

HÆMORRHOIDS, signs of suppression of them. There are

frequently the common hypochondriacal affections, first appearing in pains and tension of the left hypochondrium, extending to the region of the loins. These are succeeded by spasmodic pains, violent colics, inflations of the spleen, reachings to vomit, obstinate coliciveness, a hardness of the abdomen, and finally, infirmities and febrilities of the viscera, melancholy, madness, and a vomiting of blood; these are the succession of symptoms, which naturally attend suppressions of the internal *hemorrhoids*. The suppressions of the external are often violent fits of the gout, nephritic complaints, and the voiding of blood by urine; add to these, that the most frequent symptom attending the suppression, either of the external or internal, is an asthmatic difficulty of breathing, often attended with a cough. The persons most subject to these suppressions from natural causes, are those of a melancholic disposition, such as are easily terrified, or grieved at trifles and such as have suddenly changed a life of labour into a sedentary one.

The internal and natural causes of their suppressions are principally a thickness of the blood, or a violent organic commotion of it; the external and accidental causes of it are the improper use of astringent medicines, the drinking of large draughts of cold liquors when very hot, a thick and heavy diet, and a too great coldness of the abdomen. The suppression is usually very difficult to be removed, but in general is found much more easily to give way to medicines when owing to natural causes than to accidental; and it is to be observed, that a suppression of them in the first attack is less dangerous than when they have appeared.

HÆMORRHOIDS, method of cure. In cases where *hemorrhoids* have never yet appeared, but only the antecedent symptoms are perceived, great caution is necessary to determine, from the habit and constitution of the patient, whether it be proper to encourage and promote their appearance, and assist nature in the way she is endeavouring to ease herself; or whether it may not be better to carry off the redundant blood some other way. If the body be in such a state as to promise a successful flux from them, it is to be promoted by gentle aperients; but if otherwise, the blood is to be derived another way by bleeding in the arm, and the patient is to be ordered to use frequent exercise. In cases of suppressions of usual and habitual fluxes of the *hemorrhoids*, the symptoms are to be first alleviated by bleeding in the arm, then emollient clysters are to be administered, such as chamomile-flowers boiled in milk, and after these the quality of the blood is to be amended by proper internal medicines, its violent emotions to be taken off by nitre, absorbents, and the like, and its spissitude removed by attenuants. After this, its derivation to the proper parts is to be promoted by gently stimulating medicines; such as aloes and all its preparations, particularly elixir proprietatis; and sassafras and borax may also be given in small doses; to this may be added the use of stimulating clysters and rectified spirituous; and the application of leeches to the parts. *Junker's Consp. Med. p. 37.*

HÆMORRHOSCOPIA, formed of *hæm* and *scopia*, *visu*, I *scopis*, *examini* I *offerre*, an old term used by the writers in *Medicine* to express an examination of the blood drawn from a patient by phlebotomy, in order to judge of the nature of a disease by it.

HÆMORRHUS, in *Zoology*. See *BIRD SNAKE*.

HÆMOSTASIA, formed of *hæm* and *stasis*, *stasis*, or *stasis*, occurs in some writers as the name of a disease occasioning sudden death; and it is said to be a total stagnation of the whole mass of blood from a pletoria.

HÆMOSTATICA, formed of *hæm* and *stasis*, I *stas*, a name given by some authors, to medicines used to stop hemorrhages, whether internally taken, or externally applied.

HÆPHESTITES lapis, in *Natural History*, a name given by authors, to a stone of a reddish colour, and capable of a high polish. The ancients gave it this name, from its property of setting fire to dry substances by reflection when formed into a concave speculum. They hence called it the *Vulcanian stone*, or *hæphestites*, not considering that the shape into which they formed it, and not the nature of the stone, was the cause of the effect; any stone being capable of the same. If hard enough to bear a proper polish. About Hildesheim they have, at this time, a sort of blackish-red coarse Jasper, which they take to be the *hæphestites* of the ancients, and use it, at this day, for the same purposes, hollowing large pieces of it into speculums, and setting them, when well polished, in proper frames, and using them as burning-glasses.

HÆREDE abductus, is a writ which anciently lay for the lord, who, having by right the wardship of his tenant under age, could not obtain his body, as being conveyed away by another.

HÆREDE *deliberanda alii qui habet custodiam terre, a writ directed to the sheriff, willing him to command one that had the body of him who was ward to another, to deliver him to the person whose ward he was on account of his land.*

HÆREDI *rights.* See **RAVISHMENT** *de gerd.*

HÆREDIPETA, in *our Ancient Latin Books*, the next heir.

Et melius hæredipeta seu præcipuus vel extraneus periculosa sua custodia committitur. Leg. Hen. I. cap. 70.

HÆREDITAS See **ABEYANCE**.

HÆRESIARCH, **HÆRESIARCHA**, of the Greek *αἱρεσιάρχης*, an arch-heretic. See **HERETIC**.

HÆRESIS, *heresy.* See **HERESY**.

HÆRETICO *curator*, a writ which anciently lay against a heretic, who, having once been convicted of heresy by his bishop, and having abjured it, afterwards falling into it again, or into some other, is thereupon committed to the secular power. This writ is thought by some to be as ancient as the common law itself, however the conviction of heresy by the common law was not in any petty ecclesiastical court, but before the archbishop himself in a provincial synod, and the delinquent was delivered over to the king to do with him as he pleased: so that the crown had a control over the spiritual power. But by 2 Hen. IV. cap. 15. the diocesan alone, without the intervention of a synod, might convict of heretical tenets; and unless the convict abjured his opinions, or after abjuration he relapsed, the sheriff was bound *in officio*, if required by the bishop, to commit the unhappy victim to the flames, without waiting for the consent of the crown. This writ remained in force, and was actually executed on two Anabaptists in the seventh of Elizabeth, and on two Arians, in the ninth of James I.

Sir Edward Coke was of opinion, that this writ did not lie in his time; but it is now formally taken away by statute 29 Car. II. cap. 9. But this statute does not extend to take away or abridge the jurisdiction of Protestant archbishops or bishops, or any other judges of any ecclesiastical courts, in cases of atheism, blasphemy, heresy, or schism, and other damnable doctrines and opinions; but they may prove and punish the same according to his majesty's ecclesiastical laws, by excommunication, deprivation, degradation, and other ecclesiastical censures, not extending to death, in such fact and no other, as they might have done before the making of this act. See **HERESY**.

HÆRETICUS, *heretic.* See **HERETIC**.

HÆRETULA, in *Natural History*, a name given by Mr. Lhuys, to a species of *POSSIDA* *ovifer-bell.*

HÆRMIA, an Indian fruit, resembling pepper, esteemed good to strengthen the stomach, disperse flatulencies, and restore the *acids* when relaxed.

HAFHERT, in *Ornithology*, the name of a bird described by Høier, which is seen usually at sea, and is supposed to be a foreteller of storms. It is of the size of a common hen, and resembles the falcon in shape. It is all over of a greyish colour, variegated with spots of white. Its beak is strong and hooked like the falcon's, but it is shorter. The fishermen dread the appearance of this bird, and at sight of it always make to shore as fast as possible, expecting tempests and bad weather.

HAFIZ, or **HAFIZI**, is a name given in Turkey to those who learn the whole Alcoran by heart; and who, on this account are held in great veneration by the people.

HAGA, in *our Old Writers*, has different significations. In Doomsday it is taken for a house in a city or borough. An ancient anonymous author says it is a house with a shop, *Damus cum faga.*

HAGABLUM, in *our Old Writers*, the same with *gallum* or *gall.*

HAGGAL, a canonical book of the Old Testament, so called from the prophet of that name, who in all probability was born at Babylon, from whence he returned with Zerubbabel.

This prophet, in the second year of Darius, or the five hundred and twentieth before Christ, exhorted the Jews, after their return from their captivity to finish rebuilding the temple which they had interrupted for fourteen years. His remonstrances had the desired effect; and to encourage them to proceed in the work, he assured them from God that the glory of this latter house should exceed the glory of the former; which was accordingly fulfilled when Christ honoured it with his presence: for with respect to the building, this latter temple was not to be compared with the former.

HAGGARD, in *Falconry*, a **HAWK**, or **FALCON**, not taken in the nest; but after the hawk had been caged to liberty, and preying for herself. The word is French, and signifies *force*; some derive it from the Latin *agere*, *agere*, *agere*, others from the German *hag*, inclosure, fortified place. Whence

Vol. II. N° 163.

Mr. Huet observes, the word *haggard* is sometimes applied to a man who becomes hardy and proud, in confidence of the strength of the place he is in.

Haggard hawks are hard to tame, and bring under discipline.

HAGGS, a kind of berry met with on men's hair, or horses' manes, now known to be electrical phenomena.

HAGIAM, in the *Matæia Medica*, a name given by some of the Arabian Physicians, to a kind of *sebum*, or camel's hay. The Greeks made several kinds of this, according to the places from whence they received it; the *sebum* of different countries differing in virtue; but the Persian was, in many ages, esteemed the best kind; and this is probably what the Arabs called *bagiam*. The interpreters of Avicenna leave this word wholly unexplained. Garcias, according to what shall be had in the Arabic, supposes it the name of the city Damascus, and given to such *sebum* as came from that part of the world: but this seems erroneous. The Arabs called all other nations barbarians; and this term gentility or barbarism, was, in their language, expressed by the word *bagiam*; they hated the Persians beyond all other nations in the world, and called them *bagiam* by way of eminence, and therefore *bagiam* and Persian were a sort of synonymous words. It is probable they had their *sebum* principally from Persia; and that this, whether better or worse than the Nabatean *sebum* of their own country, was distinguished by the epithet of *sebum*, and that with the word by which they expressed Persian.

HAGIOGRAPHY, a name given to part of the books of Scripture, called by the Jews *Cawim*. See **CARON**.

The word is compounded of *hagios*, *holy*, and *grapho*, *I write*. The name is very ancient: St. Jerome makes frequent mention of it, before him, St. Epiphanius called these books simply *Tanach*.

The Jews divide the sacred writings into three classes: the Law which comprehends the five books of Moses; the Prophets, which they call *Neviim*, and the *Cawim*, *כְּתוּבִים*, called by the Greeks, *Sec. Hagio-grapho*; comprehending the book of Psalms, Proverbs, Job, Daniel, Ezra, including also the book of Nehemiah, Chronicles, Canticles, Ruth, the Lamentations, Ecclesiastes, and Esther.

The Jews sometimes call these books the Writings, by way of eminence, as being written by immediate inspiration of the Holy Spirit. Thus says Kimchi, in his preface to the Psalms, Maimonides in *Moré Nevuch*, and Elias Levita in his *Thibb*, under the word *כְּתוּבִים*.

They distinguish the *hagio-grapho*, however, from the prophets; in that the authors of the former did not receive the matters contained in them by the way called Prophecy, which consists in dreams, visions, whispers, ecstasies, &c. but by mere inspiration, and direction of the Spirit.

HAGIOSIDERON, or **HAGIOSIDIRON**, compounded of *hagios*, *holy*, and *sideros*, *iron*. The Greeks who are under the dominion of the Turks, being prohibited the use of bells, made use of an iron wherewith to call people to church, called *hagiosideron*.

Magnus gives us the description of a *hagiosideron* he had seen. It is a plate of iron, about three inches broad, and sixteen long, fastened by the middle to a chain or cord, whereby it is suspended at the church-door. On this they strike with an iron hammer, with some measure and cadence, so as to make no disagreeable noise.

They also carry a *hagiosideron* before the priest, in procession of the sacrament to any sick person, bestowing on it from time to time, to advertise the people to adore it; much as in the Romish church they do with a bell.

HAIHALEM *minci*, in *Botany*, a name by which the modern Egyptians call the plant we name *Artichoke*, and *scapularium aquaticum*, the water-follier, and water-bonick. The hall of these names is a verbal translation of the Egyptian one. Some have supposed that the *nilifer* was called by this name by the ancient Egyptians; but this is an error; the plants are so perfectly different from one another, that they have nothing but the growing in water in common between them.

HAIL, a name used by the Brazilians, for an animal we call the sloth, or *ignavia*. The word seems pronounced by the creature itself, as its common note, and thence became used as its name.

HAIL, *grands*, in *Physiology*, an aqueous concretion, in form of white or pellucid spherules, descending out of the atmosphere.

Hail is conceived to be formed of drops of rain, frozen in their passage through the middle region. Others take it for the fragments of a frozen cloud, half-melted, and thus precipitated, and congealed again. Accordingly the Cartesians define *hail* to be a cloud, either wholly, or in part, liquefied; which tending downwards by its own gravity, is, in its passage, frozen again

by the action of some very cold wind; and thus precipitated, for the most part, in round transparent globes. They add, that if the cloud hath been totally liquefied, the *hailstones* are pellicled; otherwise they are only partly so. *Hail* assumes various figures, according to the degrees of heat or cold of the air which it passes through in its descent; sometimes it is round, sometimes angular, triangular, pyramidal, &c. sometimes thin and flat, star-like, with its equal points, &c.

Signior Beccaria supposes, that it is formed in the higher regions of the air where the cold is intense, and where the electric matter is very copious. In these circumstances, a great number of particles of water are brought near together, where they are frozen, and in their descent collect other particles; so that the density of the substance of the *hailstone* grows less and less from the centre; this being formed first in the higher regions, and the surface being collected in the lower. Accordingly, in mountains, *hailstones* as well as drops of rain, are very small; and both agree in this circumstance, that the more intense is the electricity that forms them, the larger they are.

Hail is observed frequently to attend thunder and lightning with regard to which, Beccaria observes, that as motion is known to promote freezing, so the rapid motion of the electrified clouds may promote that effect in the air.

Natural histories furnish us with a great variety of instances of extraordinary showers of *hail*. See Phil. Trans. N° 203, and Hist. de France, tom. ii. p. 339.

HAILL, a sea-term, signifying either to call to a ship, to know from whence she comes, and whither she is bound, or else to salute her, and with her well.

HAILL, small filaments, issuing out of the pores of the skins of animals; and serving most of them as a tegument, or covering.

In lieu of *hair*, the nakedness of some animals is covered with feathers or wool.

Hair is found on all parts of the human body, except the soles of the feet, and the palms of the hands. But it grows longest on the head, chin, breast, and arm-pits, and about the privities.

Dr. Tyson observes, that though the outward surface of the body be the usual place where the *hair* grows; yet it has been sometimes found on the tongue, in the heart, the breasts, kidneys, &c. but that there is scarce any inward part more subject to it than the ovary, or testicles, of females. Hooke, Philosoph. Collect. N° 2.

Physicians distinguish the *hair* into several kinds, and give it divers denominations; but this only in Greek and Latin. The *hair* of the head they call *capillus*; that of women particularly, *tons*, from *tonso*, to dress and adjust; and that of men *calvaria*, from *calcare*, because often cut; that of the back of the head, *juba* and *crinis*; that hanging behind the ears, *vincini*; &c. &c. curled and buckled.

The ancients held the *hair* to be a sort of excrement, fed only with excrementitious matters, and no proper part of a living body. They supposed it generated of the floginous parts of the blood, exhaled by the heat of the body to the surface, and there condensed in passing through the pores. Their chief reasons were, that the *hair*, being cut, will grow again apace, even in extreme old age, and when life is very low; that in hectic and consumptive people, where the rest of the body is continually emaciating and attenuating, the *hair* shall thrive very well; nay, and that it will grow even on dead carcasses. They add, that *hair* does not feed and grow like the other parts, by introduction, i. e. by a juice circulating with it; but like the nails, by juxtaposition, each part next the root thriving forward that immediately before it.

But the moderns are agreed, that every *hair* does properly and truly live, and receive nutriment to fill and dilend it like the other parts; this they argue hence, that the roots do not turn grey in aged persons sooner than the extremities, but the whole changes colour at once. And the like is observed in boys, &c. which shews, that there is a direct communication, and that all the parts are affected alike. We are told of instances of persons, who by intense grief, fear, or study, have grown grey in a night's time.

It may be observed, however, that in propriety, the life or growth of *hair* is of a different kind from that of the rest of the body, and is not immediately derived therefrom, or reciprocated therewith; it is rather of the nature of vegetation. They grow as plants do out of the earth, or as some plants shoot from the parts of others; from which though they draw their nourishment, yet each has, as it were, its several life, and a distinct economy. They derive their food from some juices of the body, but not from the nutritious juices of it; whence they may live, though the body be starved.

The *hairs* examined by the microscope, appear to be filitulous bodies like horns. Their tubulous structure is also confirmed from the delicate called *plica palmia*, wherein the blood enters out at their extremities.

Each *hair* is found to consist of five or six other lesser ones, all wrapped up in one common tegument: they are knotted like some sorts of grass, and sent out branches at the joints. They have each an oval bulbous root, which lies pretty deep in the skin, being implanted in the pyramidal papilla; and by this they imbibe, or secrete, their proper food from the adjacent humours. This oval root is covered by a whitish strong membrane, in some measure elastic, and is connected either to the skin, to the *carpal adiposum*, or to both, by a great number of very fine vessels and nervous filaments. The stem having reached the surface of the skin, pierces the bottom of a small fossa between the papillae, or sometimes a particular papilla, and there it meets the epidermis, which seems to be turned round it and united with it. A sort of unctuous matter transudes through the sides of the follicle, which is believed on the stem, and accompanies it more or less, as it runs out from the skin, in form of a *hair*. Their extremities split or divide, into two or three branches, especially when kept dry, and left to grow too long; so that what to the naked eye appears only a single *hair*, to the microscope seems a braid.

They turn grey on the fore part of the head, and particularly about the temples, sooner than behind; the back part affording them the proper juice longer than the rest. For the like reason they also fall soonest from the crown of the head.

Their size, or thickness, depends on the magnitude of the pores they issue from: if those be small, those are fine; if the pores be strait, the *hairs* are strait; if those be oblique or sinuous, the *hair* is curled.

Those who have by nature, soft, thin, and short *hair*, which with great difficulty receives and retains a buckle, and those who readily become bald, or shed their *hair* toward the spring, are certainly of a loose, flabby, and relaxed state of nerves. For the *hair* seems to be only some of the fleshy fibres lengthened outward, and hardened; at least they seem to be of the same kind and nature with the other fibres, consisting of many lesser filaments, contained in a common membrane, and are solid, transparent, and elastic. And as the *hairs* are in strength, bulk, and elasticity, so generally are the fibres of the body. Therefore those whose *hair* sheds, turns thin, lank, or refuses buckle, if it does not happen to them after recovering from an acute distemper, ought to be careful of falling into nervous disorders.

Other things being equal, those of the fairest, clearest, and highest coloured *hair*, are of the loosest and weakest state of fibres and nerves; not only because the fairest and lightest is the most rare, transparent, and fungous; but because bodies of the lightest parts consist of parts of a weaker union, which adhere with less force, and consequently are less elastic, firm, and springy, than those of darker and more opaque colours. It is generally observed that persons of very fine and white *hair*, especially if so after they are come to maturity, are of tender and delicate constitutions; and those who deal in making artificial coverings for men and women, find that such *hair* will never serve those purposes with any credit to them, and seldom honestly employ it to that end.

Hairs ordinarily appear in general round, or cylindrical; but the microscope also discovers triangular, and square ones; which diversity of figures arises from that of the pores; to which the *hairs* always accommodate themselves. Their length depends upon the quantity of the proper humour to feed them; and their colour on the quality of that humour: whence at different stages of life the colour usually differs.

The *hairs* of different animals are very different in their appearance before the microscope. Malpighi discovered *hairs* to be tubular, or composed of a number of extremely minute tubes or pipes; this he discovered in examining the *hair* of the mane and tail of a horse, and the bristles of a bear; and these tubes were much more dilated in the ends of the tubes than elsewhere, as they there appeared more open, and sometimes above twenty of them might be reckoned in one *hair*. In the hedgehog's prickles also, which are of the nature of *hairs*, these tubes are very elegantly discovered, and may seem to have a medullary part, and valves, and cells. There are also in the *hairs* of many animals, in some transverse, and in others spiral lines, somewhat of a darker colour, and running from top to bottom in a very elegant manner; a mouse's *hairs* are of this sort, and appear in joints, as it were, like the back-bone; they are not smooth, but jagged on the sides, and terminate in the sharpest point imaginable. The *hairs* taken from the mouse's belly are the least opaque, and finest for the microscope.

microscope. The darker medullary parts, or lines, Dr. Derham observes, are no other than fibres convoluted round, and lying closer together than in the other parts of the hair. They run from the bottom to the top of the hair; and, he imagines, may serve to make a gentle evacuation of some humour out of the body. Hence the hair of hairy animals, this author suggests, may not only serve as a fence against cold, &c. but as an organ of insensible perspiration.

The hairs of men, and of horses, sheep, &c. are composed of small, long, tubular fibres or smaller hairs, encompassed with a rind or bark; and from this structure a split hair appears like a stick shivered by beating. They have roots of different kinds in different animals, and are always thicker at the middle than at either end. Hairs of the Indian deer are perforated from side to side, and those of our English ones seem covered with a kind of scaly bark or rind. The whiskers of a cat, cut transversely, have in the middle something which resembles the pith of elder; and the quills of the hedge-hog and porcupine have somewhat of a pith in a star-like form. The hairs taken from the different parts of the human body, differ very much in their figures, appearing like different species of the same genus in plants. Hook's Micrograph. p. 157. Baker's Microsc. p. 246.

HAIR, diseases of. Among the many remedies for diseases of the hair, the following are recommended in the Philosophical Transactions. To make hair grow, take a quantity of the largest and finest roots of the common burdock that can be collected; let them be taken out of the ground in the month of December, bruise them in a marble mortar, and boil them in a quantity of white-wine till there only remains as much as will cover them; let this be carefully strained off, and every night, going to bed, let the head be washed with some of it warm. The other prescription is this: burn the slender twigs of vines to ashes, and boil these ashes in such a quantity of common water as will make a strong ley; let this be strained clear off, and the head washed every night with some of it warm. When the hair is good, but in danger of falling off by degrees, the ashes of the vine branches are to be boiled in red-wine instead of water, and this ley is to be used instead of the other. When the person wears powder, let some hermodactyls be reduced to fine flour and mixed with it; let this be the only powder used, and the liquor constantly employed in washing the head every night, and the falling of the hair will be wholly prevented. Philos. Trans. N° 288. p. 90.

Vulturnus, in Philosophical Collections, gives an account of a woman, buried at Norimberg, whose grave being opened forty-three years after her death, there was hair found issuing forth plentifully through the clefts of the coffin; inasmuch that there was reason to imagine, the coffin had some time been covered all over with hair. The cover being removed, the whole corpse appeared in its perfect shape; but from the crown of the head to the sole of the foot covered over with a thick-set hair, long and curled. The sexton going to handle the upper part of the head with his fingers, the whole structure fell at once, leaving nothing in his hand but a handful of hair: there was neither skull, nor any other bone left; yet the hair was solid, and strong enough.

Mr. Arnold, in the same collection, gives a relation of a man hanged for theft, who, in a little time, while he yet hung upon the gibbet, had his body strangely covered over with hair.

It was esteemed a peculiar honour among the ancient Gauls, to have long hair; and hence came the appellation *Galla cruenta*. For this reason Julius Cæsar, upon subduing the Gauls, made them cut off their hair, as a token of submission. It was with a view to this, that such as afterwards quitted the world, to go and live in cloisters, procured their hair to be shaven off; to shew that they had adieu to all earthly ornaments, and made a vow of perpetual subjection to their superiors.

Greg. de Tours assures us, that, in the royal family of France, it was a long time the peculiar mark and privilege of kings and princes of the blood, to wear long hair, artfully dressed and curled: every body else were obliged to be polled, or cut round, in sign of inferiority, and obedience. Some writers assure us, that there were once different cuts of the hair for all the different qualities and conditions; from the prince, who wore it at full length, to the slave or villain, who was quite cropped. Hrotsvan treats at large of this privilege of the kings of France, Franco Gallia, cap. 11.

To cut off the hair of a son of France, under the first race of kings, was to declare him excluded from the right of succeeding to the crown, and reduced to the condition of a subject.

In the eighth century it was the custom of people of quality, to have their children's hair cut the first time by persons they had a particular honour and esteem for;

who, in virtue of this ceremony, were reputed a sort of spiritual parents, or godfathers to them; though this practice appears to have been more ancient; inasmuch as we read that Constantine sent the pope the hair of his son Heraclius, as a token that he desired him to be his adoptive father.

The parade of long hair became still more and more obnoxious in the progress of Christianity; as something utterly inconsistent with the profession of persons who bore the cross. Hence numerous injunctions and canons to the contrary. Pope Anicetus is commonly supposed to have been the first who forbade the clergy to wear long hair; but the prohibition is of older standing in the churches of the East; and the letter wherein that decree is wrote, is of a much later date than that pope. The clerical tonsure is related, by Isidore Hispalensis, as of apostolical institution.

Long hair was anciently held so odious, that there is a canon still extant, of the year 1096, importing, that such as wore long hair should be excluded coming into church while living, and not be prayed for when dead. We have a furious declamation of Lothar against the emperor Phocas, for wearing long hair, after the manner of all the other emperors of the East, except Theophilus; who being bald, enjoined all his subjects to have their heads shaved.

The French historians and antiquaries have been very exact in recording the heads of hair of their several kings. Charlemagne wore it very short, his son shorter; Charles the Bald had none at all. Under Hugh Capet it began to appear again; this the ecclesiastics were displeased with, and excommunicated all who let their hair grow. Peter Lombard expostulated the matter so warmly with Charles the Young, that he cut off his own hair; and his successors, for some generations, wore it very short. A professor of Utrecht, in 1650, wrote expressly on the question, Whether it be lawful for men to wear long hair? And concluded for the negative. Another divine, named Reeves, who had wrote for the affirmative, replied to him.

The Greeks, and after their example the Romans, wore false hair.

Hair makes a very considerable article in commerce; especially since the mode of perukes has obtained.

The hair of the growth of the northern countries, as England, &c. is valued much beyond that of the more southern ones; as Italy, Spain, the south parts of France, &c.

The merit of good hair consists in its being well fed, and neither too coarse, nor too slender; the bigness rendering it less susceptible of the artificial curl, and disposing it rather to frizzle; and the smallness making its curl of too short duration. Its length should be about twenty-five inches; the more it falls short of this, the less value it bears.

There is no certain price for hair; but it is sold from five fillings to five pence an ounce, according to its quality.

The scarceness of grey and white hair has put the dealers in that commodity upon the methods of reducing other colours to this. This is done by spreading the hair to bleach on the grass like linen; after first washing it out in a luteous water.

This ley, with the force of the sun and air, brings the hair to perfect a whiteness; that the most experienced person may be deceived therein; there being scarce any way of detecting the artifice, but by boiling and drying it, which leaves the hair of the colour of a dead walnut-tree leaf.

There is also a method of dying hair with blismuth; which renders such white hair as bonkers too much upon the yellow, of a bright silver colour: boiling is the proof of this too, the blismuth not being able to stand it.

Hairs, made perfectly clean, and moistened with the solution of silver in aqua fortis, exposing it to the sun, in order to hasten the appearance and deepen the colour, will be changed from a red, grey, or other disagreeable colours, to a brown or deep black. The solution for this purpose should be fully saturated with the silver, diluted only with distilled water or pure rain water; and for the farther dulcification of the acid, it will be proper to add a little rectified spirit of wine. The liquids commonly sold under the name of hair-waters, are in reality no more than solutions of silver, much diluted with water.

Hair which does not curl or buckle naturally, is brought to it by art; by first boiling, and then baking it in the following manner: after having picked and forced the hair, and disposed it in parcels, according to lengths, they roll them up, and eye them tight down, upon little cylindrical instruments, either of wood or earthen ware, a quarter of an inch thick, and hollowed a little in the middle, called pipes; in which state they are put in a pot

not over the fire, there to boil for about two hours. When taken out, they let them dry; and when dried, they spread them on a sheet of brown paper, cover them with another, and thus send them to the pail-cook, who makes a crust, or coffin, round them of common paste, sets them in an oven, till the crust is about three-fourths baked.

The end by which a hair grew to the head, is called the *head of the hair*; and the other, with which they begin to give the buckle, the *point*. Formerly the peruke-makers made no difference between the ends, but curled and wore them by either indifferently; but this made them unable to give a fine buckle; hair woven by the point never taking a right curl. Foreigners own themselves obliged to the English for this discovery, which was first carried abroad by a peruke-maker of our country.

Hairs are also used in divers arts and manufactures.

The hair of beavers, hares, comies, &c. is the principal matter whereof hats are made.

Spread on the ground, and left to putrefy on corn lands, hair, as all other animal substances, viz. horns, hoofs, blood, garbage, &c. proves good manure.

Hair also makes an ingredient in the composition of plaster.

Hairs, in the *Mange*, and among *Furriers*, is popularly called the *eat*, and makes an object of principal consideration in respect of horses, &c.

If the ear of a horse, especially that about the neck, and parts uncovered, be sleek and smooth, and close, it is an indication of his being in health, and good case; if rough and flaking, or any way discoloured, it denotes a calicet, poverity, or some inward defect. To make the hair smooth, sleek, and soft, he must be kept warm, treated often, and when treated the coat must be well scraped, and rubbed down.

The hair growing on the fetlock serves as a defence to the prominent part thereof, in travelling on stony ways, or in frosty weather.

If a place be bare, or thin of hair, or the hair be too short, the ancient farriers used to wash it with the urine of a young boy; and after that with a ley of unslaked lime, ceruse, and lizarage. The moderns have various other ways: some wash the parts with the decoction of the roos althea; others, with goats milk, wherein agimony has been pounded; others rub the part with nettle-seed, bruised with honey-water and salt; others anoint it with the juice of an onion, or radish; others with a mixture of alum, honey, goats dung, and swines blood; others with the root of white lily, boiled in oil; others with tar, oil of olives, and honey; and others with green walnut-shells powdered, and mixed with honey, oil, and wine. To take off hair in any part, they apply a plaster made of unslaked lime, boiled in water, with ornament added.

HAIR-BALLS, masses of hair of different shapes and sizes found in the stomachs of cows, oxen, calves, deer, and other animals. Some of these are covered with a smooth, thin, hard, and shining coat or shell, and where have no covering at all, but show the naked hairs on their surfaces. Some are of a chestnut-brown, others of an ash-colour, and others of yet different colours. They are often found to ten or eleven inches in circumference, sometimes more, but very often much less; some of them are pretty exactly spherical, others of the figure of a prolate spheroid, others oblong and compressed, and others regularly oval.

These balls are found in one or other of the four ventricles of the animal, and are sometimes voided by stool. It is very evident they are formed of the hair of the animal, which it has licked off and swallowed, and which, by the motion of the stomach, which in these creatures is very strong and frequent, is wrought and compacted together very firmly, and the thin, smooth, and shining coat which is found upon some of them, seems formed of the slimy matter of the stomach. Among calves, that some have these hair-balls, and others not, seems in one respect owing to their being the first or latter offspring of the creature, since those that suck of a heifer which never had a calf before, take off a large quantity of hair from the paps. There is always found more or less hair in the fourth ventricle of those calves that have sucked young heifers, which has unquestionably been licked off from the paps, and washed down with the milk, and which at times form these balls. See BALLS.

HAIR-LEL, in *Biology*. See HYACINTH.

Hair, *epithelium*, in *Biology*, is the first degree of the Linnæan scale for measuring plants, or the twelfth part of a line.

HAIR-CLOTH, in *Military Affairs*, are large pieces of cloth made with hair hairs; they are used for covering the powder in waggons, or upon batteries; as also for covering charged bombs, or hand-grenades, and many other uses in magazines.

HAIR-pender. See STARCH.

HAIR, *Adiantum*, in *Biology*. See ADIANTUM.

HAIR-worm. See ANTHREZENA.

HAIR-weed, *conferva*, in *Biology*, the name of a genus of algae, or flags, the characters of which are these: it is a water-plant, destitute of flower and seed, so far as has hitherto been observed, and composed only of simple and uniform filaments, which usually extend to a great length, and are often branched, and usually of a cylindrical figure. The generality of authors have supposed that these are not produced of seeds, but are formed of some viscous or gelatinous matter floating in the water, by mere agglutination of parts; but this seems erroneous, and is actually confuted by the discovery of their seeds, and of the fructification of this class of plants, made by Mr. Ellis, as well as in the sea-fucules, and in many other genera of plants supposed formerly to want them. Phil. Trans. vol. XLII. art. 20. p. 424. &c.

The *conferva* are usually divided into several orders, according to the nature of the filaments they consist of. Some consist of equable and even threads, others are knotted or jointed in the manner of a worm, or other such insect. These are called the geniculated *confervæ*, to distinguish them from the other simple ones; and finally, others are composed, as it were, of several globules joined one to another: these last are called the knotty *confervæ*.

Of the first kind, or simple *confervæ*, there are twenty-four species.

Of the second order, or the geniculated *confervæ*, there are fourteen kinds.

Of the third order, or the knotted *confervæ*, there are only eight known species. See CONFERVA, and Tab. XIII.

HAIR, N° 2.

HAIR-worm, in *Zoology*. See CHAETIA.

HAIRS *cradib*. This is accounted the forty-eighth part of an inch.

HAIRY *rami*. See FIBROSE *rami*.

HAKE, in *Ichthyology*, the English name of a fish common in the English and some other seas, and called by authors the *merluccius* and *lucius marinus*.

This fish was used of old dried and salted. Hence the proverb obtains in Kent, *as dry as a hake*. Paroch. Antiqu. 575.

HAKE, or HATCHER. See HATCHER.

HAKEYON, in our *Old Writers*, a military coat of defence.

HALBARD, or HALBERT, in the *Art of War*, an offensive weapon, consisting of a shaft, or staff, five feet long; with a steel head, partly in form of a crescent.

The word is formed of the German *hal*, half; and *bard*, an *halber*. Vollius derives it from the German *halber*: of *hal*, clarity, splendour, and *bard*, as.

The *halbard* was anciently a common weapon in the army; where there were companies of *halbardiers*. It is still carried by the serjeants of foot.

It is called the *Danish ax*, because first bore by the Danes; they carried it on the left shoulder. From the Danes it was derived to the Norw, and from the Scots to the English, and from them to the French.

HALBERT, among *Furriers*, &c. is a piece of iron, an inch broad, and three or four inches long, soldered to the toe of a horse's shoe, that gets out before; to hinder a lame horse from resting or treading upon his toe.

Halbert-hoofs of necessity confirm a lame horse to tread, or rest on his heel, when he paces a moderate pace; which lengthens and draws out his back-sinew, that was somewhat shrunk before.

HALCRYPPIUM, a name given by Dr. Hill to a peculiar salt discovered in the chalybeate waters, and mentioned by Höfman and some other authors, though not before known by any peculiar name.

The word is derived from *hal*, salt, and *crypsis*, to hide, it being the most latent, and with the greatest difficulty discoverable or separable, of the native salts. It is defined to be a salt found naturally in a fluid form, suspended in small quantities in certain waters, scarcely discernible in them by its taste, and very difficultly separable from them; but by a proper evaporation to be produced in a dry form in extremely small particles, in form of powder, which, when carefully prepared by a proper solution and evaporation, affords extremely minute, oblong and quadrangular crystals. Hill, Hist. of Foss. p. 397. It has been long supposed that alkaline salts could not be crystallized; but this salt, the nature of the ancient, and the common borax, show very evidently that we have yet formed but very imperfect ideas of the nature of alkaline salts. The borax flowing up that the supposed invariable properties of alkaline salts are not so constant, certain, and incommunicable as they were supposed to be, as it has some, and has not others of them. See the article BORAX. And this which is a true alkali in many respects; as also the nature of the ancient, being by proper care reducible into regular crystals.

St. Jerome first introduced the word *hallojub* into the church-service: for a considerable time it was only used once a year in the Latin church, viz. at Easter; but in the Greek church it was much more frequent. St. Jerome mentions its being sung at the interments of the dead, which still continues to be in that church, as also on some occasions, in the time of Lent.

In the time of Gregory the Great, it was appointed to be sung all the year round, in the Latin church, which raised some complaints against that pope, as giving too much into the Greek way, and introducing the ceremonies of the church of Constantinople into that of Rome. But he excused himself, by alleging, that this had been the ancient usage of Rome; and that it had been brought from Constantinople at the time when the word *hallojub* was first introduced under pope Damasius.

HALLERIA, in Botany, a genus of the *diagnosis angiosperma* class. This plant, which was named from Dr. Haller, professor of botany at Göttingen, is called by some gardeners the African fly-honey-suckle, from its resemblance to the upright or fly-honey-suckle. Its characters are these: the flower has a permanent empanculation of our leaf, cut into three parts at the top; it has one petal of the grinning kind, whose chops are swollen and inflexed; it has four stamens, which are bristly, two of them longer than the other; in the bottom of the tube is situated an oval germ, which becomes a roundish berry with two cells, each containing one hard seed. There is but one species. Miller.

HALLIARDS, or **HALLYARDS**, in a Ship, are the ropes or tacks usually employed to hoist or lower any sail upon its respective mast, or stay.

HALLIER. See **BRAMBLE-RE**.

HALM. See **HAUM**.

HALMOT, or **HALMOT**, from the Saxon *halm*, *halm*; and *mot*, *meeting*; is the same with what we now call a *court-house*; the word implying, a meeting of the tenants of the same hall or manor.

Omnia causa terminata, vel hundreda, vel comitata, vel halimote, sicut habentur, vel assessorum curia. Ld. Hen. I. cap. 10. *Halimote* and *halimote* are often confounded with *folk-mote*, though originally they were distinct courts. The *halimote* being properly the lord's court, or a court-hold held in the manor, in which differences between the tenants were determined.

The name is still retained at Lathom, and other places in Herefordshire.

HALMOT is sometimes also taken for a convention of citizens in their public hall, more properly called *folk-mote*.

HALMYRAN, a name given by Pliny to the *NATRUM* of the ancients, when found in a dry form on the surface of the earth.

HALMYRHAGA, in the *Materia Medica* of the Ancients, was a name given, by some authors, to the *NATRUM*, when in a purer state. They distinguished, according to Pliny, two kinds of this salt; one they called by this name *halmyrhaga*, which was the purer; the other, which was fouler, and mixed with earth, they called *argyrum*. The first of these they had from Media; the other from Thracia.

HALMYRODES, of *ἀλμυρος, salt*, from *ἀλς, sea*; a word used by Hippocrates, as the name of a peculiar species of fever, in which, as Galen explains it, the external parts, when touched, communicate such an itching sensation, as is perceived on touching salt substances. The same word is sometimes used to express a roughness of the skin, and is applied to many of the excretions, when salt and acrimonious.

HALO, in *Physiology*, a meteor in form of a luminous ring or circle, of various colours, appearing round the bodies of the sun, moon, planets, or fixed stars.

The word is formed of the Greek *ἅλως, of ἅλς, sea*. That round the moon is the most usual, and is also called *crepusculum*.

These *halos* are sometimes white, and sometimes coloured like the rainbow; but their colours are more dilute than those of the rainbow, and they are in a different order, according to their size. Sometimes only one is visible, and sometimes several concentric *halos* or *coronae* appear at the same time. They are very various in their size; those which have been seen about Sirius and Jupiter were never more than 3, 4, or 5 degrees in diameter; those, also, which surround the moon, are sometimes no more than 3 or 4 degrees; but these, as well as those which surround the sun, are of very different magnitudes, some of them being 50°, or even larger, and their diameters vary during the time of observation.

These *halos* are very frequent. Mr. Muschenbroeck says, that in Holland fifty may be seen in the day-time, almost every year: in North America there is generally one or two about the sun every week, and as many about the moon every month. *Halos* round the sun are very com-

mon in Russia. There are several ways of exhibiting phenomena similar to these: the flame of a candle, placed in the middle of a steam in cold weather, or placed at the distance of some feet from a glass window that has been breathed upon, whilst the spectator is also at the distance of some feet from another part of the window, or placed behind a glass receiver, when air is admitted into the vacuum within it to a certain density, will, in each of these circumstances, appear to be encompassed by a coloured *halo*. Mr. Muschenbroeck observed, that when the glass windows of his room were covered with a thin plate of ice, on the inside, the moon appearing through it, was surrounded with a large and variously coloured *halo*; and, opening the window, he found that it arose entirely from that thin plate of ice, because none was seen except through this plate.

Naturalists conceive the *halo* to arise from a refraction of the rays of light in their passing through the fine rare vesiculae of a thin nebula or vapour towards the top of our atmosphere; which account they confirm from hence; that a quantity of water being thrown up against the sun, as it breaks and diffuses into drops, forms a kind of *halo* or *iris*, exhibiting the colours of the natural rainbow.

Descartes observes, that the *halo* never appears when it rains; whence he concludes, that this phenomenon is occasioned by the refraction of light in the round particles of ice, which are then floating in the atmosphere; and to the different protuberance of these particles he ascribes the variation in the diameter of the *halo*. Gassendi supposes, that a *halo* is occasioned in the same manner with the rainbow, the rays of light being, in both cases, twice refracted and once reflected within each drop of rain or vapour, and that the difference between them is wholly owing to their different situation with respect to the observer. Dechales also endeavours to shew, that the generation of the *halo* is similar to that of the rainbow; and the reason, he says, why the colours of the *halo* are more dilute than those of the rainbow, is owing principally to their being formed, not in large drops of rain, but in very small vapour. But the most considerable and generally received theory, relating to the generation of *halos*, is that of Mr. Huygens.

Mr. Huygens supposes *halos*, or circles round the sun, to be formed by small round grains of a kind of hail, made up of two different parts, one of which is opaque, and inclosed in the other, which is transparent; which is the general structure actually observed in hail.

He supposes, that the grains or globules that form these *halos* consisted at first of soft snow, and that they have been rounded by continual agitation in the air, and thawed on their outside by the heat of the sun. In order to illustrate this hypothesis, let ABCD (Tab. II. Opticæ, fig. 27.) represent one of these globules, and EF the kernel of snow in the middle of it; if the rays of light, coming from GH, fall on the side AD, it is manifest they will be so refracted at A and D as to bend inwards, and many of them will strike upon the kernel EF. Other rays, however, as GA and HD, will only touch the sides of the kernel, and being again refracted at B and C, will emerge in the lines BK and CK, crossing each other in the point K; whose nearest distance from the globule is somewhat less than its apparent diameter. If, therefore, BK and CK be produced towards M and L, (fig. 28.) it is evident that no light can reach the eye placed within the angle LKM, but may fall upon it when placed out of that angle, or rather the cone represented by it. For the same reason, every one of these globules will have a shadow behind it, in which the light of the sun will not be perceived. If the eye be at N, and that point be conceived to be the vertex of a cone, the sides of which NR, NQ, are parallel to the sides of the former cone, KL, KM, it is evident that none of the globules within the cone QNR can send any rays of the sun to the eye at N. But any other globule out of this cone, as X, may send those rays, which are more refracted than XZ, to the eye; so that this will appear enlightened, while those within the cone will appear obscure. From hence it appears, that a certain area or space, quite round the sun, must appear dark, and that the space next to this area will appear luminous, and more so in those parts that are nearest to the obscure area; because, Mr. Huygens says, it may easily be demonstrated, that those globules which are nearest to the cone QNR exhibit the largest image of the sun. A corona must be produced in the same manner, whatever be the sun's altitude, because of the spherical figure of the globules. In confirmation of this hypothesis, he directs us to expose to the sun a thin glass bubble, filled with water, and having some opaque substance in the center of it; and he says we shall find, that we shall not be able to see the sun through it, unless at a certain distance from a place opposite to the centre of it; but as soon as we perceive

perceive the light, the image of the sun will immediately appear the brightest, and coloured red, for the same reason as in the rainbow. These coronas, he says, often appear about the moon; but the colours are so weak as to appear only white. The liveliness of the colours depends on the number of globules floating in the atmosphere, and at the same time the area within the coronas will be the darker. The apparent diameter of the corona, which is generally about 45 degrees, depends upon the size of the dark kernel; for the larger this is with respect to the whole globules, the larger will be the dark cone behind it. In order to have the diameter of this magnitude, he proves, that the semi-diameter of the globe must be to the semi-diameter of the kernel of snow very nearly as 1000 to 480; and for a coronas of 100 degrees, it must be as 1000 to 680. Phil. Trans. Abr. vol. ii. p. 180. After the same manner he accounts for the parhelia; only that there he imagines the icy grains of an oblong figure, and rounding at the ends, like cylinders with round convex tops. Where some of these cylinders are in an erect position, the circle they form will be white, because of the reflection of the rays of the sun on the surface of these cylinders.

Mr. Weidler endeavours to refute Huygens's manner of accounting for *halos*, by a vast number of small vapours, each with a snowy nucleus, coated round with a transparent covering. Mr. Weidler says, that when the sun paints its image in the atmosphere, and, by the force of its rays, puts the vapours in motion, and drives them towards the surface, till they are collected in such a quantity, and at such a distance from the sun on each side, that its rays are twice refracted, and twice reflected, by the time they reach the eye; they exhibit the appearance of a *halo*, adorned with the colours of the rainbow; which may happen in globular pellucid vapours without snowy nuclei, as appears by the experiment of hollow glass spheres filled with water; therefore, whenever those spherical vapours are situated as before mentioned, the refractions and reflections will happen every where alike, and the figure of a circular crown, with the usual order of colours, will be the consequence. Phil. Trans. N° 428. p. 2.

The light which comes through drops of rain by two refractions, without any reflection, Dr. Isaac Newton observes, ought to appear strongest at the distance of about 26 degrees from the sun, and to decay gradually both ways, as the distance from him increases and decreases; and the same is to be understood of light, transmitted through spherical hail-stones. And if the hail be a little flattened, as is often the case, the light transmitted may grow so strong at a little less distance than that of 26 degrees, as to form a *halo* about the sun or moon; which *halo*, as often as the hail-stones are duly figured, may be coloured; and then it must be made red within by the least refrangible rays, and blue without by the most refrangible ones, especially if the hail-stones have opaque globules of snow in their centre, to intercept the light within the *halo*, as Huygens has observed, and make the infuse thereof more distinctly defined than it would otherwise be.

Such hail-stones, though spherical, by terminating the light by snow, may make a *halo* red within and colours left without, and darker in the red than without, as *halos* used to be; for of those rays which pass close by the snow, the red is more than the least refracted, and so will come to the eye in the directest lines. Optics, p. 155. Thus Dr. Isaac Newton accounted for the larger and less variable appearances of *halos*; but he considered the less and more variable appearances as depending on the same cause with the colours of this place. If the diameter of a small drop or globe of water be about the tenth part of an inch, so that a red making ray, in passing through the middle of this globe, has 250 fits of easy transmission within the globe; and all the red making rays, which are at a certain distance from this middle ray round about it, have 249 fits within the globe; and all the like rays, as a certain farther distance round about it, have 248 fits; and all those at a certain farther distance 247 fits, and so on; these concentric circles of rays, after their transmission, falling on a white paper, will make concentric rings of red upon the paper, supposing the light which passes through one single globe strong enough to be sensible; and in like manner, the rays of other colours will make rings of other colours. Suppose, now, that in a fair day the sun should shine through this cloud of such globules of water or hail, and that the globules are all of the same size, the sun seen through this cloud ought to appear surrounded with the like concentric rings of colours, and the diameter of the first ring of red should be 71°, that of the second 104°, that of the third 129° 33'; and according as the globules of water are bigger or less, the ring should be less or bigger.

This curious theory was confirmed by actual observation in June, 1692, when the author saw by reflection, in a vessel of stagnant water, three *halos*, coronas, or rings of colour about the sun, like three little rainbows concentric to his body. These coronas included one another immediately, so that their colours proceeded in this continual order from the sun outward: blue, white, red; purple, blue, green, pale yellow, and red; pale blue, pale red. The like coronas appear sometimes about the moon. The more equal the globules of water or ice are to one another, the more coronas of colours will appear, and the colours will be the more lively. Optics, p. 285. M. Maichenbroeck concludes his account of coronas with observing, that some density of vapour, or some thickness of the plates of ice, divides the light in its transmission, either through the small globules of water or their intricacies, into its separate colours; but what that density is, or what is the size of the particles which compose the vapour, he does not pretend to determine. Introd. ad Phil. Nat. p. 1037.

It has been often observed, that a *halo* about the sun or moon does not appear circular and concentric to the sun or moon, but oval and excentric, with its longest diameter perpendicular to the horizon, and extended from the moon farther downwards than upwards: Dr. Smith attributes this phenomenon to the apparent concave of the sky being less than a hemisphere; for by the theory of Huygens, above explained, it appears, that the rays, which cause the visible appearance of *halos*, compute the surface of a *crust*, whose section made by a plane perpendicular to the ray that comes to the eye from the sun or moon, is circular and concentric to the sun or moon; and, therefore, an oblique section of it, made, as it were, by the apparent concavity of the sky, which is the same as the perspective projection of it upon that concave, must be an oval figure. When the angle which the diameter of a *halo* subtends at the eye is 45°, or 60°, and the bottom of the *halo* is near the horizon, and consequently its apparent figure is most oval, the apparent vertical diameter is divided by the moon in the proportion of about two to three or four, and is to the horizontal diameter drawn through the moon as four to three, nearly. See farther on the subject of this article, Puffley's Hist. and Present State of Discoveries relating to Vision, &c. p. 596—613; and Smith's Optics, art. 167. 513, &c. 526, 527, &c.

HALO, in Anatomy, the name given by authors to that round red circle, or arc, about the niple, from its similitude to the circles formed round the sun and moon at certain times, and called *halo*.

HALOSACHNE, formed of *halo*, sea, and *achne*, straw, in the *Materia Medica* of the Ancients, was a name given to a peculiar sea-falt, made by the evaporation of small quantities of sea-water on rocks, by the sun's heat. It is no way differed from the common sea-falt in its qualities or properties, except that it did not crackle so much in the fire; and this was merely owing to its being composed of finer particles, and in form of a sort of powder, in which state even common sea-falt will no more crackle in the fire than this. Hill's Hist. of Foss. p. 366.

Though this, however, was the common appearance of the *halofalts*, it was not its universal one; for it was found sometimes concreted on, or embodied in the alcyonia and other marine productions, and then appeared in a harder form.

HALOSANTHOS, of *halo*, sea, and *santhos*, flower, flower of salt, in the *Materia Medica* of the Ancients, was a substance, though commonly supposed only an effluence of common salt, yet really a bituminous matter mixed with some particles of salt.

It was a tough, viscous, and fatty substance, found swimming on the waters of some springs and rivers, and was of a soft consistence and of a yellow colour; and the same substance is still found in the same places, and that not only yellow, but of various other colours, as blackish, green, or blue; these it takes up, according to the various earths it has washed against on the shores, or the substances mixed among it at its original concretion. The description Dioscorides gives of it is very express; he says it was found swimming on the waters of the Nile, and some lakes, and was of a yellowish colour, very sharp to the taste, fatidic, and of an unpleasant smell. This, though that author did not distinguish to what class of fossils it properly belonged, is enough, however, to teach us what it truly was; and it is something wonderful, that those who have accounted it a salt, should not observe that the same author adds, that it was soluble in oil and not in water. Hill, Hist. Foss. p. 386.

HALSFANG. See **HEALFANG** and **PILLOW**.

HALT, in War, a pause or stop in the march of a military body.

Some derive the word from the Latin *halitus*, breath, it being a frequent occasion of *halting*, to take breath; other

others from *alts*, because in *halts* they raise their pikes, &c. on end.

HALTER, in the *Manège*, a head-stall for a horse, of Hungarian leather, mounted with one, and sometimes two straps, with a second throat-band, if the horse is apt to unhalter himself.

HALTERING, is an excoriation of the pastern, occasioned by the halter's being entangled about the foot, upon the horse's endeavor to rub his neck with his hinder feet. For the cure of this, anoint the place, morning and evening, with equal quantities of linseed oil and brandy, well mixed.

HALTER-STAP or STING, a cord or long strap of leather, made fast to the head-stall and to the manger, to tie the horse.

HALTERISTÆ, in *Antiquis*, a sort of players at *discus*, so denominated from a peculiar kind of *discus*, by the Greeks called *άλτς*, and by the Latins *halter*; *Babes*, and others, take the halter to have been a leaden weight or ball, which the vaulters bore in their hands, to secure and keep themselves more steady in their leaping. Nor will these authors allow of any sort of halter besides this weight; not other *halteris* but these vaulters. Others, as *Comaricus*, *Constantine*, and *Pomus*, will have the halter to be a lump or mass of lead or stone, with a hold or handle fixed to it, by which it might be carried; and that the *halteristæ* were those who exercised themselves in removing these weights from place to place. These authors add, that the weight or ball mentioned by *Isidore*, was not called *άλτς*, *halter*, but *άλτς*, *alter*, which signifies *alter*, *defensor*.

Hier. Mercurialis, in his *Tractate De Arte Gymnastica*, lib. ii. cap. 12. distinguishes two kinds of *halteristæ*; for though there was but one halter, there were two ways of applying it. The one was to throw or pitch it in a certain manner; the other only to hold it out at arm's end; and in this posture to give themselves divers motions, swinging the hands backwards and forwards, &c. according to the engraved figures thereof given us by *Mercurialis*.

The halter was of a cylindrical figure, smaller in the middle (where it was held) by one diameter, than at the two ends. It was about a foot long, and there was one for each hand: it was made either of iron, stone, or lead. *Galen*, de *Tum. Valerit. lib. i. lib. v. and lib. vi.* speaks of this exercise, and shews of what use it is in purging the body of peccant humours; making it equivalent both to purgation and pilules.

HALTING, among *Ferriers*, &c. an irregularity in the motion of a horse, arising from a lameness or other injury in the shoulder, leg, or foot; which leads him to spare the part, or use it too timidly.

An acquaintance with this disorder, in its several circumstances, is a thing of great extent in the affairs of the manège; for which reason we shall add the principal points relating to it. If a horse *halts*, it is either *before*, in which case his complaint lies either in the shoulder, the legs, or feet; or *behind*, where it must lie in the hip, ham, or the like.

1. The signs which indicate it in the *shoulder*, are his not lifting up his leg, but trailing it on the ground, or his casting one leg more than the other, and with his knee in a manner, unbecom. Add, that in turning short he will visibly favour the leg on the same side. Again, if the ailment be found on the shoulder, it must either be in the top of the shoulder-blade, called the *scapula*, which is known by his *shaking* most when a person is on his back, his shrinking much, and offering to bite when gripped and handled about the top of the shoulder-blade, or in the bottom of the shoulder-blade, joining to the marrow-bone, which is the *fore-pitch* of the breast, which is known by his treading his steps thick, and sinking, ready to fall down, when pressed in that part; or in the elbow, which joins the marrow-bone to the leg, which is known by wincing and taking up his foot when pinched there.

2. If the grievance be in the *leg*, it either lies in the knee or pastern joint, which he discovers by refusing to bow the one or the other, and going listly on it; or in the *flank*, which is discovered by some spitting, screw, wind, gall, or other visible malady thereon.

3. If it be in the *foot*, it is either in the coronet, and owing to some strain, or to be distinguished by some tumor or breaking thereon, or its appearing hot and burning to the touch, or in the *hoof*, owing to an over-reach, or the like, and visible to the eye; as also by his treading altogether on his toes; or in the *quarters*, between the middle of the hoof and the heel, which is known by his *shaking* more when on the edge of a bank than when on plain ground. This is sometimes occasioned by being pricked with a nail in the shoeing; and the faulty nail is distinguished by pinching the head of each nail, and the hoof together, with a pair of pincers.

If a horse *halt* behind, from a disorder in the hip or huckle-bone, he will go side-long, and not follow to well with that leg as the other; nor will he turn on that side without favouring the leg; add, that he shews it more in walking on the side of a bank with the worst leg highest.

If a horse has any hidden infirmity, that will bring him to *halt* when he comes to travel well, it may be discovered by running him in hand on a smooth way, at the length of the halter, and observing how he lets down his legs: if he favour none of them, he is to be farther proved, by riding him roundly till heated; then letting him stand still an hour, and after that running him in the hand at halter's length, as before.

HALYNOTE, properly signifies a holy or ecclesiastical court. See *HALMOT*.

There is a court held in London by this name, before the lord-mayor and sheriffs, for regulating the bakers. It was anciently held on the Sunday next before St. Thomas's day, and for this reason called the *halymote*, or holy court. The title thereof runs thus: *Curia sancti martini in Guiballa civitatis Londonie. coram majori & civibus*, &c.

HALYWERC-FOLK anciently signified such persons of the province of Durham as held lands on condition of defending the corpse of St. Cuthbert; and who hereupon claimed the privilege; not to be forced to go out of the bishoprick either by king or bishop.

HAM, a Saxon word, properly signifying a house or dwelling-place.

HAM is also used to denote a street or village.

Hence it is that the names of many of our towns end with it; as Nottingham, Buckingham, Walsingham, &c.

HAM is also a part of the leg of an animal; being the inner or hind part of the knee, or the ply or angle in which the leg and thigh, when bent, incline to each other.

HAM, in *Commerce*, &c. is used for a leg or thigh of pork, dried, seasoned, and prepared to make it keep, and to give it a brisk agreeable flavour.

Westphalia hams, so much in vogue, are prepared by salting them with salt-petre, pressing them in a press eight or ten days, then steeping them in juniper-water, and drying them by the smoke of juniper-wood.

A *ham* may be salted in imitation of those of *Westphalia*, by sprinkling a *ham* of young pork with salt for one day, in order to fetch out the blood; then wiping it dry, and rubbing it with a mixture of a pound of brown sugar, a quarter of a pound of salt-petre, half a pint of bay salt, and three pints of common salt, well stirred together in an iron pan over the fire till they are moderately hot: let it lie three weeks in this salting, and be frequently turned, and then dry it in a chimney.

HAMADRYADES, formed of *ham*, together, and *dryas*, *dryad*, of *ham*, oak, in *Antiquis*, certain fabulous deities revered among the ancient heathens, and believed to preside over woods and forests, and to be inclosed under the bark of oaks.

The *Hamadryades*, *Quadrupes*, were supposed to live and die with the trees they were attached to; as is observed by *Servius* on *Virgil*, *Elog.* 2. ver. 62. after *Macrinus*, the scholiast of *Apollonius*, &c. who mentions other traditions relating thereto.

The poets, however, frequently confound the *Hamadryades* with the *Naiades*, *Nymphæ*, and rural nymphs in general; witness *Catullus*, *Carm.* lxxviii. ver. 23. *Ovid*, *Fast.* iv. 229. *Met.* i. ver. 695. xiv. ver. 628. *Propertius*, *Eleg.* xx. 32. *Virg.* *Ecl.* x. ver. 64. *Georg.* iv. ver. 382, 383.

Feitus calls them *Quercupulane*, as being issued or sprung from oaks.

An ancient poet, *Pherenicus*, in *Atticens*, lib. iii. calls the vine, fig-tree, and other fruit-trees, *Hamadryades*, from the name of their mother the oak.

This common idea among the ancients, of nymphs or intellectual beings annexed to trees, will account for their worshipping of trees, as we find they did, not only from their poets but their historians. *Livy* speaks of an ambassador's addressing himself to an old oak, as to an intelligent person and divine. Lib. iii. § 25.

HAMAMELIS. See *FINCH HALL*.

HAMAXOBII, *HAMAXOBIIANS*, in the *Antient Geography*, a people who had no houses, but lived in carriages.

The word is formed from *hamas*, a carriage or chariot, and *obii*, life.

The *Hamaxobii*, called also *Hamaxobites*, were an ancient people of *Sarmatia Europæa*, inhabiting the southern part of *Moscovy*, who, instead of houses, had a sort of tents made of leather, and fixed on carriages, to be ready for shifting and travel.

HAMBOROUGH COMPANY. See *COMPANY*.

HAMELLIA, in *Botany*, a genus of the pentandria monogynia class; the characters of which are, that the corolla

is divided into five segments, and the fruit is a five-celled berry containing several seeds.

HAMFARE, in our *Old Writers*, a breach of the peace in a house.

HAMELING, or **HAM-FRINGING**, the act of cutting the great tendon, vulgarly called the *hamstring*.

Hamling or *hamling* of dogs, amounts to the same with *excubitation* or *lawing*.

HAMLET, a diminutive of *ham*, signifies a little village, or rather a part of a village.

Spelman, upon these words, shewing the difference between *villa integra* and *villa dimidia* &c. *hamlets*, says, *Hamletus* *vetus*, *quæ mediocritatem sibi optat, non altius se ostendit quâquam caputis plebei non debent fuisse*. The Statute of Exon. 14 Edw. I. mentions this word thus, *Les nemes de toutes les villes & hamlets qui sont en son royaume*. In the ancient MS. *hamlet* is expounded the seat of a freeholder.

HAMMA, *diuisa*, of *am*, *I tin*, a word used, by some chirographical writers, for a knot that fastens a bandage.

HAMMER, an instrument of iron, with a handle of wood used, in most mechanic arts, to beat, stretch, drive, &c. bodies capable of being stretched or extended under the hammer, are said to be *malleable*.

The Latins call it *malleus*, anciently *marialis* or *marculus*; by which name Pliny calls it when he says, that Cynira, son of Agrippa, invented the *hammer* and *pincers*. Hist. Nat. lib. vii. cap. 56. Vide Hardouin, Not. ad loc.

The *hammers* of our great *FORGES* are moved or worked by a water-mill.

HAMMER, in the *Monny*. See *SHOEING-hammer*.

HAMMER *hardening*. See *HARDENING*.

HAMMER of a *clock*. See *CLOCK*.

HAMMER, in *dentistry*. See *MALLEUS* and *EAR*.

HAMMER-headed *fork*. See *SHAKE*.

HAMMER, *yellow*, in *Ornithology*. See *YELLOW Hammer*.

HAMMERING, the act of beating or extending, and fashioning a body under the hammer.

When it is performed on iron heated for the purpose, the smiths usually call it *forging*.

HAMMERING, in *Coining*. A piece of money, or a medal, is said to be *hammered* when struck, and the impression given with a hammer and not with a mill.

For the method of *coining* with the **HAMMER**, see *COINING*.

HAMMOCK, or **HAMAC**, a kind of hanging bed, suspended between two trees, poles, hooks, or the like; much used throughout the West Indies, as also on board of ships. The Indians hang their *hammocks* to trees, and thus secure themselves from wild beasts and insects, which render lying on the ground there very dangerous.

The people of the Caribbee Islands are wonderfully superstitious with regard to their *hammocks*, and do not make them without many ceremonies.

According to F. Plumier, who has often made use of the *hammock* in the Indies, it consists of a large strong coverlet or sheet of coarse cotton, about six feet square: on two opposite sides are loops of the same stuff, through which a string is run, and thereof other loops are formed, all which are tied together with a cord; and thus is the whole fastened to two neighbouring trees in the field, or two hooks in houses.

This kind of couch serves, at the same time, for bed, quilt, sheets, pillow, &c.

The *hammock* used on board of ships is made of a piece of canvas, six feet long and three feet wide, gathered or drawn together at the two ends; there are usually from fourteen to twenty inches in breadth allowed between decks for every *hammock* in a ship of war; but this space must in some measure depend on the number of the crew, &c. In time of battle the *hammocks* and bedding are firmly corded and fixed in the nettings on the quarter-deck, or wherever the men are too much exposed to the view or fire of the enemy.

Mr. Le Cat has contrived a *hammock* of Turkey leather, which may be easily raised or let down, with a sick person in it, by ropes and pulleys. See Phil. Trans. N° 458. § 3.

HAMMON, in the *Hebrew Mythology*. See *AMMON*.

HAMMOSTEUS, the *OSTEOGLOSSA* of the *shoep*.

HAMPER. See *HANAPER*.

HAMSOKEN, the liberty or privilege of a man's own house; also a franchise granted to lords of manors, whereby they hold pleas, and take cognizance of the breach and violation of that immunity; and it likewise signifies *quædam mystica intrinseca in alium deum vi & iugis*. Fleta, lib. cap. 47. In Scotland, violations of this kind are equally punishable with ravishing a woman. And our old records express burglary under the word *hamsoken*.

HAMOE, or **HAMULUS**, a *HOOK*.

*Surgeons also make use of an instrument thus called, to extract the child in difficult labours.

HANAB ALTHALEB, in the *Materia Medica*, a name used, by the ancient Arabian writers, to express the *h-*
Vol. II. N° 164.

cyperium or *pomum amriti*. The meaning of the name is the *wolf-grape*; and the Greeks have called it by an exactly corresponding term, *hycalophyllum*. We generally call it *hyoscyamus*, or the *wolf-peach*. Some have supposed this the name of a plant differing from the *pomum amriti*; but it appears, on a strict enquiry, to be wholly the same. Some of the Greeks have used the word *strychnis* in this sense alone; and Alexander Trallian, in particular, always makes it the name of an esculent plant; but Dioscorides and Theophrastus use it as the common name of the esculent nightshade, and of the poisonous kind.

HANAPER, or **HAMPER**, an office in *Citancery*, under the direction of a *maior*, his deputy and clerks, answering, in some measure, to the *viacum* among the Romans.

HANAPER, *clerk of the*, sometimes styled *warden of the hanaper*, an officer who receives all money due to the king for seals of charters, patents, commissions, and writs, and attends the keeper of the seal daily in term time, and at all time of feasting, and takes into his custody all sealed charters, patents, and the like, which he receives into bags, but anciently, it is supposed, into *hampers*, which gave denomination to the office.

There is also an officer who is *COMPTROLLER* of the *hanaper*.

HANCES, in a *Ship*, are falls or descents of the file-rails, which are placed as banisters in the poop, &c. and down to the gang-way.

HANCES, or **HANIES**, in *Architecture*, are the ends of elliptical arches, which are arcs of smaller circles than the scheme or middle part of the arch.

HAND, *manus*, a part or member of the body of man, making the extremity of the arm.

The mechanism of the hand is very curious; excellently contrived, to fit it for the various uses and occasions, we have for it, and the great number of arts and manufactures it is to be employed in. It consists of a compass of nerves, and little bones joined into each other, which give it a great degree of strength, and at the same time an unusual flexibility, to enable it to handle adjacent bodies, lay hold of them, and grasp them, in order either to draw them toward us or thrust them off. Anaxagoras is represented, by ancient authors, as maintaining, that man owes all his wisdom, knowledge, and superiority over other animals, to the use of his *hands*; Galen represents the matter otherwise; man, according to him, is not the wisest creature, because he has *hands*; but he had *hands* given him because he was the wisest creature; for it was not our *hands* that taught us arts, but our reason. The *hands* are the organs of reason, &c. De Usu Part. lib. i. cap. 3.

The *hand*, among anatomists, extends from the shoulder to the fingers ends: this is called also the *greater hand*. It is divided into three parts. The first reaching from the shoulder to the elbow, properly called the *arm*, *brachium*. The second reaches from the elbow to the wrist. The third is the *hand*, *manus*, properly so called; called also the *lesser hand*, or *extreme manus*. This is subdivided into three other parts: the *carpus*, which is the wrist; the *metacarpus*, which is the body of the *hand*, including the *dorsum* and *vola*; and the fingers, *digitus*. See *CARPUS*, *METACARPUS*, and *FINGERS*.

The muscles whereby the *hand* is moved and directed, are the *palmæ*; the *flexor* and *extensor*, *carpi*, *ulnaris*, and *radialis*; *perforatus*; *perforans*; *humeralis*; *interosus*; *extensor*, *abductor*, and *flexor* of the fingers. See each in its place, *PALMARII*, *FLEXOR*, *EXTENSOR*, &c.

HAND, *cartilages of the*. All the bones of the *carpus*, *metacarpus*, and *fingers*, are clothed over with cartilage, at those places called *cartilagineous surfaces*, in the descriptions of those bones; but in the *fresh* bones they are much thicker, *fatty*, and *whiter*, than in the skeleton. In adult subjects, their figure indeed remains the same in both states, but it changes in the dried bones of younger subjects, particularly those of children. Winslow's Anatomy, p. 143.

HAND, *ligaments of the*. The ligaments of the *carpus* are very numerous. Some of them serve to tie each bone of it to the neighbouring bones in the same rank; and these are so very short as to allow these bones only a very small degree of motion; some of them tie the bones of one row to those of another; these are likewise made up of numbers of filaments, but are not so short as the former, and allow these bones a more manifest motion; and lastly, there are other ligaments of the wrist, by which the three first bones of the first row are connected with those of the arm, and to these may be added those of the second row, by which its bones are connected to those of the *metacarpus*, and to the first phalanx of the thumb. Beside all these short ligaments belonging to each bone, in both rows, the rough surfaces of all the bones, especially of those which form the convexity of the *carpus*, give insertion to a great many ligamentary fasciculi,
10 S which

which are stretched over, and closely united to the former small ligaments, and probably serve to strengthen them: there is likewise a considerable ligament, called the inner transverse ligament of the carpus. It has formerly been called an annular ligament, and may still fully enough retain that name.

The bones of the metacarpus, besides those ligaments by which they are tied to the second row of the bones of the carpus, have several others by which both their bases and heads are connected together. The bases of the third and fourth bones are not so closely connected as the rest, and therefore have a very sensible motion. The heads of these bones are firmly tied to each other by a strong ligament, situated transversely in the palm of the hand, and fixed, by distinct productions, in the neighbouring parts of the heads. The first phalanx of the thumb is fixed to the os trapezium by short ligaments, which pass obliquely over the articulation. The first phalanges of the four fingers are joined to the heads of the metacarpal bones by ligaments like the former, and almost in the same manner. The third phalanx of the thumb is joined to the second, and the second phalanges of the other fingers to the first, and the third to the second, by lateral ligaments, almost in the same manner as the bones of the fore-arm to the os humeri; that is, these ligaments spread from a point fixed in the lateral tubercles of the heads of the phalanges, and are inserted in their other extremity like radii in the bases of the neighbouring phalanges. The two first phalanges of each finger have a strong ligamentary vagina, inserted in the rough lines or ridges, on their flat sides; these vaginæ are lined with a mucilaginous membrane, which runs like a tube from one phalanx to the other, over the articulation. They serve for firmness to the flexor muscles of the fingers, the tendons of which pass through them. Winslow's Anatomy, p. 143.

HAND, location of the. Notwithstanding that the hand is very accurately connected to the ulna and radius, by means of the carpus, and strong ligaments, yet it is liable to luxations, and sometimes suffers them in all directions either outward or inward, or on either side; but is generally not so easy to be luxated sideways, as in the other directions, because of the two processes of the radius and ulna which guard it on each side. The hand is said to be luxated forwards or backwards, when it recedes from the muscles which bend the fingers; and to be luxated backward, when it departs from the muscles which extend the fingers. Much in the same manner also the hand is said to be luxated outwards, when the carpus makes a tumor near the thumb, and a cavity near the little finger; and to be luxated inward, when the contrary of this happens.

To reduce luxations of the hand, it must be sufficiently extended by two assistants, one of which is to lay hold of the hand, and the other of the humerus, pulling in opposite directions; and that part of the extended hand where the sinus is, must be placed on a flat and even table, that whatever sticks up may be depressed into its place; by which method the hand, in whatever part luxated, may be very readily reduced into its natural seat.

It also sometimes happens, that one or two of the eight little bones of the carpus are luxated and dislocated from their natural seat by some external violence. When this happens, there will be perceived a tumor in one part, and a cavity in another, which may be perceived by the feeling, as well as by the sight, and the patient will feel very violent pains. This is a luxation very readily and easily cured, by extending the hand as before directed, and replacing the bone. Heister's Surg. p. 165.

The hand makes the subject of the art of palmistry, which is employed in considering the several lines and eminences of the palm of the hand, their significations, &c. Among the Egyptians, the hand was used as a symbol of strength; among the Romans, it was held a symbol of fidelity; and, accordingly, was consecrated to that goddess, by Numa, with great solemnity.

HAND, in Falconry, is used for the foot of the hawk. To have a clean, strong, slender, glutinous hand, well clawed, are some of the good qualities of a hawk, or falcon.

HAND, in the Manege, is a term variously used. Sometimes it stands for the fore-feet of a horse.

Hand is also used for a division of the horse into two parts, with respect to the rider's hand. The fore-hand includes the head, neck, and fore-quarters; the hind-hand is all the rest of the horse.

Star-hand, or fore-hand, is used for horseman's right hand.

Bridle-hand is the horseman's left hand. Your regular cavalier holds his bridle-hand two or three inches above the pommel of the saddle.

A horseman is said to have no hand, when he only makes use of the bridle unskillfully; not knowing how to give the aids, or helps, of the hand with discretion.

To keep a horse upon the hand, signifies to feel him in the way upon the hand, and to be always prepared to avoid any surprise from him. When the horse obeys and answers the effects of the hand, he is said to *rest well upon the hand*.

A horseman ought to have a *light hand*, i. e. he ought only to feel the horse upon his hand, so as to resist him whenever he attempts to slip from it; and as soon as he has made his resistance, he ought to lower the bridle, instead of cleaving to it.

If a horse, by a too great eagerness to go forward, *presses* too much upon the hand, it ought to be slackened at certain times, and at other times to be kept hard, in order to disappoint him from continually pressing upon the bit. This facility, or liberty, of the horseman, of slackening or stiffening the hand, makes what they call a *good hand*. A horse is said to *serve the hand*, when he does not fear the bridle, but runs away in spite of the rider.

To work a horse upon the hand, is to manage him by the effects of the bridle, without any other helps, except the calves of the legs.

To be heavy upon the hand, is understood of a horse, which, on account of the softness of his neck, the weakness of his back, the largeness of his head, and the weight of his fore-quarters, or his weariness, throws himself upon the bridle, without making any resistance, or effort, to force the horseman's hand.

To make a horse tight upon the hand, and free in the way or *rest*, he must be taught to know the hand by degrees, and gentle methods; the horseman must turn him, or change hands; stop him, and manage with dexterity the reins, or pressure of his mouth, so as to make him suffer cheerfully and freely the effect of the bit-mouth, without resisting or adding heavy upon the hand. The floor, or hand-gallops, teaches horses to be tight upon the hand.

Hand is also used, in many other terms, or phrases of art, belonging to the manege, &c.

Hand, to *lead* or *yield* to, is to slacken the bridle.

Hand, to *hold up*, or *justify* to, is to pull the bridle in.

Hand, to *give a turn* by the, is to turn or change hands upon one track.

Hand, *appui*, or *stay* of the. See APPUI.

Hand, *beat* upon the. See BEAT and CUREK.

Hand, to *press* upon the. See PRESS.

Hand, to *change* the. See CHANGE.

Hand, *effects* of the. See EFFECTS.

Hand, *hasten* the. See HASTE.

Hand, to *feel a horse* upon the. See FEEL.

Hand, *full*, or *full rest* upon the HAND. See APPUI and MOUTH.

Hand, to *have matters covered* in the. See HORSE and MARK.

Hand, to *make a burst* part from the, or suffer him to slip from the hand, is to put on at full speed.

Hand, to *make a horse* part right from the, he should not put himself upon his back or reins, but bring down his hips.

Hands, *all*. A horse is said to turn upon all hands, that is not only for one hand. This is called in French *entier*.

Hand, *harmonic*, in Music, is used, by some writers for the ancient diagrams, or scale of music, upon which they learned to sing.

The reason of the appellation was, that Guido Aretin, upon inventing the notes, *ut, re, mi, fa, sol, la*, disposed them on the fingers of the figure of a hand stretched out. He changed the letters of the alphabet, used till that time to express the notes, for these six syllables, which he took out of the first strophe of the hymn of St. John Baptist, composed by Paulus Diaconus.

Ut quoniam laus re-feratur fidei

Mi-ra gesserum fa-muli tuorum,

Sol-ve pallati la-bili restom.

Sacris Jeronim.

Hand *of justice*, is a sceptre, or baton, a cubit long, having an ivory hand at the extremity thereof; used as an attribute of certain kings, wherewith they are painted in their royal robes; as on the coronation day.

Authors usually call it *virga*. Louis X. of France first took the hand of justice for his device.

Hands, *imposition* of, or *laying on* of HANDS, signifies the conferring of holy orders; a ceremony wherein the hands are laid on the head of another, as a sign of a mission, or of a power given him to exercise the functions of the ministry belonging to the order.

The apostles began to appoint missionaries by the imposition of hands. See IMPOSITION.

Working *an*' HANDS of a thing, signifies the witnessing that a person has no part or concern in an affair; and that he will not be answerable for it. This Plate did in respect of our Saviour's death. In this sense, a man is said to have *clean hands*; because the hands are the chief instruments of action; and particularly a judge does this, to denote that he has not been corrupted by bribes or presents.

HAND, left. To marry with the *left-hand*, is to espouse a woman of inferior degree, whose children, in virtue of such marriage, are not to succeed to the father, nor share with the other children, but are to be contented with what fortune the husband shall appoint them the next day after marriage.

This method of taking *left-handed wives* obtains at this time in Germany.

HAND is also used for the *INDEX* of a clock, watch, or the like, serving to point the hour, &c.

HAND, long, longimanus, a kind of title, or surname, assumed by certain princes. Artaxerxes, the son of Xerxes, and his successor in the Persian empire, was thus designated; as having *hands* so long, that he could touch his knees with them when he stood upright.

HAND, short. See *TACHYGRAPHY*.

HAND, bloody. See *BLOODY HAND*.

HAND is also figuratively used in painting, sculpture, &c. for the manner, or style, of this or that master.

HANDS are borne in coat-armour, *dexter* and *sinister*; that is, right and left; expanded or open; and alter other manners.

Azure, a *dexter hand* couped to the wrist, and extended in pale argent, is borne by the name of *Brome*. Argent, three *sinister hands*, couped to the wrist, gules, by the name of *Maynard*.

Knights BARONETS are to bear in a canton, or in an escutcheon, as they please, the arms of Ulster; viz. in a field argent, a *sinister hand* couped to the wrist, gules.

HAND, or HANDING, in the *Sea-Language*. When a thing is to be delivered away, or passed from one to another, or to be brought to any one, then the word is, *hand it this way*, or that way. *Alas*, when more men are wanted to do any labour, as hoisting, &c. they call for more *hands*, not more men.

Handing the sails is the same operation as *FURLING* them.

HAND in and out, in our *Old Writers*, the name of an unlawful game, now disused and prohibited by the statute 17 Edw. IV. cap. 2.

HAND-barren, in the *Military Art*, is commonly made of hard light wood. It is of great use in fortification, for carrying earth from one place to another, and in a siege, for carrying bombs, or cannon-ball, along the trenches, and for several other uses.

HAND-barren, a pledge, or surety, of the lower rank. *Est quasi vas, non fulgissimum manans, hoc est, miser, seu inferior; nam hand-barren, vel est capitalis, vel superior.* Spelman. See *HEADBOROUGH*.

HAND-breadth, is sometimes used for a measure of three inches.

HAND-cuff, an instrument formed of two circular pieces of iron, each fixed by a hinge on the ends of a short iron bar, which being locked over the wrists of a malefactor, prevents his using his hands.

HAND-grenade. See *GRANADO*.

HAND-over-hand, in *Sea Language*, is an order to the men, who pull upon a rope, to pass their hands alternately one before, or above the other, if they are hoisting, in order to hasten the service. A sailor is said to go *cloit*, *hand-over-hand*, when he ascends into the tops by a single rope, as a throul or back-stay, without the help of the rattings, by the dexterity of throwing one *hand* above the other, and lifting his weight along with it.

HAND-ferme. See *FACT*.

HAND-forks, or hand-fork, a lever, or piece of ash, elm, or other strong wood, five or six feet long, cut this like a wedge at one end, that it may get the easier between things which are to be separated, or under any thing that is to be raised; it is better than a crow of iron, because its length allows a better poise.

Hand-forks are used in ships, to traverse the ordnance, to heave with in a windlass, to weigh up the anchor, &c. The gunners *hand-fork* is shorter and flatter than the other, and armed with two claws, for the purpose of managing the artillery in battle, &c.

HAND, or HANDFUL, is a measure of four inches, by the standard; according to the statute 33 Hen. VIII. cap. 5. *The hand*, among *Yeekers*, is four fingers breadth, and is the measure of the fist clenched; by this the height of horses is measured.

A horse for war should be sixteen or eighteen *hands* high. A *handful* of corn or bran is also understood to be as much grain or bran as two *hands* will hold, when joined together; a quantity frequently ordered to be given horses.

HAND-HABEND, in our *Ancient Customs*, denotes a chief taken in the very fact.

Hand, or hand-habend, from the Saxon *hand*, *hand*, and *habend*, having, is a circumstance of manifest theft, when the party is taken with the mainor, or mainover, i. e. the thing stolen, in his *hand*.

Hand also uses *hand-habend* in the same sense. *Sic Latro manifestus.*

So in *Vicia*, *Partum manifestum* est ubi aliqui laro deprehensus fessius de aliquo latrocínio hand-habund, i. e. back-berinde, et infectus fessius per aliquem ejus res illa fessius, quæ dicitur *Salsburgh*, & tunc licet infessius rem suam perire criminaliter in fessiam. Lib. 1. cap. 38. § 1.

HAND-HABEND also signifies the right which the lord has to judge and determine of this offence in his court.

HANDACOCOA, in *Buany*, a name by which *Pliny*, and some other authors, have called the *trifolium hibernicum*, or flinking trefoil.

HANDGRITH, in our *Old Writers*, peace or protection given by the king with his own hand. *Hæc munus hominum in misericordia regis, infractis sui violatis pait quam per manum suam debet aliam.* Leg. Hen. I.

The word is Saxon, from *hand*, et *grith*, manu, and *grith*, pax.

HANDLING, a term used in respect of fighting cocks; signifying the measuring the girth of them, by gripping one's hands and fingers round the cock's body.

HANDY-war, in our *Old Writers*, a kind of cloth mentioned in Stat. 4 & 5 Edw. 1. cap. 5.

JANG-brader, in *Almanac*. See *STOWS*.

HANGING in chains. See *CHAINS*.

HANGINGS, hangings for rooms, made of arras, tapestry, or the like.

HANG, in our *Old Writers, a term for customary labour to be performed.*

HANK for bank, in *Sea Language*, is a phrase used for two ships which tack and make a progress to windward together.

HANKS, in a *Ship*, are certain wooden rings fixed upon the stays of a ship, whereby to confine the stay-bits to them at different heights. They are a later invention, and much more convenient than the *GROMMETS*, and used instead of them.

HANTELODE, in our *Old Writers*, signifies an arrest.

The word is Saxon; from *hand*, *hand*, and *lod*, i. e. *lod*; manus immisso, because arrests are made by laying hold on the debtor, &c.

HANGWITE, *HANGWITE*, a mulct imposed for the hanging a thief, or felon, without course of law, or even for suffering him to escape out of legal custody.

The word is also written, corruptly, *hangwith*, or *hand-wite*. It is formed from the Saxon *hangian*, i. e. *hang*, and *wite*, mulct, compensation.

HANGWITE, *is la que est, quæ est de burgitis*, in *Royal Charters*, denotes an immunity or freedom from the mulct or penalty above mentioned. *Quæ de laven penda sunt foris sunt lery.*

HANSE, or *HANS*, an ancient name for a society or company of merchants; particularly that of certain cities in Germany, &c. hence called *hanse-towns*.

The word *hanse* is obsolete *High Dutch*, or Teutonic; and signifies, as *Lambecius* observes in his *Origines Hanseburgenses*, *aliam confederatam*, &c. In this sense it is used in two of king John's charters, in 1199, to *Dunwich* in Norfolk, and the city of *York*. Some, as *Werdnaghen*, who has been followed by many later authors, derive it from the three German words, *an-der-fer*, that is, *in the way*, because the first *hanse towns* were all situate on the *sea-coast*; whence the society is said to have been first called *an-der-fer stæten*, that is, *cities on the sea*; and afterwards, by abbreviation, *hanstet*, and *hanse*.

Hanse towns are certain free towns of Germany, and the North, united in strict league, under laws and magistracies of their own appointing, for the better carrying on of commerce, and for their mutual safety and assistance.

This celebrated association, which makes so great a figure in the history of commerce, is supposed by *Werdnaghen* to have commenced in the year 1160, immediately after the incursions and piracies of the Danes, &c. The learned *Lambecius* is of opinion, that it did not properly commence till after the league between *Lubeck* and *Hamburg*, in the year 1241; *Thomius*, in lib. II. Hist. Sui Temp. traces the origin of it to the year 1200; others trace its first rise to the year 1140; but he is of opinion when it will, it was confirmed and re-established in 1236 and 1284; and an extraordinary general assembly was held every ten years, at which they solemnly renewed their league, admitted new members, and excluded old ones, if they were refractory, &c.

At first it only consisted of twelve towns, situate on the coasts of the Baltic sea, or not far from it. But its strength and reputation increasing, scarce any trading city in Europe but desired to be admitted into it. However, it seems to have been a standing rule of this confederacy, that no city should be admitted into the *hanse league*, but such as were either situated on the sea, or on some navigable river, commodious for maritime commerce.

Under our king *Henry III.* who, in the year 1266, made

A considerable grant of immunities to the *hanse* towns; the *hanse* consisted of no less than seventy-two cities: to which were afterwards added several more. France furnished to the confederacy Calais, Rouen, St. Malo, Bourdeaux, Bayonne, and Marcellis; Spain, Barcelona, Seville, and Cadix; England, London; Portugal, Lisbon; the Low Countries, Antwerp, Bruges, Rotterdam, Odens, and Dunkirk; and Italy and Sicily, Messina, Leghorn, and Naples. However, the number of the *hanse* towns, which were properly members of the *hanseatic* league, and contributed to its support, was sixty-four, in the year 1370, which was the period when this mercantile confederacy was in its zenith of power and glory; most of which have long since deserted the league; some about the year 1512, and some afterwards. Besides these there were forty-four towns that were properly allies of the confederacy, and were exempted from annual contributions; and to these several others, such as those above mentioned, were added.

The *hanse* was divided into four classes, or members, which were those of Lubeck, Cologne, Brunswick, and Prussia or Danzick. These four cities were the heads of the four members; and Lubeck was the head of the whole *hanse*.

Besides this, the *hanse* had four principal factories, or staples, called the *companies* of the confederacy; these were at London, Bruges, Norwidge, and Bergen; that of Bruges was afterwards removed to Antwerp. But the first and principal was that of Lubeck, which still remains the head of the association. That of London was called *Guildhall's Tentsorium*, or the *Styl-yard*. The government of the *hanse* was at first aristocratical; then it came under the sole direction of the grand-master of the Teutonic order; and, at length, divers princes and lords made interest for it.

The end of the fourteenth century, and the beginning of the fifteenth, were the most flourishing times of this alliance. These towns were then in a condition to proclaim war against kings: history is not silent as to that they waged against Waldemar king of Denmark, about the year 1348, and against Eric, in 1428; particularly this last, when the *hanseatic* fleet consisted of two hundred and sixty ships, containing about twelve thousand regular troops, besides the seamen.

But the several princes, whose principal cities were entered into the association, began to think it policy to put some bounds to the power, which, in time, might have proved formidable to themselves. The means were easy, and short: each withdrew the merchants of his country from the association; by which in a little time, from the great number of cities it had comprehended, the association found itself sunk to those few which had begun the confederacy; which henceforth was called the *Teutonic hanse*; though these are still so considerable in point of commerce, that they are admitted to make treaties with the greatest kings.

The divisions that were put among them, contributed greatly to their fall: nor must it be forgot, that the establishment of the republic, and commerce of Holland, had its share therein.

The four cities which formed the league, were Lubeck, Cologne, Brunswick, and Danzick, which were called *mother towns*; as these afterwards added thereto, were called *daughters* thereof.

A great number of towns in Germany still retain the title of *hanse towns*; but this is rather an empty title which they affect, than any argument of their continuing to trade under the laws and protection of the ancient alliance; there being scarce any but Lubeck, Hamburg, Bremen, Rostock, Brunswick, and Cologne, that are truly *hanseatic*, and that have deputies at the assemblies held on the common occasions thereof.

The great trade the Dutch maintain with the *hanse towns*, contributes not a little towards maintaining some part of them in their ancient reputation; and it is principally to their alliance with that flourishing republic, that they owe the preservation of their liberties; the success some of them have received from the Dutch having forced them more than once from the enterprizes of the neighbouring princes.

HANSEATIC, something belonging to the alliance, or company of the *HANSE*.

Thus we say, the *hanseatic* body, the *hanseatic* towns, &c.

HANSGRAVE, the title of an officer in Germany. The *hansgrave* is the chief of a company, or society.

The word is compounded of the German *hanse* and *graf*, count. See **GRAVE**.

HAP, or **HAPPY**, in *Law*, signifies, to catch or snatch a thing. Thus we meet with, to *hap* the position of a deed-poll. Littleton, fol. 8. also, to *hap* the rent. If partition be made between two parceners, and more land

be allowed the one than the other, the that hath most of the land charges it to the other, and *happeth* the rent whereon alliance is brought.

HAPPINESS, in *Edicts*. See **GOOD**.

HAQUE, in our *Old Writers*, a little hand-gun, prohibited to be used for defraction of game, &c. by statute 33 Hen. VIII. cap. 6. and 2 & 3 Ed. VI. cap. 12. There is also the *half-haque*, or *demihaque*, within the fold acts.

HAQUENY, **HACKNEY**, an old French word for an ambulating horse.

HAQUEBUT, a kind of fire-arm, otherwise called an *arquebut*, or *arquebuse*.

HARACH, in the *Eastern Revenue*, is a poll-tax laid on the Christians and Jews in Egypt. This had long been in the hands of the janizaries, but of late has got into the power of an officer, called thence the *harach aga*, sent from Constantinople. Before this the Christians paid for a tribe, by expiation with fultan. Scim; and this expiation the Copts say they have in their own hands, it was only two dollars and three quarters a head. The great men conferred to this; and now they pay their two or three quarters, or five and a half, or eleven, according to their substance, each dollar being about half a crown. The persons who pay this are those only who have arrived at the age of sixteen. Pococke's Egypt, p. 173.

HARAKA, in *Buray*, a name used, by some authors, for the *governor*.

HARAM. See **SERAGLIO**.

HARANGUE, a modern French name for a speech, or oration, i. e. a discourse made by an orator in public. Menage derives the word from the Italian *aranga*, which signifies the same; formed, according to Ferrari, from *aranga*, a *just*, or *place of justice*. Others derive it from the Latin *ara*, altar; because the first harangues were made before altars: hence the verse of Juvenal,

Aut Luguberrima rhetoric dictata ad aram.

The word is also frequently used in an ill sense; viz. for a too pompous, prolix, or unseasonable speech or declamation. In Honour the heroes generally *harangue* before they come to fight; as, in England, criminals *harangue* on the scaffold before they die.

HARANKAHA, in the *Alsatia Media*, a name by which some authors have called *ALDOREY*.

HARBINGER, an officer of the king's household, having four yeomen under him, who ride a day's journey before the court when it travels, to provide lodgings, &c.

HARBOUR, a sea-port, or a station where ships may ride safe at anchor.

The word is chiefly applied to those closed and secured with a boom, or chain; and that are furnished with a mole, &c. See **PORT**.

To **HARBOUR**, verb; popularly signifies to lodge, receive, or entertain; or to find a retiring place.

Among hunters, a hart is said to *harbour*, when he goes to rest; whence to *harbour* a deer, is to dislodge him.

HARD beam, in *Buray*. See **HORNEAM**.

HARD bodies, in *Natural History*. By *hard* bodies are understood such bodies as are absolutely inflexible by any shock or collision whatsoever.

This is the common meaning of the term; but Huygens, by *hard* bodies (*corpora dura*) meant what others call perfectly elastic bodies; for he thus expresses himself: *Quicunque sit corpus, corporibus duris, a mutua collisio resistendi cum se invicem impinguntur; penitus, cum corpora duo inter se equalia, aequali celeritate, in adversum adversi sunt motus occurrunt, resistit utrumque eadem qua adversi celeritate*. Huyg. De Motu Corp. ex Percuss. Hypoth. 2. But this hypothesis is consistent only with perfect elasticity, and not with the common supposition of *hardness* or inflexibility, which produces no restitution.

The laws of motion for *hard* bodies are the same as for soft bodies; and these two sorts of bodies might be comprized under the common name of *elastic*.

Some who follow Leibnitz's doctrine, concerning the measure of the moving force of bodies, deny the existence of *hard* or inflexible bodies. And it is so far true, that our experience ever taught us, that there are any such. The *hardest* bodies, to appearance, do not preserve their figures in collision, such bodies being only elastic, yielding to the shock, and then restoring themselves.

Mr. Bernoulli goes so far as to say, that *hardness*, in the vulgar sense, is absolutely impossible, being contrary to the law of CONTINUITY. For supposing two such *hard* bodies of equal masses, and with equal velocities, to meet directly, they must either stop or return after the collision. The first supposition is commonly admitted; but then it follows, that these bodies must instantaneously pass from motion to rest, without going through successive diminutions of their velocities till they stop: but this

is thought to be contrary to the fundamental laws of nature. See Bernoulli Oper. tom. iii. p. 10.
Hence this author rejects perfectly solid and inflexible atoms, which others think a consequence of the impenetrability of matter. See Maupert. Mem. de l'Acad. Berlin. tom. ii. p. 284.

HARD *helfs*, in the *Mange*, is one that is inflexible of whip or spur.

HARD *on-deck*, in Sea Language, denotes the situation of the helm, when it is pulled close to the keel-side of the ship, either to tack or keep her head to the wind, when lying-by, or trying. It expresses also the order to put the helm in this position.

HARD *on-water*, is the order to put the helm close to the weather or windward-side of the ship, and it signifies this position of the helm.

HARDENING, the act of communicating a greater degree of hardness to a body than it had before.

The *hardening* and tempering of iron and steel make a considerable article in the mechanical arts.

There are divers ways of effecting it: as by the hammer, quenching it when hot, in cold water; case hardening, &c. See TEMPERING and STEEL.

HARDENING, hammer, is usually used on iron and steel plates, for saws, springs, rules, &c.

HARDENING, *case*, which is a superficial conversion of iron into steel (see CASE-HARDENING) is thus performed: take cow-horn or hoof, dry it well in an oven, and beat it to powder; put as much bay-falt as of this powder into stale urine, or white-wine vinegar, and mix them well together; cover the iron, or steel, all over with this mixture, and wrap it up in linen, or paste-board, so as the mixture touch every part of the work; then put it in the fire, and blow the coals to it, till the whole lamp have a blood-red heat, but no higher; lastly, take it out, and quench it. See STEEL, under which article other processes for this purpose are described.

HARDENING of timber. The Venetians are famous for the soundness of their ships, which do not rot as those of other nations, but will endure much longer than the others. Tachenius tells us, that the whole secret of this consists in the manner of their *hardening* their timber intended for this service; and that this is done by sinking it in water while green, and leaving it there many years. This prevents the alkali, or that salt which furnishes the alkali in burning, from exhaling afterwards; and by this means the TIMBER becomes almost as incorruptible as stone. It is evident that the exhaling of this salt, and the rotting of wood, have some very great connexion with one another, since the more found any piece of timber is, the more salt it proportionably yields; and the wood which is rotten is found on trial to contain no salt at all. Tachen. Hippocor. Chym.

HARDER, in *Zoology*, a name given by some to a fish of the mullet kind, called by Margrave *PASTOR piscis*.

HARDNESS, *Duritia*, in *Philosophy*, that quality in bodies whereby their parts cohere firmly together, so as to resist the touch.

In this sense, *hardness* coincides with what, on other occasions, we call *frangibility*, and sometimes *solidity* in opposition to *fluidity*.

More strictly speaking, a body is said to be *hard*, when its parts mutually cohere, so as not to yield inwardly, or give way to an external impulse; and therefore are not subject to any motion in respect of each other, without breaking the body. In which sense *hardness* stands opposed to *softness*, where the parts do readily give way.

The Penetrations make *hardness* a secondary quality; as supposing it to arise from *density*, which is a primary one, and to be in proportion thereto.

Its remote causes, according to them, are either heat or cold, according to the diversity of the subject: heat producing *density*, and by that means *hardness* in clay; and cold doing the like in wax.

The Epicurean and corporeal philosophers account for *hardness*, from the figure of the component parts, and their union together. Accordingly, some ascribe it to the atoms, or particles of the body being hooked, and thus mutually catching and hanging upon one another; but this is directly bringing that for an answer, which was the question. For how do those hooked parts cohere?

Again, the Cartesian will have the cohesion of hard bodies effected by rest; that is, by nothing at all.

Sir Isaac Newton shews, that the primary particles of all bodies, whether solid or fluid, are *hard*, perfectly *hard*, and are not capable of being broken or divided by any power in nature.

These particles he maintains to be conjoined together by an attractive power; and according to the circumstances of this attraction, the body is either hard, or soft, or even fluid.

If the particles be so disposed or fitted for each other, as

Vol. II. N° 104.

to touch in large surfaces, such body will be hard; and the more so, as these surfaces are the larger. If, on the contrary, they only touch in small surfaces, the body, by the weakness of the attraction, will remain soft.

HARDS, or **HARDS**, of flax, or **HARDS**, denote the coarsest part separated in the dressing of it, from the tear, or fine stuff.

HARDWIG. See HERNARD.

HARDY *ferre*, a name given by the people in some parts of England to the mus crancus, called more usually the *ferre*, or the *caraw-mus*.

HARL, *Lepus*, in the Linnaean system of *Zoology*, makes a distinct genus of animals, of the order of *gliris*; the characters of which are, that the animals of it have feet made for running, with five toes on the fore ones, and four on the hinder, have very long ears, a short tail, and two cutting teeth in each jaw. Under this GENUS the author takes in all the creatures of the *hare* and rabbit kind.

What is most particular in the *hare* is, that the hinder legs are much longer than the fore ones, and are furnished with extremely strong muscles, by which means the creature, naturally delineated, is furnished with a power of running very swiftly from its pursuers, and of ascending steep places; and on this account the *hare* always makes towards the rising ground when startled. The head is roundish, the eyes prominent, and the upper lip split; its ears are very long; and it is said to sleep with its eyes open, for fear of danger; it lies but all day, but in the night goes out in search of food, and returns to its form by the same way, by which it had left it.

The colour of the *hare* approaches near to that of the ground; and in northern countries this, as well as other animals, changes colour, and becomes white at the beginning of winter, so that they are less conspicuous in the snow; we have accidental instances of white *hares*. The food of this animal is entirely vegetable; and it is particularly fond of pinks, parsley, and birch. The *hare* never pairs; but in the rutting season, which begins in February, the male pursues and discovers the female, by the sagacity of its nose. The female breeds often in the year; goes with young a month, and brings usually two, and sometimes three or four, at a time. *Hares* are very subject to leas, and Linnaeus tells us, that the Dalcarnians make a sort of cloth of the fur, called *fil*, which preserves the wearer from their attacks. The fur of *hares* is a very considerable article in the hat manufacture, and many thousand of the skins are annually imported for that use from Russia and Siberia.

The sportsmen distinguish four sorts of this animal; the one lives in the mountains; the second kind is open fields; a third kind in marshy grounds; and the fourth is a rambling, having no particular fixed spot of residence. It is easy to see that there are no distinctions in the eye of the naturalist; but they have their several properties, according to these differences of place, which are of consequence to the sportsmen. Thus the mountain *hares* are the swiftest of all, and the marsh *hares* the slowest; the field *hares* have a middle degree of swiftness between these; and the rambling *hares* are the most difficult of all others to hunt, for they are not only considerably swift, but they generally know all the coverts and thickets, and have the art to make a thousand doublings and escapes that the others would not think of. See HARE-HUNTING.

Hares and rabbits are very mischievous to new planted orchards, by peeling off the bark of the tender and young trees for their food. They do also the same sort of mischief to nurseries; for the prevention of which, some bind ropes about the trees so to such a height as they are able to reach, some dash them with tar; but though this keeps off the *hares*, it is itself mischievous to the trees; but this hurtful property of it is in some degree taken off by mixing any kind of fat or grease with it, and incorporating them well over the fire. This mixture is to be rubbed over the lower part of the trees in November, and will preserve them till that time the next year, without any danger from these animals. It is only in the hard weather in the winter season, when their food is scarce, that these creatures feed on the bark of trees.

People who have the care of warrens, pretend to an odd way of making *hares* fat when they get them there. This is the stopping up their ears with wax, and rendering them deaf. The *hare* is so timorous a creature, that she is continually listening after every noise, and will run a long way on the least suspicion of danger; so that she always runs in terror, and runs herself out of flesh continually. These are both prevented by her feeding in a safe place, and that without apprehension; and they say she will always readily be fattened in this way.

However delicious the *hare* may be esteemed now, our ancestors thought it a crime to kill it, as we learn from

10 T

Cutlar,

Cedar, Com. lib. v. in which they agreed with the Jews. Among the Romans it was reckoned a great delicacy. Thus Martial, xiii. 92.

Inter quadrupedes gloria prima lepus.

And Horace, in the second satire of his fourth book, extols the wing of the fruitful hare:

Fecunda leporis sapiens fistularum armar.

Though the hare lives on vegetables and water only, yet the habitual excess of this animal exalts its flesh, and renders it somewhat calefactive; and this tendency is much increased, if it is killed immediately after being heated by strong exercise.

HARE, *Lepus*, which inhabits the summits of the highland mountains of Scotland, Norway, Lapland, Russia, Siberia, and the banks of the Volga, has shorter ears, and more slender legs, and is less in size than the common hare. Its hair is soft, and in summer of a grey colour, mixed with a little black and tawny; but in winter the whole animal changes to a snowy whiteness, except the tips and edges of the ears. The alteration of colour begins in September; and in April it resumes its grey coat; but in Greenland it is always white. This species never descends into the vales, nor mixes with the common species; it does not run fast, and is easily tamed; when pursued, it shelters beneath stones, or in the clefts of rocks; it is full of frolic; fond of honey and carraway combs, and is observed to eat its own dung before a storm. Pennant.

The hare of North America differs little in form or colour from that of Europe, but it is a third less; its legs are shorter in proportion to the body; and the fur has a tinge of cinereous; when pursued, it takes refuge in a hollow tree; frequents marshes and meadows, and is very destructive to the turnip and cabbage fields.

HARE, *Javos*, or *Samaria*, or *ma leporinus* of Linnæus, has the same general characters with the *GUINEA*-pig kind; its head is small and slender; its ears prominent, naked, and round; the colour of the upper part of the body is reddish; the breast and belly are white; the legs long, with four toes on the fore-feet, and three on the hind; the tail is short, and the animal is of the size of a hare.

HARE, in *Astronomy*. See *LEVER*.

HARE, *Jun.* See *SILVER*.

HARE, *Jun.* *Uplandus*, in *Rutæ*, a genus of the *pentandria digyna* class. Its characters are these: it is a plant with an umbellated flower; the rays of the principal umbel are thin; the involucre of the great umbel is composed of many leaves; those of the small have five: the flower hath five small heart-shaped petals, which are inflexed, and hath five slender filamina; the germen is situated below the flower, and becomes a roundish compressed fruit, which is channelled, dividing in two parts, containing two oblong channelled seeds. There are several species.

The common hare's ear grows natively in chalky land among wheat in several parts of England; so is seldom admitted into gardens. The leaves and seed of this plant are used in medicine; the herb is esteemed good for dissolving scrophulous tumours, and is by some used for internal ailments, ruptures, and bruises from a fall. Miller.

HARE, *ear*, *helford*. See *PHYLLIS*.

HARE, *fat*, *trifoli*. See *TRIFOLI*.

HARE, *leaves*. See *SOW-THISTLE*.

HARE, *leaves*. See *HIG*; *FRYELL*.

HARENARIA, in *Rutæ*, a name used by some authors for the buckhorn plantain.

HARENGIFORMIS, in *Ichthyography*, a genus of fishes approaching to the herring in shape; the principal character of which is, a serrated line made up of scales running along the bottom of the belly; to which may be added, that the sides and belly are of a bright silver colour, and that the scales are large and loose.

HARENGUS, in *Ichthyology*. See *HERRING*.

HARIOT, or *Hartot*, a due, or service, belonging to the lord at the death of his tenant; consisting of the best beef the tenant had at the time of his decease.

Coke, on Littleton, observes, that *haris* in Saxon is called *hæger*, *q. d.* the lord's *hæger*; here signifying *lord*, and *gear*, *hæger*; which others reject, urging, that *hære*, in Saxon, signifies an army and *gear*, a march, or expedition; and that the Saxon *hæger*, whence we derive our *haris*, signified *preparation for war*, or a *tribute*, or *ransom*, given to the lord of a manor, for his better preparation towards war. Spelman.

By the laws of Canutus, *in De Hereditis*, it appears, that at the death of the great men of this nation, so many horses and arms were to be paid, as they were in their respective life obliged to keep for the king's service. The full establishment, if not introduction, of compulsory *haris* into England, was by the Danes.

But *haris* is now wholly taken for a beaf, which the lord by custom chooses out of all the flocks of his deceased tenant, be it horse, ox, &c. and in some manors, the best piece of plate, jewel, or even the best movable.

HARIOT is of two sorts; viz. **HARIOT *rationis***, where *haris* have been paid time out of mind by custom, after the death of a tenant for life.

In some places, there is a customary composition in money, as ten or twenty shillings in lieu of a *haris*, by which the lord and tenant are both bound, if it be an indubitably ancient custom; but a new composition of this sort will not bind the representatives of either party.

HARIOT *service*, when a tenant holds by such service to pay *haris* at the time of his death; which service is expressed in the deed of feoffment.

For this latter the lord shall diltrain; and for the other he shall seize, and not diltrain.

If the lord purchase part of the tenancy, *haris-service* is extinguished; but it is not so of *haris-rationis*.

HARLE, See GOODANDER, and MORGANIER.

HARLEIAN Collection of Manuscripts, is a valuable collection began near the end of the last century, by Robert Harley, esq. afterwards earl of Oxford, and increased in the year 1721 to near six thousand books, fourteen thousand original charters, and five hundred rolls. This collection was further enlarged by his son, and amounted at his death, in 1741, to eight thousand volumes, and above forty thousand original rolls, charters, letters patent, grants, and other deeds and instruments of great antiquity. By stat. 20 Geo. II. it was enacted, that this collection should be purchased for the sum of ten thousand pounds, and placed and continued in the same repository with the Cottonian library. See *BRITISH MUSEUM*.

HARLEQUIN, in the *Italian Comedy*, a buffoon, dressed in party coloured cloaths; answering much the same purpose as a merry-andrew, or jack-pudding, in our drama, on mountebanks stages, &c. We have also introduced the *harlequin* upon our theatres; and this is one of the standing characters in the modern grotesque, or Pantomime entertainments.

The term took its rise from a famous Italian comedian, who came to Paris under Henry III. and who frequenting the house of M. de Harlay, his companions used to call him *Harlayen*, *q. d.* *little Harlequin*; a name which has descended to all those of the same rank and profession.

HARLOT, a woman given to incontinency; or that makes a habit, or trade, of prostituting her body. See *COURTISAN*.

The word is supposed to be used for the diminutive *whorelet*, a little whore. Others derive it from *Arletto*, mistress to Robert duke of Normandy, and mother to William the Conqueror. Camden derives it from one *Arletto*, concubine to William the Conqueror; others from the Italian *arletto*, a proud whore.

HARMONIA, in Music, &c. See *HARMONY*.

HARMONIA, *Anatomy*, in *Anatomy*, a sort of juncture, or articulation of the bones.

Harmonia is a species of the *synarthrosis*, or juncture intended for absolute rest.

Two bones are said to be joined *per harmoniam*, by *harmonia*, when the juncture is in one uniform, right, or circular line; or when the bones meet with even margins; in contradistinction from *synsura*, where they are indented.

The bones of the upper jaw, and most of the epiphyses, are joined *per harmoniam*.

HARMONICA, HARMONICS, a branch, or division, of the ancient music.

The *harmonica* is that part which considers the differences and proportions of sounds, with respect to acute and grave; in contradistinction from *rhythmica*, and *metreica*.

The only part of their music, the ancients have left us any tolerable account of, is the *harmonica*; which itself is but very general and theoretical. It is defined by Ptolemy, a perceptive power of the differences of sounds, according to acute and grave. Vide Ptolem. p. 1. edit. Wallis.

Mr. Malcolm has made a very industrious and learned enquiry into the *harmonica*, or harmonic principles, of the ancients. They reduced their doctrine into seven parts; viz. of *fundis*, or intervals; of *lystima*, or the genera; of the *tonis*, or modes; of *mutaciones*; and of the *melapodia*. See each considered under its proper article.

HARMONICAL arithmetick, is so much of the theory and doctrine of numbers as relates to making the comparisons, reduction, &c. of musical intervals, which are expressed by numbers, in order to our finding their mutual relations, compositions, and resolutions.

HARMONICAL composition, in its general sense, includes the composition both of harmony and melody; i. e. of notes, or songs, both in a single part, and in several parts.

In its more proper and limited sense, *harmonic composition* is restrained to that of harmony. In which sense it may be defined, the art of disposing and concerting several single parts together, in such manner as to make one agreeable whole.

The art of harmony has been long known under the name of *counterpoint*.

At the time when parts were first introduced, music being then very simple, there were no different notes of time; and the parts were in every note made concord.

This they afterwards called *simple*, or *plain counterpoint*, to distinguish it from another kind, then introduced, wherein notes of different value were introduced, and discords brought in between the parts.

This they called *figurative counterpoint*.

HARMONICAL INTERVAL. See INTERVAL.

HARMONICAL PROPORTION. See HARMONICAL PROPORTION.

HARMONICAL SERIES. is a series of many numbers in continual harmonic proportion.

If there be four or more numbers, whereof every three immediate terms are harmonic, the whole makes an harmonic series, of continual harmonic proportionals; as, 30:36:45:60:72:90.

Or if every four immediately next each other be harmonic, it is also a continual harmonic series, but of another species; as, 3, 4, 6, 9, 18, 36, &c.

HARMONICAL SOUND, is an appellation given by Mr. Sauveur to such sounds as always make a certain determinate number of vibrations, in the time that some other fundamental sound, to which they are referred, makes one vibration.

Harmonical sounds are produced by the parts of chords, &c. which vibrate a certain number of times while the whole chord vibrates once.

By this they are distinguished from the third, fifth, &c. where the relations of the vibrations are four to five, or five to six, or two to three.

The relations of sounds had only been considered in the series of numbers, 1:2, 2:3, 3:4, 4:5, &c. which produced the intervals called octave, fifth, fourth, third, &c. M. Sauveur first considered them in the natural series, 1, 2, 3, 4, &c. and examined the relations of the sounds arising therefrom. The result is, that the first interval, 1:2, is an octave; the second, 1:3, a twelfth; the third, 1:4, a fifteenth, or double octave; the fourth, 1:5, a seventeenth; the fifth, 1:6, a nineteenth, &c.

This new consideration of the relations of sounds is more natural than the old one: it expresses and represents the whole of music, and is, in effect, all the music that nature gives without the assistance of art. The string of a harpsichord, or a bell, besides their general sound, which is proportionate to their length, tension, &c. do also, at the same time, yield other subordinate and acuter sounds, which a nice ear, with a good attention, clearly distinguishes.

These subordinate sounds arise from the particular vibrations of some of the parts of the string, or bell, which are, as it were, detached from the rest, and make separate vibrations: in effect, every half, every third, every fourth, &c. of the chord, performs its vibrations apart, while a general vibration is made of the whole chord. Now all these subordinate sounds are harmonic with regard to the whole sound; the least acute which we hear is octave with the whole sound; the least acute that follows, makes a twelfth with the whole sound; the next a seventeenth, &c. till they grow too acute for the ear to perceive them. Now throughout the whole, we hear no such thing as a sound that makes a fifth, or a third, &c. with regard to the whole sound; none, in short, but what are comprised in the series of harmonic sounds.

Add, that if the breath, or bellows, that blow a wind-instrument, be played stronger and stronger, the tone will be continually raised, but this only in the ratio of the harmonic sounds. So that it appears, that nature, when she makes, as it were, a system of music herself, uses no other but this kind of sounds; and yet they had, till of late, remained unknown to the musicians: not but that they frequently fell into them, but it was only inadvertently, and without knowing what they did. M. Sauveur shews, that the structure of the organ depends entirely on this long unknown principle.

HARMONY, in *Music*, the agreeable result of an union of several musical sounds, heard at one and the same time; or, the mixture of divers sounds, which together have an agreeable effect to the ear.

The word is *synonyma*, formed of the verb *harmonizo*, concorde, congruere, to agree, quadrare, match, &c.

As a continued succession of musical sounds produces melody, so does a continued combination of them produce harmony.

Among the ancients, however, as sometimes also among the moderns, *harmony* is used in the strict sense of consonance; and so is equivalent to the *symphony*.

The words *concord* and *harmony* do really signify the same thing; though custom has made a little difference between them. Concord is the agreeable effect of two sounds in consonance; and *harmony* the effect of any greater number of agreeable sounds in consonance.

Again, *harmony* always implies consonance; but concord is also applied to sounds in succession; though never but where the term can stand agreeably in consonance. The effect of an agreeable succession of several sounds is called *melody*; as that of an agreeable consonance is called *harmony*.

The ancients seem to have been entirely unacquainted with *harmony*, the soul of the modern music. In all their explanations of the melopoeia, they say not one word of the concert or harmony of parts. We have instance, indeed, of their joining several voices, or instruments, in consonance; but then these voices, &c. were not so joined, as that each had a distinct and proper melody, so making a succession of various concords; but they were either unisons, or octaves, in every note; and to all performed the same individual melody, and constituted one song.

When the parts differ, not in the tension of the whole, but in the different relations of the successive notes, it is this that constitutes the modern art of *harmony*.

Harmony is well defined, the sum or result of the combination of two or more concords; i.e. of three or more simple sounds striking the ear altogether; and different compositions of concords make different *harmonies*.

To understand the nature, and determine the number and preference, of *harmonies*; it is to be considered, that in every compound sound, where there are no more than three simple ones, there are three kinds of relations; viz. the primary relation of every simple sound to the fundamental, or grave; whereby they make different degrees of concord with it; the mutual relation of the acute sounds with each other, whereby they mix either concord or discord into the compound; and the secondary relation of the whole, whereby all the terms unite their vibrations, or coincide more or less frequently.

Suppose, e. gr. four sounds, A, B, C, and D, whereof A is the grave; B next; then C; and D the acute. Here, A is the fundamental; and the relations of B, C, and D, to A, are primary relations; so, if B be a third above A, that primary relation is 4 to 5; and if C be a fifth to A, that primary relation is 3 to 4; and if D be an octave to A, that is 2 to 1. For the mutual relations of the acute terms B, C, D, they are had by taking their primary relations to the fundamental, and subtracting each lesser from each greater: thus, B to C is 5 to 6, a third; B to D is 5 to 8, a sixth; &c. Lastly, to find the secondary relation of the whole, seek the least common dividend to all the lesser terms or numbers of the primary relations; i.e. the least number that will be divided by each of them exactly: this is the thing sought; and shews, that all the simple sounds coincide, after so many vibrations of the fundamental as the number expresses.

So, in the preceding example, the lesser terms of the three primary relations are 4, 2, 1, whose least common dividend is 4; consequently, at every fourth vibration of the fundamental, the whole will coincide.

Now *harmony*, we have observed, is a compound sound, consisting of three or more simple sounds. Its proper ingredients are concords; and all discords, at least in the primary and mutual relations, are absolutely forbidden. It is true, discords are used in music; but not for themselves simply, but to set off the concords by their contrast and opposition.

Hence, any number of concords being proposed to stand in primary relation with a common fundamental, we discover whether or no they constitute a perfect *harmony*, by finding their mutual relations. Thus, suppose the following concords, or primary relations, viz. the greater third, fifth, and octave, given, their mutual relations are all concord, and therefore may stand in *harmony*: for the greater third and fifth are to one another as 5:6, a lesser third; the greater third and octave are as 5:8, a lesser sixth; and the fifth and octave are as 3:4, a lesser fourth. But if fourth, fifth, and octave, be proposed, it is evident they cannot stand in *harmony*; because, between the fourth and fifth there is a discord, viz. the ratio 8:9. Again, supposing any number of sounds, which are concord each to the next, from the lowest to the highest, to know if they can stand in *harmony*, we must find the primary, and all the mutual relations, which must all be all concord: to let any number of sounds be as 4:5:6:8, they may stand in *harmony*, because each to each is concord; but the following ones cannot, viz. 4, 6, 9, because 4:9 is discord.

The necessary conditions of all *harmony*, then, are concords in the primary and mutual relations; on which footing, a table is easily formed of all the possible varieties: but

but to determine the preference of *harmness*, the secondary relations are likewise to be considered. The preference of one of the kinds on all the other relations is not the best primary relations that mark the better harmony, for then a fourth and fifth must be better than fourth and sixth; whereas the first two cannot stand together, because of the discord in the mutual relation. Nor does the best secondary relation carry it; for then would a fourth and fifth, whose secondary relation with a common fundamental is 6, be better than a sixth third and fifth, whose secondary relation is 10: but here, also, the preference is due to the better mutual relation. Indeed, the mutual relations depend on the primary, though not to as that the best primary fall always produce the best mutual relation: however, the primary relations are of the most important, and, together with the secondary, they afford us the following rule for determining the preference of *harmony*, viz. comparing two *harmonies*, which have an equal number of terms, that which has the best primary or secondary relations is due to be preferred; but to which, where a difference is in the primary relation of the one, and the fecundity of the other, we have no certain rule. The primary are certainly the most considerable; but how the advantage in these ought to be proportioned to the disadvantage in the other, or *vice versa*, we know not: so that a well tuned ear must be the last resort in these cases.

Harmony is divided into *simple* and *compound*.

HARMONY, *simple*, is that where there is no concord to the fundamental above an octave.

The ingredients of *simple harmony* are the seven simple original concords, of which there can be but eighteen different combinations that are *harmony*, which we give in the following table from Mr. Malouin.

Table of simple HARMONIES.

2dary rel.	2dary rel.
fifth octave; third	fifth; third
fourth octave; third	fifth; third
fifth octave; fourth	fifth; fourth
third octave; third	fifth; third
third octave; third	fifth; third
fifth octave; fourth	fifth; fourth

There are all the possible combinations of the concords that make *harmony*, for the octave is compounded of a fifth and fourth, or a sixth and third, which have a variety of greater and lesser; out of these are the first fix *harmonies* composed: then, the fifth being compounded of the greater third and lesser third, and the sixth of fourth and third, from these proceed the next fix of the table; then an octave joined to each of these fix, makes the last fix.

The perfection of the first twelve is according to the order in the table: of the first six each has below it their preference in ascending order, and the perfection of the next three is given to the two combinations with the first, the first of which is given to the two combinations with the first, whereas that which has the third g is better than the three two combinations with the first, of x_1 of which that which has the fourth is best. For the last six, they are not placed last as being the least perfect, but because they are the most complex, and are the mixtures of the other twelve with each other. In point of perfection they are plainly preferable to the preceding six, as having the very same ingredients, and an octave more.

HARMONY, compound, is that which to the simple harmony of one octave, adds that of another octave.

For the compound harmonies, their variety is easily found out of the combinations of the simple harmonies of several notes.

HARMONY, again, may be divided into that of *concord*,
and that of *discord*.

The *feft* is that we have hitherto confidered, and where-
in nothing but congruities are admitted.

The *found* is that wherein discords are used, intermixed with the concords.

For composition of HARMONY, see HARMONICAL composition.

HARMONY is sometimes also used, in a laxer sense, to denote an agreement, fairness, union, conformity, &c. In music we sometimes apply it to a single voice, when sonorous, clear, and soft; or to a single instrument, when it yields a very agreeable sound. "Thus, we say, the harmony of her voice, of his lute, &c."

In *Matters of Learning*, we use *harmony* for a certain agreement between the several parts of the discourse, which renders the reading thereof agreeable. In this sense we say, *harmonious periods*, &c.

In *Architecture*, *harmony* denotes an agreeable relation between the parts of a building. See SYMMETRY.

In *Painting*, they speak of a *barmany*, both in the or-

denominate and composition, and in the colours of a picture. In the ordinance it signifies the union or connexion between the figures, with respect to the subject of the piece. In the colouring it denotes the union or agreeable mixture of different colours. See COLOURING. M. De la Chambre derives the *larceny* of colours from the false proportions as the *burmery* of sounds. This he illustrates at large, in his treatise *On the Colours of the Rainbow*. On this principle, he lays down green as the most agreeable of colours, corresponding to the octave in music: red, to a fifth; yellow, to a fourth, &c.

HARMONY, or Evangelical HARMONY, is also a title of divers books, composed to shew the uniformity and agreement of the accounts given by the four Evangelists, by reducing them to the order of time in which the events recorded really happened.

The first attempt of this kind is attributed to Tatian or Theophilus of Amioch, under the title of *Diastelaron*, or *of the fear*, in the second century. After his example, divers other *Harmonies* have been composed by Ammonius of Alexandria, Eusebius of Caesarea, Janenius, the Bishop of Ghent, Mr. Toinard, Mr. Whitton, Lamy, Le Clerc, Doddridge, Macknight, Priestley, Newcome, &c. These several *harmonies* have entertained very different opinions with regard to the period of our Lord's public ministry, which have necessarily occasioned a corresponding diversity of different opinions with respect to his death.

Dr. Priestley, in an excellent work of the kind, published in 1777, Mr. adopted the opinion proposed by Mr. Mann, in his *Dissertation on the Times of the Birth and Death of Christ*, and strenuously maintained, that he preached no longer than one year, or one year and a few months. This opinion is, undoubtedly, very ancient: it was the opinion of Origen, and also of Clement Alexandrinus; Irenæus and Tertullian ascribe the same opinion to the Valentines. See Origen. *De Principiis*, lib. 4. sect. 5. apud Oper. tom. i. p. 168. ed. Benedicti. Clem. Alex. Strom. lib. 1. p. 340. ed. 5798. vel apud Oper. tom. 1. p. 405. Irenæus. *Contra Hæreses*, lib. 3. cap. 3. Tertullian. *De Carne et sanguine*, c. 10.

However, it has been objected by others, and particularly by Bishop Newcome, in his *History of the Gospel*, published in 1778, that this period of one year is much too short for the several journeys of our Saviour in Galilee, and the several towns connected with them; and he has offered several arguments to prove the more common opinion, first advanced by Jerome, viz. that our Lord's ministry continued three years and a half, and is divided in that space of time into five Palfovers. Sir Isaac Newton is of opinion, that our Lord's ministry included five Palfovers; the first of which happened A. D. 30, the second A. D. 31, the third A. D. 32, the fourth A. D. 33, and the fifth on Friday, April 23, A. D. 34, answering to the 4724th year of the Julian period. See his *Observations on Prophecy*, book i. chap. xi. p. 142.—168.

HARMONY of the *Spheres*, or *celestial HARMONY*, is a sort of music much spoken of by many of the philosophers and fathers; supposed to be produced by the regular (sweetly-tuned) motions of the stars and planets.

Pyro, Philo, Julius, St. Augustine, St. Ambrose, St. Jerome, Boethius, and many others, are strongly opposed with the opinion of the Platonists, who think extremely of the various impulsive impressions of the heavenly globes upon us: another, which, acting under proper minerals, form a *harmeny*. It is impossible, according to them, that such frigid bodies, moving with so much rapidity, should be silent; on the contrary, the atmosphere, continually impelled by them, must yield a set of sounds proportionate to the Impulsions it receives: consequently, as they do not all run the same circle, nor with one and the same velocity, the different tones arising from the diversity of motions, directed by the hand of the Almighty, must form an admirable symphony or concert. St. Irenæus, St. Basil, and St. Epiphanius, &c. have appeared against this notion.

Pythagoras is supposed to have had a view to the gradation of celestial bodies, in what he taught concerning the *harmony of the spheres*.

A musical chord gives the same notes as one double in length, when the tension or force with which the latter is stretched is quadruple; and the gravity of a planet quadruple of the gravity of a planet at a double distance. In general, that any musical chord may become united to a lesser chord of the same kind, its tension must be increased in the same proportion as the square of its length is greater; and the gravity of a planet may become equal to the gravity of another planet, if its distance from the sun is greater. If, therefore, we should suppose musical chords extended from the centre of each planet, that all these chords must become united

it would be requisite to increase or diminish their tensions in the same proportions as would be sufficient to render the gravities of the planets equal; and from the similitude of those proportions, the celebrated doctrine of the *harmony of the spheres* is supposed to have been derived. Plin. lib. ii. cap. 22. Macrobi. in Somn. Scip. lib. ii. cap. 1. Plotarch. de Animal. Procreatione, §. Timaeo. See Macrobius's view of Newton's Discov. book 1. chap. ii. p. 32. ed. 4to. See GRAVITY.

HARMONY, *pre-established*, a celebrated system of M. Leibnitz, by means whereof he accounts for the union or communication between the soul and body. The philosophers had universally held, that the soul and body act really and physically on each other. Des Cartes first appeared, and showed that the heterogeneity of their nature did not allow of such real union; and that they could only have an apparent one, whereof God is the mediator.

M. Leibnitz, unbiassed with either of these hypotheses, establishes a third. A soul or spirit, he observes, is to have a certain series of thoughts, desires, and wills; a body, which is only a machine, is to have a certain series of motions, to be determined by the combination of its mechanical disposition with the impressions of external objects.

It now, there be found a soul and a body so framed, that the whole series of wills of the soul, and the whole series of motions of the body, exactly correspond; and at the same time, for instance, when the soul desires to go to any place, the two feet move mechanically that way; this soul and body will have a relation to one another, not by any actual union between them, but by the constant and perpetual correspondence of the several actions of both. Now, God puts together this soul and body, which had such a correspondence antecedent to their union; such a *pre-established harmony*. And the same is to be understood of all the other souls and bodies that have been, or ever will be joined.

In effect, the laws of motion in the body, succeeding in the order of efficient causes, do all agree and correspond with the ideas of the soul; so that the body is determined to act at the time when the soul wills. So that upon this hypothesis, the volitions of the mind are followed instantly by the desired motions of the body, not in consequence of those volitions in the least, but of the nice and well-adjusted machinery of the body; and the impressions produced in the senses have no effect on the mind, but the corresponding ideas arise, at that precise time, in consequence of a chain of causes of a different kind; and, therefore, all that men do or say, is no more than the effect of exquisite machinery.

The same principle he extends farther, and makes a *pre-established harmony* between the kingdoms of nature and grace; to account for the kindest communication between them, and make physical and moral evil correspond.

Such is the system of *pre-established harmony*. The author's way of stating and enforcing it, may be seen in his *Essais de Theodicee*. This hypothesis was first published in the *Journal des Savans* of Paris, in 1706, and strenuously defended by Wolfius, who, on this account, was banished by Frederick, king of Prussia; it was opposed by Bayle, in the article *Harmonie* of his Dictionary, and since his time by Newton, Clark, Stahl, &c. See LEIBNITZIAN philosophy.

HARMONY, *in Astronomy*. See HARMONIA.

HARMOS, from *harmos*, *I fit*, a word used by the old medicinal writers, for the flesh growing between the teeth.

HARMOSTES, or **HARMOSTA**, in *Antiquity*, a sort of magistrate among the Spartans, whereof there were several, whose business was to look to the building of citadels, and repairing the forts and fortifications of the cities.

The word is *harmon*, formed of *harmos*, *aptus*, *conveniens*, *I adapt*, *conveni*, &c.

HARMOSYNIANS, *harmoni*, in *Antiquity*, were magistrates among the Spartans, who, after the death of Lycurgus, were appointed to enforce the observance of that law of the Spartan legislator, which required married women to wear a veil when they appeared to the streets, whereby they were distinguished from single females, who were allowed to appear abroad with their faces uncovered.

HARNESS, a complete armour, or the whole equipage and accoutrements of a cavalier heavily armed; as calque, cuirass, &c.

The word is formed of the French *harait*, which some derive from the Greek *harmos*, a *band*, *fit*, because they anciently covered themselves therewith. Du-Cange observes that the word *harnagium* is used in the corrupt

Latin in the same sense, and that it comes from the High Dutch *harnas* or *harnisch*. Others derive it from the Italian *aragile*; others from the Celtic *haras*, a *curse*.

Under king Richard II. it was expressly forbidden all men to ride in *harnais* with lance-pays. Vide Hist. 7 Ric. II. cap. 13. In the statute 2 Hen. VI. cap. 14. *harnais* seems to include all kinds of furniture for defence as well as defence, both of men and horses; as swords, buckles for hats, girdles, &c.

HARNESS is also used for the furniture put on a body, to draw in a coach or waggon, or other carriage; such as collars, leathers, traces, &c.

HARNESSING, in *Fortify*, are swellings or forecuffs on the breasts of coach-horses, occasioned by the galling of the *harnais*. For the cure of this, first cut off the hair about the fore very close, and rub the whole breast with a lather of water and black soap; then wash that part of the breast which is usually covered by the patel with salt water, suffering it to dry of itself. Blisters may be applied to the *harnais* by way of prevention.

HAROT, **HAROT**, or **HAROT**, in the *Norman Custom*. *Clarus de Harro* is a cry or formula of invoking the assistance of justice against the violence of some offender, who, upon hearing the word *harro*, is obliged to desist, on pain of being severely punished for his outrage, and to go with the party before the judge.

The word is commonly derived from *har* and *real*, as being supposed an invocation of the sovereign power, to assist the weak against the strong, on occasion of Raoul first duke of Normandy, about the year 912, who rendered himself venerable to his subjects by the severity of his justice; so that they called on him, even after his death, when they suffered any oppression. Some derive it from Harold, king of Denmark, who, in the year 826, was made grand confessor of justice at Mentz; others from the Danish *har*, *q. d.* help me! a cry raised by the Normans in flying from a king of Denmark, named Roux, who made himself duke of Normandy.

The letters of the French chancery have usually this clause, *Neustant dancur de harro*, &c.

The *harro* had anciently great suit power, that a poor man of the city of Coln, named Affen, in virtue hereof, arrested the corpse of William the Conqueror, in the middle of the funeral procession, till such time as his son Henry had paid the value of the land in question, which was that, whereon the chapel was built where he was interred.

HARP, a musical instrument of the string kind, being of a triangular figure, and placed upright between the legs of the person who plays upon it.

Pappas, and Du-Cange after him, will have the *harp* to have taken its name from the *Arpi*, a people of Italy, who were supposed the first that invented it; and from whom they say it was borrowed by other nations. Menage, &c. derives the word from the Latin *carpa*, and that from the German *herp* or *herp*. Others bring it from the Latin *carpa*, because touched or thrummed with the fingers. Dr. Hickes derives it from *harpo* or *herpo*, which signify the same thing; the first in the language of the Cimbric, the second in that of the Anglo-Saxons. The English priest who wrote the life of St. Dunstan, and who lived with him in the tenth century, says, cap. ii. n. 12. *Sumptis sicut ex more citharon fann, quam puerum ligas leuapam vocamus*; which intimates the word to be Anglo-Saxon.

There is some diversity in the structure of *harps*. That called the *triple harp* has ninety-seven strings or chords, in three rows, extending from C in the tenor cliff, to double G in alt, which make five octaves: the middle row is for the feminoes, and the two outside rows are perfect unisons. On the base side, which is played with the right hand, there are thirty-six strings; on the treble side, twenty-six; and in the middle row, thirty-five strings. There are two rows of pins or screws on the right side, serving to keep the strings tight in their holes, which are fastened at the other end to three rows of pins on the upper side.

The *harp*, within the last forty years, has been in some degree improved, by the addition of eight strings to the union, viz. from E to double F in alt.

This instrument is much played with the finger and thumb of both hands. Its music is much like that of the spinnet, all its strings going from feminoe to feminoe; whence some call it an *inverted spinet*.

It is capable of a much greater degree of perfection than the lute. The editor is indebted to Mr. Evans, a very celebrated performer on this instrument, for the above account of the structure and compass of the Welch *harp*. King David is usually painted with a *harp* in his hands; but we have no testimony in all antiquity, that the Hebrew *harp*, which they call *chomer*, was any thing like ours. On a Hebrew medal of Simon Maccabees we see

two sorts of musical instruments: but they are both of them very different from our *harp*, and only consist of three or four strings. All authors agree, that our *harp* is very different from the *lyra*, *cithara*, or *harbiton*, used among the Romans.

Fortunatus, lib. vii. c. viii. witnesses, that it was an instrument of the barbarians.

*Remanijpe lyra, plaudat tibi barbarus harpa,
Græcorum Adimachus, cithra Britannia sonat.*

HARP, *harp*, a musical instrument of the stringed kind, thus called from its being *harp* about by those who play upon it, like a harp. It is about three feet long; its strings are of brass or steel wire, fixed at one end, and stretched across the sound-board, by screws fixed at the other end. It comprehends four octaves, and the strings are struck with the thumb, the right hand playing the treble, and the left the bass; and, in order to draw the sounds the clearer, the thumbs are armed with a little wire pin.

HARP, *harp*. See *LYRA*'s *harp*.

HARP, in *Mythology*, is the symbol of Apollo.

HARP, in the *Muses*. See *GRAPHE*.

HARP, *harp*. See *LYRA*.

HARPAGIUS, in *Antiquity*. See *ANTAGYNUS*.

HARPAX, a name given by some naturalists to amber, and by some of the chemists to quick-lime, and by others to sulphur.

HARPE, in *Natural History*, the name of a kind of shell-fish of very great beauty. It is of the genus of the *dolium* or *concha globosa*. See *LYRA*.

HARPEGGIATO, or **HARPEGGIO**, in the *Italian Music*, signifies the causing the several sounds of one accord to be heard, not together, but distinctly one after the other, beginning with either at pleasure, but commonly with the lowest.

HARPES, *apertus*, **HARPES**, in *Antiquity*, a rapacious ravenous sort of monstrosity, of the bird kind, mentioned among the poets.

They are represented with wings, ears like bears, bodies like vultures, faces like women, and feet and hands hooked like the talons of birds of prey. See *Virgil*, *Æneid*, lib. iii. who gives a description of them.

The ancients looked on the *Harpes* as a sort of genii or demons. Some make them the daughters of Tethys and Oceanus, the *eris* and *eris*; whence, *Virg.* *Æneid*, it is, that they inhabit an island, half on land and half in water. Valerius Flaccus makes them the daughters of Typhon.

There were three *Harpes*, Aello, Ocypete, and Celoxus, which Iliad Homer calls *Polyætes*. Hesiod, in his *Theogony*, ver. 267, only reckons two, Aello and Ocypete, and makes them the daughters of Thaumias and Electra, affirming that they had wings, and went with the rapidity of the wind. Zephyrus begot of them Balaus and Xanthus, Achilles's horses. Pherceydes relates, that the Boeotians expelled them from the Ægean and Sicilian seas, and pursued them as far as the islands, which he calls *Phææ*, and Homer calls *Phææ*; and which have since been called the *Symphades*.

Vossius, *De Idolol.* lib. iii. cap. 99. p. 63, thinks, that what the ancients have related of the *Harpes*, agrees to no other birds so well as the birds found in the territories of Darien in South America. These animals kill not only birds, but dogs and cats, and prove very troublesome to men by their peckings. But the ancients, as the same Vossius observes, knew nothing of these birds. By the *Harpes*, therefore, he thinks they could mean nothing else but the winds; and that it was on this account they were made daughters of Electra, the daughter of Oceanus. Such is the opinion of the Scholiasts of Apollonius, Hesiod, and Pausanias. Their names, Aello, Ocypete, Celoxus, are supposed to suggest a farther argument of this.

Mr. Bryant supposes that the *Harpes* were a college of priests in Ephyria, who, on account of their repeated acts of violence and cruelty, were driven out of the country; their temple was called *Arpi*, and the evil-spirits, whence the Greeks formed *Æreus*, and he observes farther, that *Harpa*, *Æreus*, was certainly of old the name of a place. *Anal. of Anc. Mythol.* vol. ii. p. 43.

HARPNEER, or **HARPNEER**, an engineer or fisherman, who manages and throws the harping-iron in the whale-fishing. See *WHALE-FISHING*.

HARPING-IRON, **HARPAQ**, **HARPOON**, a sort of dart or spear fastened to a line, wherewith they catch whales and other large fish, as *harpoons*, &c.

The *harping-iron* is a large javelin of forged-iron, generally about twenty ounces in weight, and about two feet long, with a sharp, cutting, triangular point, barbed like that of an arrow. At the upper end is engraven the harpinner's name, near a ring to which the line is fasten-

ed, which they let down as soon as the fish is struck, to give him room to rise, &c. See *WHALE-FISHING*.

The *harpoons* cannot be struck with certainty at any considerable distance; so that unless the harpinner is within a yard of a whale, or directly above, this instrument cannot be used with any great success. In the year 1731, a new sort of gun was invented for shooting the *harpoons* into the bodies of whales at a greater distance than they could be thrown by hand, and this was used for two or three seasons with some success; but further experience has proved the invalidity of this contrivance. It was afterwards proposed to substitute the ancient *BALISTA* in the room of the gun; but the scheme, we believe, terminated in mere speculation. *Phil. Trans.* vol. xlvii. p. 429.

HARPINGS, in a *Ship*, properly denote her breadth at the bow. Some also call the fore part of the wales, which go round the bow, and are fastened into the stem, the *harpings*.

HARPINGS, *etc.* See *CART-HARPINGS*.

HARPOCRATES, in *Mythology*, the son of Isis and Osiris. This is an Egyptian deity, whose distinguishing attribute is, that he is represented with his fingers applied to his mouth, denoting that he is the God of Silence. The statue of this idol was fixed in the entrance of most of the Egyptian temples, and he was commonly exhibited under the figure of a young man naked, crowned with an Egyptian mitre, holding in one hand a cornucopia, and in the other the power of laws, and sometimes brandishing a quiver.

HARPOCRATIONS, a sect of heretics mentioned by Celsus, and the time with *CAROCRATIONS*.

HARPSICHORD, or **HARPSICHORD**, a musical instrument of the string kind, played after the manner of an organ.

The *Italian call it above similes*, and the French *clavichord*. In Latin it is usually called *genus cymbalis*, q. d. large or deep cymbal.

The *harpsichord* is furnished with a set of keys, sometimes two sets. The touching or striking of these keys moves a kind of little jacks, which move a double row of chords or strings of brass or iron, stretched on the table of the instrument over four bridges.

HARQUEBUSS, in our ancient statutes, called also *ARQUEBUSS*, *HAQUEBUT*, or *HAQUEBUT*, is a hand-gun, or a fire-arm of a proper length, &c. to be borne in the arm.

The word is formed of the French *arquebuse*, and that from the Italian, *arabuse*, or *arabuse*, q. d. *arab*, a bow, and *bus*, a hole; on account of the touch-hole, at which the powder is put to prime it, and that it succeeded to the bows of the ancients.

The *arquebuse* is properly a fire-arm, of the ordinary length of a musket or fowling-piece, cocked usually with a wheel. Hannelet prescribes its legitimate length to be forty calibres; and the weight of its ball one ounce seven eighths; its charge of powder as much.

There is also a larger kind, called *harquebuse a croc*, much in the nature of our blunderbusses, used in war for the defence of places, being usually reeled on something when discharged. The first time these instruments were seen was in the imperial army of Bourbon, who drove Donnuver out of the state of Milan: they were to big and heavy, that there were two men to carry them. They are now little used except in some old castles, and by the French in some of their garrisons.

HARMLER, or *Latravator*, a kind of hound, called in Latin *javæ*, from his tracing or chasing by foot; being endowed with an admirable gift of fine-scent, and also very bold in the pursuit of his game.

There are several kinds, all differing in their services; being for the hare, fox, wolf, lion, buck, badger, otter, polecat, weasel, or coney; some in fire, for one game, some for another, &c. See *Dog* and *Hound*.

HARRIGATE, *harigate*, a strong sulphureous water, containing besides sulphur, marine salt and nitre, or nitre only and earth. See *WATER*.

HARRIOT. See *HARLOT*.

HARROW, in *Fortification*, is a GATE made of timber, whose dimensions are commonly fix by four inches, and fix inches distant from each other, well lashed to three or four cross bars, and secured with iron.

HARROW, in *Mythology*, a drag made in a square form, set with long iron teeth, to break the clods of earth after ploughing.

It consists of three parts. 1. The *harrows-belly*, which are the holes where the nails go in. 2. The *flats*, which are the cross-pieces. 3. The *harrows-tines*, pink, or tines, which are great iron nails. Besides these there are, 4. The hook, being the which fastens the horse to them. 5. The coupling, which the *harrows* are tied together.

Harrows have been commonly made to drag, and three of this sort have been constructed of different figures, according

according to the purposes to which they have been applied; however, there have been some contrived with rollers.

HARROW, red, in Botany. See **BEET HARROW.**

HARSCHER, in Botany, the name by which Avicenna, Serapion, and the rest of the Arabian writers, call the *cinara*, or *ARTICHOKE*. Some who have been puzzled for an etymology for the word *harscheok* or *artichok*, as we differently spell it, have supposed that it was derived by corruption from this Arabian word, *harsheh*, which the English physicians, who practised according to the rules of Serapion and Avicenna, might bring into use, and adopt in their own language, as the name of the same plant.

The word *harsheh* seems, however, like the word *cinara*, and all the other names of the artichoke, to take in also another plant of the same kind, called by us the chardoon, a sort of garden thistle, the tender stalks of which are eatied up and blanched, and are eaten by us, and were so by the Greeks. The most moderate accounts of the Persians tell us also, that they eat the young shoots and tender stalks of the *harsheh*, which, as the artichoke plant is not used for blanching in this manner, probably signifies in this sense the chardoon.

HART, in the Fable Lang. a stag or male deer of five years old complete. See **DEER** and **STAG.**

If the king or queen hunt him, and he escape, he is called a *royal hart*.

And if by such hunting he be chased out of the forest, proclamation is commonly made in the place adjacent, that in regard of the pasture the beast now afforded the king or queen, none shall hunt or hinder him from returning to the forest, upon which he is called an *harts-royal* proclamation.

Hart at one year old have no horns, but only bunches; and at two years they are very imperfect, being straight and simple; at three years old they grow out into two spurs, at four, into three; and so increase every year in number of branches, till they are six years old; but after that their age is not to be known by their heads. February and March are the months in which they cast their horns; and, in general, the older does cast them sooner than the young ones. Those that have been injured at rut, or which have been gelded, never cast them at all; if they are gelded while young, they never have any horns; if after their horns are grown, they keep those which they had on at the time as long as they live. The horns of does are reddish, those of some black, and those of others finally are white. The red horns are generally the largest and strongest, the black are usually shorter, and the white are worst of all, being the least solid or strong.

This animal is the most cunning in its care of itself of all the deer kind. It is the most timorous of any, and by its windings and turnings, and other subtilties, as the running among herbs of cattle, often deceives the huntsman, and puts a foul upon the dogs. In the chase, which generally is a long one, he takes over hedge, ditch, river, or whatever covers in his way, nothing stopping him. This creature loses its horns in the spring-time, as the other deer do; but, during the time that it is without them, does not appear, but abides in the thick woods, and only comes out in the night-time for food.

HART-HUTTING. See **HUNTING.**

HART'S-HORN, orna crura. See **HART'S HORN.**

HART'S-HORN, in Botany. See **PLANTAIN.**

HART'S-TONGUE, lingua carnea, in Botany, the name of a genus of plants, the characters of which are: their leaves resemble the tongue of an animal in shape, or are, at least, vulgarly supposed to do so; they are usually plain and simple, but sometimes they are jagged, and in some species they are composed of many segments allied to a milleridge; the flowers are not discovered, but the seeds grow on the under part of the leaf, in several long, falcat, and seemingly bilabate furrows; these are filled with oblong capsules, each of which is furnished with an elastic ring, by the contraction of which they are burst when the seeds are ripe.

The species of *harts-tongue*, enumerated by Mr. Tournefort are five-nine. In the Linnæan system this is a species of *plumula*. See **MICR-ANTH.**

These plants commonly grow from the joints of old walls, where they are moist and shady, and a upon shady mossy banks, but are seldom cultivated in gardens.

Harts-tongue is principally used in disorders of the liver and spleen, being good to dissolve hard fibrous tumours in either; it is also serviceable for the rickets in children, for spitting of blood, and the bloody flux. Dioscorides commends it against the biting of serpents, and Mr. Ray praises it, either given in powder, or a conserve of the green leaves, as particularly useful for hysteria and convulsive fits, and the palpitation of the heart. Miller. Externally applied it cleanses wounds and ulcers.

See HART'S-TONGUE, phyllitis marina, in Natural History, a name given by some authors to a species of sea plant, the leaves of which, in some degree, resemble those of the common *harts-tongue*. It grows on the rocks at great depths and is seldom seen, unless when taken up by the coral fishers; its leaves are sometimes single, sometimes they divide into two; they are of a dusky green colour, and are about two inches in length; they have each a nerve or rib running along the middle; they are very thin and transparent, and are of a sort of cartilaginous structure, and each has several rows of small points on each side of the middle rib, which not exactly resemble the feet upon the leaves of some of the capillary plants; but not on those of the *phyllitis*, or *harts-tongue*, in particular, because they are in that plant not round but oblong, and stand only in a single row on each side of the rib. When this plant is viewed by the microscope, it appears in all parts of the leaf full of little holes, and those which are to plain to the naked eye, are no other way different from the imperceptible ones, but in that they are larger. See **COCHINEAL.**

HART-WORT, flos in Botany. See **WILD ANEMONE.**

HART-WORT, Geranium, in Botany, a genus of the pentandria *dioclea* class. Its characters are: that it hath an umbelliferous flower, the principal umbel consists of many small ones, composed of several rays; the involucre of the greater umbel is composed of narrow leaves, as long as the rays of the umbel; those of the rays are half the length, the umbels are drooping; the flowers have five heart-shaped, indented petals, which are equal, and have each five hair-like filamina, terminated by single funiculi; it has a reniformish germina seated under the flower, supporting two small styles crowned by obtuse stigmas: the germina turns in a roundish compressed fruit longitudinally indented, dividing in two parts, each containing one roundish compressed fruit, with an indented border. There are eight species, which are annual plants, are propagated by seed, and will grow in any soil or situation. Mille. See **SAXIFRAGA.**

HART-WORT, fl. only Euphorbia, in a species of the Euphorbia, or HART'S-WORT.

HART, or STAG-ROD, in the Manege, a sort of stream or diffusion that falls upon the jaws, and the other parts of the forehead of a horse, which hinders him from seeing; sometimes also this distemper affects the parts of the hinder quarters.

HARTANTHE, in the Metris Medicis of the ancient Arabi, was one of the names of the *struthium*, or *lanaria* herb of the Greeks and Romans, a kind of thistle the root of which was used in the cleansing of wool. Avicenna, following the Arabic translation of Dioscorides, extolled in his time, gives, under this name, a description of the leontopodium, and the virtues of the *CREC-MAN*, or low-hair; but he finds out the error himself, and charges it upon the interpreter, acknowledging that in his time *harta-thy*, or *aristolia*, was not a name either of low-hair or of the leontopodium, but of the *fransium*. HARVEST, probably derived from a Saxon word signifying *low-hair*, is that season of the year when the corn is ripe and fit to be reaped and gathered into barns.

HARVEST, fly, in Natural History, the name of a large fly, remarkable for the noise which it makes in the summer-months, and particularly about the time of harvest. The generality of authors have very improperly translated *crada* by the English word grasshopper, but this is extremely erroneous, the *crada* having not the least resemblance to the grasshopper. It is called the *opale* in France, in the provinces of Languedoc, &c. it is very common in that country; Italy and all the hot countries abound with it; and it is in most of these places called by the common people by a name expressing the *harvest-fly*, but in England we have not the insect, and few of us have any notion of what it is. It is probable, that people who found the *crada*, according to the description of ancient writers, fancied the grasshopper must be the same creature, this being of all our insects the most noisy in the summer-months.

The *crada* is a large four-winged fly, its body is short and thick, and its wings long and large; the gross or common *crada* is by far the largest of the known species of four-bodied flies, and the smaller kinds are larger than the harvet.

Aristotle, and the other ancient writers who have treated of the *crada*, have mentioned two species, which they have distinguished by the names of *arctica* and *tettigonia*; these have been commonly understood to mean the two general kinds now known; the *arctica* being our large *crada*, and the *tettigonia* our small ones; but Mr. Raumer has added to these two kinds a third, which is of a middle size between the other two; this he supposes to have been the *tettigonia* of the ancients, and seems very confident that our small kind was wholly unknown to them.

H A R

These three kinds do not only differ in size, but also in colour; the large kind is of a deep and blackish brown, with a little yellow on the breast, and on some of the rings of the body; the middle-sized kind is of a paler brown, and has much more of the yellow in it, particularly it has on the body two cross lines of yellow, which repeat in some for the letter X; the third kind, or smallest of all, are called cicadas by the French; they are very different from both the others, having a red dish call on the body, and more yellow than the largest, and less than the middle kind. These distinctions we owe to Mr. Reaumur, who very candidly acknowledges that he had not so great opportunities of examining the cicadas of different countries as he could have wished; and is of opinion, that farther observations will give us several more kinds of them.

It has been the common opinion, that the noise which the cicada makes was occasioned by a swift motion of the wings and their rubbing against the breast, and the grating of the under pair of wings in their passage against the upper ones; were this the case, there is no reason why the female cicada should not make a noise as well as the male; since she has wings and all the other requisites to singing, according to this system; but in reality the matter is far otherwise, and the bare inspection of the body of the male cicada will show that the noise is owing to other causes. If we are determined to call nothing a voice but the articulation of air thrown from the lungs in its passage through the larynx and other parts, then the cicada has properly indeed no voice; but if we extend the meaning of the term farther, and take in the several sounds made by insects in other manners yet intelligible to other insects, we must allow the cicada has a voice, and a very strong one, the organs of which are not in the lungs and throat, but in the belly. See a particular description of these organs, in Reaumur's Hist. of Insects, vol. ix. p. 28.

Though the female cicada wants the organs of singing of the male, she has however a part in her body which the male has not, and which deserves a peculiar attention. The eggs of the cicada must be lodged in the substance of wood, in order to their happily succeeding in the hatching, and the instrument of the female is intended for the purpose of lodging them properly. A very exact account of this instrument is given at large in Reaumur, to whom we refer the reader.

Most other insects which lodge their eggs in wood, do it in the young shoots and tender branches of shrubs and trees while yet living, where the eggs receive juices and nourishment from the sap. See ROTZKY.

The cicada, on the contrary, knowing that her eggs only want a proper lodgment, not a nourishment, she always lays them in dry or dead sticks. The creature never regards what kind of wood she meets with, but seizes the dead twig of any tree, and bores a row of holes in it, putting an egg into each. These creatures deposit their first exuvia in the nest, and after this they come out at the same hole at which the egg was let in, and they are no sooner out than they fall to the ground, and immediately make their way into it and bury themselves; they live some time under ground in the form of a hexapod worm. After living some time under ground they become transformed into a sort of nymphs, which have also a motive power, and have yet a part of their growth to attain to: these nymphs were well known to the ancients. The creature remains in this nymph state two years, and when the time of its final transformation into the fly state approaches, it leaves the earth, and crawls up the body of the tree, and there fastening itself to some of the branches, it changes into the fly, in the manner that all the other creatures pass into this state, that is, by breaking through the federal covering by means of the repeated infusions of its sap; when the fly first comes out of this case, it is green, hard, and becomes brown by degrees, and in a few hours loses all its first greenish colour.

The cicadas are extremely troublesome, by their noise. In most of the hot countries they are now made no use of any where, but we find that the ancient Egyptians themselves by eating them; they accounted them an excellent dish in all their states, but the nymphs, or tetter-motes, was what they were most fond of; they select them in the fly state, and were so nice as to distinguish their sexes and seasons: they preferred the females when they were full of eggs, and the males before that time, while they were full of lemons. Reaumur ub. supra, p. 236.

HARVEST-HORN, denotes the feast often observed at the close of harvest, and also the long used on that occasion. See DECEMBER.

HARUSPEX, or ARUSPEX, in Antiquity, a sort of priest or diviner, who inspected and considered the entrails of

H A T

beasts, particularly those of victims, to find signs or indications of something he wanted to know. See ARUSPICES.

Cicero, De Divinat. lib. ii. explains the difference between auspex and haruspex.

HASCHE, in Botany, a name by which some authors have called thyme.

HASEL, in Botany. See HAZEL.

HASELA, in Ichthyology, the name of a fresh water fish, of the malacothous, or leather-mouthed kind, called by some a species of the mullet, by others, of the chub, and in many places the halibut; it is a smooth, soft, and small fish, of an oblong and slender body, and seldom exceeding six or seven inches in length. They are caught in lakes and rivers, but those from running waters are esteemed the best, and April and May are accounted the months in which they are in highest season; they are eaten also in June and July, but seldom after these months.

HASINELLAS, in the Glass-making Trade, are a number of hooks fastened to the sides of the working furnace, by means of which the workmen are able to tilt and turn their vessels as they heat them. Nov's Art of Glass, p. 242.

HASSA arbui, in the Materia Medica of the Arabian Physicians, a name given to a plant, the virtues of which they commend on many occasions.

The meaning of the words *hassa arbui* is *virga pistoris*, Shepherd's rod; and hence they have been led to suppose, that the plant we call *virga pistoris*, or *DIAPYCNUS minor*, the smaller tassel, or Shepherd's rod, has the virtues given to the *hassa arbui*, and was the same plant. But though it happens that the names of these two plants agree in signification, there is nothing else in which they agree, the *hassa arbui* being the same plant with the *pygmaea* of the early writers, which, with the epithet of *masculina*, stood for the common knogroff; and when the word *functionum* was added, signified the common epispemus, or heretial, which was called *pygmaea*, for the same reason the knogroff was, that is, because its stalks were composed of a great number of joints. These two plants agree in the virtues of agglutinants and astringents, neither of which virtues our *virga pistoris* has any title to.

HASSELOQUISTIA, in Botany, a genus of the *pentandria digynia* class: the characters of which are, that the disc is hemispheric and uncrested, and that the rays are oval, plane, margined, and convex in the middle; and that the fruit is a smooth seed.

HASSOCK, denotes a base, or cushion made of rushes, to kneel or rest the feet on in churches.

HASTA, or HASTA JURA, among Medallists, signifies a kind of spear or javelin, not fixed, or headed with iron; or rather an ancient sceptre, somewhat longer than ordinary, occasionally given to all the gods.

The *hasta* is supposed a symbol of the goodness of the gods, and of the conduct of providence, which is equally mild and forcible.

HASTA, in some countries, is a measure, or quantity of ground amounting to thirty paces: thus called, according to M. Du-Cange, from the *hastis*, or rod, wherewith it was measured.

HASTATED *bay*, among British. See LEAN.

HASTATI, or HASTARII, among the Romans, soldiers armed with spears, who were always drawn up in the first line of BATTLE.

HASTIL, or QUICKEN your hand, in the Manege, called in French, *tenir le main or hale, haler*, is an expression frequently used by riding-masters, when a scholar works a horse upon voltes, and the master has a mind he should turn his hand quicker to the side on which the horse works; in that if the horse works to the right, he turns quicker with his shoulders to the right; and the contrary is observed, if the horse works to the left.

HASTING-PEAR, a name given by the gardeners, to a species of pear, called also by some, the green child pear; this is a moderately large PEAR, and is longest towards the pedicle; its skin is thin, and of a whitish green; the pulp is melting, and of a sugary flavour. It ripens in July.

HASTIVE, a French term, sometimes used in English for *early*, *forward*, or something that comes before the ordinary time, or season.

The *hastive* fruits are Strawberries and cherries; We have *hastive* pear, &c.

HAT, a covering for the head, worn by the men throughout the western part of Europe.

Hats are chiefly made of hair, wool, Sec. worked, pulled, and fashioned to the figure of the head.

Hats are said to have been first seen about the year 1500, at which time they became of use to country gentlemen riding, &c. F. Daniel relates, that when Charles the

made his public entry into Rouen, in 1449, he had on a hat lined with red velvet, and furnished with a plume, or tuft of feathers; he adds, that it is from this entry, or at least under this reign, that the use of hats and caps is to be dated, which henceforward began to take place of the chaperons and hoods, that had been worn before. In the process of time, from the laity, the clergy also took this part of the habit, but it was looked on as a great abuse, and several regulations were published, forbidding any priest, or religious person, to appear abroad in a hat without coronets, and enjoining them to keep to the use of chaperons, made of black cloth, with decent coronets; if they were poor, they were at least to have coronets fastened to their hats, and this upon penalty of suspension and excommunication. Indeed the use of hats is said to have been of a longer standing among the ecclesiastics of Brittany, by two hundred years, and especially among the canons; but these were no other than a kind of caps, and from hence arose the square caps worn in colleges, &c.

Lobineau observes, that a bishop of Dol, in the twelfth century, zealous for good order, allowed the canons alone to wear such hats; enjoining that if any other person come with them to church, divine service should immediately be suspended. Tom. i. p. 845.

Hats make a very considerable article in commerce: the finest, and those most valued, are made of pure hair of an amphibious animal, called the castor or beaver, frequent in Canada, and other provinces of North America. See BEAVER.

HATS, method of making. Hats, we have observed, are made either of wool, or hair of divers animals, particularly of the castor, hare, rabbit, camel, &c. The process is much the same in all; for which reason we shall content ourselves to instance in that of castors.

The skin of this animal is covered with two kinds of hair; the one long, stiff, glossy, and pretty thin set; this is what renders the skin, or fur, of so much value: the other is short, thick, and soft, which alone is used in hats.

To tear off one of these kinds of hair, and cut the other, the hatters, or rather the women employed for that purpose, make use of two knives, a large one like a shoe-maker's knife, for the long hair; and a smaller, not unlike a vine knife, wherewith they shave, or scrape off, the shorter hair.

When the hair is off, they mix the fluff: to one third of dry castor putting two-thirds of *old cast*, i. e. of hair which has been worn some time by the savages, and card the whole with cards, like those used in the woollen manufactory, only finer; this done, they weigh it, and take more or less, according to the size or thickness of the hat intended. The fluff is now laid on the *burdie*, which is a square table, parallel to the horizon, having longitudinal chinks cut through it; on this hurdle, with an instrument called a *bow*, much like that of a violin, but larger, whose string is worked with a little bow-slick, and thus made to play on the furs, they fly and mix together, the dull and fluff at the same time passing through the chinks; this they reckon one of the most difficult operations in the whole, on account of the justness required in the hand to make the fluff fall precisely together, and that it may be every where of the same thickness. In lieu of a bow, some hatters make use of a sieve, or sieve of hair, through which they pass the fluff.

After this manner they form gores, or two capades, of an oval form, ending in an acute angle at top; and with what fluff remains, they supply and strengthen them in places where they happen to be slenderer than ordinary; though it is to be remembered, that they designedly make them thicker in the brim, near the crown, than toward the circumference, or in the crown itself.

The capades thus finished, they go on to harden them into closer and more consistent flakes by pressing down a *hardening skin*, or leather, thereon; this done, they are carried to the *basin*, which is a sort of bench with an iron plate fitted thereon, and a little fire underneath it; upon which laying one of the hardened capades, sprinkled over with water, and a sort of mould being applied thereon, the heat of the fire, with the water and pressing, embody the matter into a slight hairy sort of fluff, or felt; after which turning up the edges all round the mould, they lay it by, and thus proceed to the other; this finished, the two next are joined together, so as to meet in an angle at the top, and only form one conical cap, after the manner of a manica Hippocratica, or flannel bag.

The hat thus fashioned, they remove it to a large kind of receiver or trough, resembling a mill-bopper, going sloping or narrowing down from the edge or rim, to the bottom, which is a copper kettle, filled with water and grounds, kept hot for that purpose. On the descent or

sloping side, called the *plank*, the fashioned hat, being first dipped in the kettle, is laid, and here they proceed to work it, by rolling and unrolling it again and again, one part after another, first with the hand, and then with a little wooden roller, taking care to dip it from time to time, till at length by thus rolling and thickening it four or five hours, it is reduced to the extent of dimensions of the hat intended. To secure the hands from being injured by this frequent rolling, &c. they usually guard them with a sort of thick gloves.

The hat thus wrought, they proceed to give it the proper form, which is done by laying the conical cap on a wooden disk, of the intended size of the crown of the hat, and thus trying it round with a packthead, called a *commander*: after which with a piece of iron, or copper bent for that purpose, and called a *flangier*, they gradually beat or drive down the commander all round, till it has reached the bottom of the block, and thus is the crown formed; what remains at bottom below the flangier, being the brim.

The hat being now set to dry, they proceed to *finish* it, by holding it over a fire of straw, or the like; then it is *pummed*, or rubbed over with pumice, to take off the coarser knap; then rubbed over afresh with sea-fish to lay the knap a little finer; and lastly, carded with a fine card to raise the fine cotton, with which the hat is afterwards to appear.

Things thus far advanced, the hat is thus sent, upon its block, and tied about with a packthead as before, to be dyed. The dyer's copper is usually very large, holding ten or twelve dozen of hats. The dye, or tincture, is made of logwood, verdigris, copperas, and alder-bark; to which some add galls and fumac.

Here the hat is kept boiling for about three quarters of an hour; then taken out and set to cool, and then returned to the dye, and this for ten or twelve times successively. For the method of dying hats, see DYEING of hats.

The dye being complete, the hat is returned to the hatter, who proceeds to dry it, by hanging it in the top, or roof, of a stove or oven, at the bottom of which is a charcoal fire; when dry, it is to be stiffened, which is done with melted glue or gum senegal, applied thereon by first smearing it, and beating it over with a brush, and then rubbing it with the hand. The next thing is to *steam* it on the *steaming basin*, which is a little hearth, or fire-place, raised three feet high with an iron plate laid over it, exactly covering the hearth; on this plate they first spread cloths, which being sprinkled over with water to secure the hat from burning, the hat is placed brim downwards thereon: when moderately hot, the workman strikes gently on the brim, with the flat of his hand, to make the joinings incorporate and bind so as not to appear; turning it from time to time, this way and that way, and at last overturning and setting it in the crown.

When steamed sufficiently, and dried, they put it again on the block, and brush and *iron* it on a table or bench for the purpose, called the *fall-board*; this they perform with a sort of irons like those commonly used in ironing linen, and heated like them, which being rubbed over and over each part of the hat, with the assistance of the brush, smoothens and gives it a gloss, which is the last operation: nothing now remaining but to clip the edges even with scissors, and sew a lining to the crown.

Hats for women have been made in various forms, of silk, straw, shavings of wood, ivory, feathers, gold, and silver.

HAT is also figuratively used for the dignity of a cardinal or a promotion to that dignity.

In this sense they say, to expect a hat; to claim, or have pretension to the hat, &c.

Pope Innocent IV. first made the hat the symbol or cognizance of the cardinals; enjoining them to wear a red hat, at all ceremonies and processions, as a token of being ready to spill their blood for Jesus Christ. See CARDINAL.

HAT, in Heraldry. See CHAPEAU.

HATCHET, or HITCHET, in the Manufactory of Flax, Hemp, &c. a tool, not unlike a CARD, for dressing and combing them into fine hairs.

They consist of sharp-pointed iron pins, or teeth, set orderly in a board.

Of these there are several sorts, some with finer and shorter teeth, others with them coarser and longer.

HATCHES, in a Ship, a sort of trap-doors in the midship, or between the main-mast and fore-mast, through which goods of bulk are let down into the hold. There are several of these square or oblong passages in the deck of a ship, leading from one deck to another, and into the hold or lower apartments. Hence the

HATCH-way is that place where the hatches are. See TUB. Ship. fig. 2. n. 42.

HAT

To lay any thing in the *hatch* way, is to put it so that the *hatch* cannot be come at, or opened.

HATCHES, openings of the. See COAMINGS.

HATCHES are also flood-gates, let in a river, &c. to stop the current of water.

The word is particularly used for certain dams, or mounds, made of rubbish, clay, or earth, to prevent the water that issues from the stream-works, and tin-walves in Cornwall, from running into the fresh rivers.

The tenants of Blythlake, and other manors, are bound to do certain days work to the *hatches*.

HATCHES, in *Mining*, a term used in Cornwall, to express any of the openings of the earth, either into mines, or in search of them; the fruitless openings are called *effay hatches*; the real mouths of the veins, *run-hatches*; and the places where they wind up the buckets of the ore, *wind-hatches*.

HATCHET, an instrument wherewith to hew wood. The *hatchet* is a smaller, lighter sort of ax, with a ball edge on its left side; having a short handle, as being to be used with one hand.

HATCHET, a small ax, used by the pioneers, who go before to prepare the way for an army, by cutting down hedges, bushes, styles, or gates. The grenadiers carry sometimes each a *but* by his side; and the French dragons, who have but one pistol, have a *hatchet* hanging at their saddle bows, on the right side.

HATCHET cuts in *Biology*. See *VEGET.*

HATCHING, the act whereby fecundated eggs, after feasible incubation, exclude their young.

Hatching, with respect to the wondrous tribe, amounts to the same is parturition, or delivery, in the virgiparous. In Egypt they hatch all their chickens by the heat of an oven: the method whereof is given us by Mr. Graevius, in the Philosophical Transactions, N^o 117, or Abridgement, vol. II. p. 851, &c.

They have houses built for this purpose, having a long entrance, on each side whereof are twelve or fourteen ovens, whose bottoms and sides are formed of sundried bricks, lined with mats for the eggs to lie on; and the tops covered with flocks, except two spaces, which are brick, and serve as hearths to build the fires on wherewith the eggs are to be heated; over these is another story of ovens, having holes, which are either stopped with tow, or left open at pleasure, to govern the heat of the ovens below.

They begin to heat the ovens in the middle of January, spending on them every morning about a hundred pound weight of camels, or buffaloes dung, and the like quantity at night, till the middle of February; by which time the ovens are too hot for the hand to be held to the walls. After this they put in the eggs to hatch, which they continue successively to the end of May.

The eggs are first put upon the mats in the lower ovens, upon the ground, 7 or 8000 eggs in number, and laid only double one upon another: in the ovens over these, the fire is made in the little channels, from whence the heat is conveyed into the lower; the eggs directly under these hearths be the first.

At night when they new-make their fires in their hearths, they remove the eggs that were directly undermost, laying three upon one another, in the place of those which lay on the sides only double; and these being now removed, they lie double under the hearth, because the heat is greater there than on the sides.

These eggs continue in the lower ovens fourteen days and nights; after which they remove them into the upper; and in these, there being no more fire used, they turn the eggs four times every twenty-four hours.

The 21st, or 22d day the chickens are *hatched*, which the first day do not exit; the second day they are fetched away by women who give them corn, &c. The master of the ovens hath a third part of the eggs for his cost and pains, out of which he is to make good to the owners (who have two thirds in chickens for their eggs) if any happen to be spoiled or misferry.

The fire in the upper ovens, when the eggs are placed in the lower, is thus proportioned: the first day there is the greatest fire, the second less than the first; the fourth more than the third, the fifth less; the sixth more than the fifth; the seventh less; the eighth more, the ninth without fire; the tenth a little fire in the morning; the eleventh they shut all the holes with flax, &c. making no more fire; for if they should, the eggs would break. They take care that the eggs be no hotter than the eye of a man, when they are laid upon it, can well endure. When the chickens are *hatched*, they put them into the lower oven.

The number of these ovens in different parts of the country, which are attended by the inhabitants of a village called Bernal, is about 386, and they usually keep them at work for six months; as, therefore, each

HAT

brood is perfected in twenty-one days, it is easy to see every one of them to hatch eight different broods of chickens. If we suppose that only two thirds of the eggs are *hatched*, and each brood consists of at least 30000 chickens, the ovens of Egypt are capable of producing, yearly, at least 92640000 chickens.

Mr. Reaumur has discovered, that the heat necessary for this purpose, is nearly the same with that marked 37, upon his thermometer, or that marked 66 on Fahrenheit's. If, therefore, these eggs be kept in this degree of heat, they will as certainly hatch, as if the parent-hen had sat upon them; and indeed it is impossible it should be otherwise, since this heat answers nearly to that of the skin of the hen, or even of mankind; so that the empress Lydia, as Pliny relates, might truly hatch a chicken in her bosom, if she had but the patience to keep an egg there for the same number of days that it ought to have continued under a hen.

After many experiments, Mr. Reaumur found, that flocks heated by means of a baker's oven, succeeded equally well with those made hot by layers of dung. The furnaces of glass-houses, and those of the melters of metals, might no doubt be made to answer the same purpose; if, therefore, an easy method could be found to regulate the heat of the stove, it would be extremely convenient for bakers or pastry-cooks to hatch, with little or no expense, a very great number of chickens, which they might dispose of to the country people, to be reared till marketable. Should a thermometer be judged necessary for this purpose, it will be sufficient to mark on it only such degrees as are absolutely necessary; by which means the instrument will not only come cheaper, but be more readily understood by the ignorant people, for whose use it is designed.

Such an instrument however may be wholly dispensed with; a lump of butter, of the size of a walnut, melted with half as much tallow, serving to indicate the heat of the stove with sufficient exactness; when the heat is too great, this mixture, which is kept in a phial, will become as liquid as oil; and when the heat is too small, it will remain fixed in a lump; but it will flow like thick syrup, upon inclining the bottle, if the stove be of a right temper: great attention therefore should be given to keep the heat always at this degree, by letting in fresh air, if it be too great, or shutting the stove more close, if it be too small.

But this is not all. That all the eggs in the stove may equally share the irregularities of the heat, it will be necessary to shift them from the sides to the centre, and *vice versa*; thereby imitating what the hens themselves do by those upon which they sit; for hens are frequently seen to make use of their bills to push to the outer parts those eggs which were nearest to the middle part of their nest, and to bring into that middle part such as before lay nearest to the sides of the same.

As to the form of the stove, no great nicety is necessary; a chamber over an oven will do very well, only in order to ascertain the due degree of heat, it will be necessary to have phials of butter, as directed above, in several parts of the room; and when the heat wants to be either increased or diminished, it is sufficient to diminish or increase the communication between the air in the room and that abroad, by opening or shutting some of the openings made in the wall for that purpose.

In order to cherish the new *hatched* chickens, capons may be taught to tend them in the same manner as hens do. Mr. Reaumur tells us, that he has seen above two hundred chickens at once, all fed about and defended by only three or four such capons, which clucked like hens, to call in the chickens that had strayed too far off; and even redoubled their call, when they found any nice bits, to invite the young brood to come and pick them up: my cocks may be taught to do the same office, which they as well as capons will continue to do all their lives afterwards. But Mr. Reaumur, not satisfied with the assistance he could procure from cocks and capons, has invented a sort of low boxes without bottoms, and lined with furs; these, which he calls artificial parents, not only shelter the chickens from the injuries of the air, but afford a kindly warmth, so that they presently grow fond of them, and take the benefit of their shelter as readily as they would have done under the wings of a hen.

For a few weeks after *hatching*, it will be necessary to keep the chickens in a room artificially heated, and furnished with these boxes; but afterwards they may be safely exposed to the air in the court-yard, in which it may not be amiss to place one of these artificial parents to shelter them, should there be any occasion.

As to the manner of feeding the young brood, they are generally a whole day after being *hatched*, before they take any food at all; and then a few crumbs of bread may be given them for a day or two, or millet seed

mixed with the crumbs; after which they will begin to pick up insects and grubs for themselves.

People in the country, who have plenty of conveniences for the raising of poultry, will hardly give themselves the trouble to hatch *chickens* in this artificial manner. It is in villages near great towns, and principally in the neighbourhood of the capital city, that it would be of the greatest importance to promote the establishment of this kind of fowls. Vide Mr. Trembley's Abstract of the Art of Hatching domestic Fowls, translated from the original Treatise of Mr. Reaumur, where he explains every difficulty.

HATCHING of bees. See *Generation of Bees*.

HATCHING, or HACHING, in Delighting and Engraving, signifies the making of lines with a pen, pencil, graver, or the like; and intersecting, or going across those lines, with others drawn over them another way.

The depths and shadows of draughts are usually formed by hatching or hatch-work. See *ENGRAVING and ETCHING*.

HATCHING, among Miners. See *DIGGING*.

HATCHINGS are of great use in heraldry, to distinguish the several colours of an escutcheon, without its being illuminated.

The first kind of hatching in pale, or from top to bottom, signifies *gules*, or red; the second in fess, across the coat, *azure*, or blue.

Hatching in pale, counter-hatched in fess, signifies *sable*, or black. Hatching in bend, proceeding from right to left, signifies *green*; and that in bars, from left to right, *purpure*.

When the coat is only dotted, it is supposed to be *er*, or gold; and when quite bare or void, *argent*, or white.

This invention is commonly ascribed to F. Pierre Sancta, to whom the *Seur de la Colombe* has disputed his title to it.

HATCHMENT, in Heraldry, the marshalling of several coats of arms in an escutcheon.

HATCHMENT is also a popular name for an *ATCHEVEMENT*.

By these hatchments or funeral escutcheons, it may be known after any person's decease, what rank either he or she held when living; and if it be a gentleman's hatchment, whether he was a bachelor, married man, or widower, with the like distinctions for gentlemen. In the hatchment, (Tab. IV. Heraldry, fig. 123.) are represented the arms of a private gentleman and his wife parted per pale, the dexter side, which is *gules*, three bars *er*, for the husband; having the ground without the escutcheon black, which denotes the man to be dead; and the ground on the sinister side being white signifies that the wife is living. When a married gentleman dies first, the hatchment is distinguished by a contrary colour from the former; thus, if the arms on the sinister side have the ground without the escutcheon black, whereas those on the dexter side, for her surviving husband, are upon a white ground; besides, the hatchment of a gentleman is distinguished by a cherub over the arms instead of a crest. See fig. 124. When a bachelor dies, his arms may be depicted single or quartered, with a crest over them, but never impaled as the others are; and the whole ground without the escutcheon is black. See fig. 125. When a maid dies, her arms, which are placed in a lozenge, may be single or quartered, have the whole ground black, and instead of a crest have a cherub over them. See fig. 126. When a widower dies, his arms are depicted impaled with those of his deceased wife, having a helmet, mantling and crest over them, and the whole ground without the escutcheon black. See fig. 127. When a widow dies, her arms are impaled with those of her deceased husband, but inclosed in a lozenge, over them is placed a cherub instead of a crest, and the whole ground without the escutcheon is black. See fig. 128. If a widower or bachelor should be the last of his family, the hatchment is depicted as in fig. 129, and that of a maid or widow, whose family is extinct by her death, is depicted as in fig. 130, having a death-head generally annexed to each hatchment, denoting that death has conquered all. The same rules are observed with respect to the escutcheons placed on the hearse and horses used in pompous funerals, except that they are not surmounted with crests but always plain; however, herald-painters commonly enlign those of peers with coronets, and that of a maiden lady with a knot of ribbands. Pomey's El. of Her. p. 240, &c.

HATCHMENTS, in Ecclesiastical History, the name of a modern Dutch sect, so called from Pontian Van Hattem, a minister in the province of Zealand, towards the close of the last century, who being addicted to the sentiments of Spinoza, was on that account, degraded from his pastoral office. The *VERBORSTEN* and *Hatchments* resemble each other in their religious systems, though they

never so entirely agreed as to form one communion. The founders of these sects deduced from the doctrines of absolute decrees, a system of fatal and uncontrollable necessity; they denied the difference between moral good and evil, and the corruption of human nature: from hence they further concluded, that mankind were under no sort of obligation to correct their manners, to improve their minds, or to obey the divine laws; that the whole of religion consisted not in acting but in suffering; and that all the precepts of Jesus Christ are reducible to this one, that we bear with cheerfulness and patience the events that happen to us through the divine will, and make it our constant and only study to maintain a permanent tranquility of mind. Thus far they agreed; but the *Hatchments* farther asserted, that Christ made no expiation for the sins of men by his death, but had only suggested to us by his mediation, that there was nothing in us that could offend the deity; this, they say, was Christ's manner of justifying his servants, and presenting them blameless before the tribunal of God. It was one of their distinguished tenets, that God does not punish men for their sins, but by their sins. These two sects, says Melheim, still subsist, though they no longer bear the names of their founders. Melh. Eccl. Hist. vol. iv. p. 553, &c. 8vo. edit. 1768.

HATTOCK, a flock of corn, containing twelve sheaves. Others make it only three sheaves laid together.

HATUMORUNGA, in Botany, a name by which some authors have called the tree whose fruit is the ben-oil, the balsam myrsipica, or giani unguentaria, and whose wood is the lignum nephriticum of the shops.

HAVELDA, in Ornithology, the name of a bird of the duck kind, common in Iceland, and known, among the natives, by this name, called by authors *avis caudata islandica*, the long tailed island-duck.

HAUBERGEITUM, in our Old Writers, the same with *hauberge*, and *haubergeon*, which all signify a coat of mail.

HAVEN, a haven, or HARBOR for ships. See *PORT*. The word is derived from the Saxon *haven*, or the German *hafen*, or the French *havre*; which all signify the same thing.

HAYER, a name given in some parts of the kingdom to

HAYERSACK, in Military Language, is a kind of bag, made of coarse grey linen, in which the soldiers carry bread and provisions on a march. They are only used in the field and in cantonments, each soldier having one.

HAUL, in Sea Language, to pull a single rope without the assistance of blocks, or other mechanical powers. See *BOWSE*.

HAUL the wind, is to direct the ship's course nearer to that point of the compass than which the wind arises. **HAUM, HALM, or HAWM,** among Farmers, denotes the stem or stalk of corn, peas, beans, &c. from the root to the ear.

HAUNCH, or HANCH, the hip, or that part of the body between the last ribs and the thigh.

The haunches consist of three bones, joined together by cartilages, which in course of time grow dry, hard, and bony; so that in adults, the three only seem to constitute one continued bone.

HAUNCHES, or hips of a horse, are those parts of the hind quarters which extend from the reins or back, to the hough or ham.

The haunches of a horse are too long, if, when standing in the stable, he limps with his hind legs farther than he ought to do; and when the top or onier of his tail is not in a perpendicular line to the top of his hocks, as it always is in horses whose haunches are of a just length.

One of the most necessary lessons in managing the great horse, is that of putting him upon his haunches; which, in other terms, is called to couple him well, or to put him well together, or make him compact.

A horse that does not bend or lower his haunches, throws himself too much upon his shoulders, and is heavy upon the bridle. To do up the haunches, is to change the leading foot in galloping.

To make a horse bend, or lower his hips, you must frequently make him go backwards, and make use of the aids of the hands, and of the calves of your legs, in giving good steps; and if that does not succeed, he must be tried upon a *calade*, or sloping ground, after the Italian fashion.

Head in and hips in. See *HEAD*.

To gallop with the haunch in. See *GALLOP*.

HAUNT, among Sportsmen, denotes the place to which game are accustomed to resort; and among *Hunters*, it signifies the walk of a deer, or the place of his ordinary passages. See *HUNTING*.

HAVRE, in Geography, &c. a French term, signifying the same with *haven* or *harbour*.

HAUGH,

HAUGH, the same with HAW.

HAURIANT, in *Heraldry*, denotes the posture of a fish when borne directly upright. See *Tab. II. Heraldry*, fig. 53.

HAUSTELLUM, in *Natural History*, a name given by some authors to a peculiar kind of shell fish, of the purpura kind, which the French have named the *BOCASSA*, and we the woodcock-shell. It is remarkable for its extremely long and slender beak. There are a very elegant echinot and spinule kind, and two or three smooth ones.

HAUSTILLA *pecina*, in *Natural History*, a term used to express that kind of amber, or, more properly speaking, those masses of amber which are obtained by dragging the bottoms of the sea near Prussia, or found on the shores, in distinction from those pieces which are found fossil in the same or other kingdoms.

The fossil amber itself very much differs, not only in degree of beauty and purity, but also in hardness; some of it being so poor, so coarse, and so brittle, as not to be worthy the name of amber; and some, that is yet somewhat better than this, breaking in the taking up.

This difference in purity, hardness, and goodness, seems wholly owing to the different proportion in which the salts are mixed with the bitumen, in the composition of the amber; and it is no wonder that the sea or *baustilla* amber is never of the same coarse kind with some of the worst that is dug, because fish is dashed in pieces by the waves, and destroyed, and only the good preserved. The *baustilla* amber is usually found in irregular masses, for the most part wholly divested of its rough coat, and often broken, so that its original shape cannot well be ascertained; but the fossil amber generally carries the marks of its origin with it, and is either found in form of large drops of a roundish or oval figure, or else in flatted cakes, formed by the narrow spaces it is found in, between the layers of the matrix, which is always a kind of foliated or flakey substance, by some mistaken for fossil wood; or the barks of trees pressed together, though, in reality, it is no other than a bituminous earth coagulated by salts and hardened by the gradual evaporation of its superfluous moisture by the sun's heat. Phil. Trans. N° 258. p. 18. See AMBER and MATRIX.

HAUTOBOY, or HOBBOY, a sort of musical instrument, of the wind kind, with a reed, by means of which it is blown or sounded.

The word is French, *haut-bois*, q. d. high wind; and is given to this instrument, because its tone is higher than that of the violin.

The *hautboy* is shaped much like the flute, only that it spreads or widens more towards the bottom. The treble is two feet long, and has ten holes, nine only of which are harmonical: the tenor goes a fifth lower, when blown, or sounded open; it has eight holes, seven of which are only harmonical. The bafe is five feet long, and has eleven holes.

HAUTIN, in *Ichthyology*, the name by which some call the fish, more usually called *saith*, and known, among the writers on fishes, by the name *FOXVANCHES*.

HAW. A small parcel of land is so called in Kent; as a *haw-hole*, or *hawn*, lying near the house, and inclosed for those uses. But Sir Edward Coke, in an ancient plea concerning Feversham in Kent, says *haws* are houses. See HAGA.

HAW, HAWCH, or HOWCH, is used, in the North of England, for a green plot in a valley.

HAW, among *Farriers*, &c. an excellence resembling a gristle growing between the nether eyelid and the eye of a horse, or other beast, and which will put the eye quite out, if not timely taken away.

It comes by gross, tough, and phlegmatic humours, falling from the head, and knitting together, which in the end grow to this infirmity; the signs whereof are the watering of the eye, and involuntary opening of the nether lid.

Every common farrier can cut it out: the affected beast is to be held fast by the head, and with a strong double thread, a needle is to be put in the middle of the upper eyelid, and tied, if it be a bullock, to his horn; then taking the needle again, with a long thread, and putting it through the gristle of the haw, with a sharp knife cut the skin finely round, and so pluck out the haw. Thus done, they dress the eye, take out the blood, wash it with beer or ale, and cast in a good deal of salt; then wash it again, afterwards flossing it down with their hands, and so let him go. To cure a sheep of this malady, they drop into the eye the juice of chamomile, or crowfoot.

HAWFINCH, in *Ornithology*, an English name for the *COCCYTHUS*, called also the grosbeak, and by the Italians the *fringilla*. This bird is the *LOXIA caesia* of Linnaeus.

HAWK, *accipiter*, a bird of prey, of a bold and generous nature; whereof there are several species.

In the Linnaean system, the *haw* gives denomination to a whole order of birds, distinguished by a hooked beak projecting on both sides from the upper mandible, and comprehending four genera, viz. the VULTURE, the FALCON, the OWL, and LAMIA.

The *haw* makes the subject of a particular art, called *hawking*, or *falconry*.

Naturalists disagree about the number and division of the *haw* kind. The most common division is into long-winged and short-winged hawks.

To the long-winged, which may be also called the *falcon* tribe, belong the falcon, haggard-falcon, ger-falcon, lunner, hobby, saker, merlin, and bawler; all which are reclaimed, manned, fed, and viewed, much after the same manner. Of the short-winged species, or *goshawks* properly so called, are the *ger-hawk* and *sparrow-hawk*. The former are generally brought to the lure, and seize their prey with the foot; breaking the neck-bone with their beak, before they proceed to plume or tire it: the latter are brought to the fist, and kill their game by strength and force of wing, at random, and proceed immediately to plume them.

It is to be noted, that the female of all birds of prey is much larger, stronger, and more courageous, than the male; which is distinguished from it by some diminutive name. Those of the *falcon* and *ger-hawk*, are called *turkeys*, or *turklets*; that of the *ger-falcon*, *gerkin*; that of the merlin, *jack*; that of the hobby, *robbin*; that of the *sparrow-hawk*, *muffet*; and that of the lunner, *lanneret*.

The *haw* has different names, according to their different ages. The first year the is called a *yearling*; the second, an *entervisor*; the third, a *white hawk*; the fourth, a *hawk of the first coat*.

Add, that they have different denominations, according to the different seasons when they are taken. Those taken in the spring, are called *eyas*, or *nysses*; those which had forsaken it, and were fed in some place not far off, by the old ones, *branchers*; those which had begun to prey for themselves, *four knowers*; those which have changed their feathers once or more, *musket-hawks*; and those which lived at large, and preyed for themselves about the woods, *haggards*.

We shall here, according to our method in other cases, give the reader what relates to the several species of *haws*, referring for what is common to them all, to the article *HAWKING*.

1. Of the *falcon*, or *falcon-gentle*, her nature and qualities, with the manner of luring and reclaiming, and bringing her up to the sport, we have elsewhere spoken under the article *FALCON*. See *Tab. of Birds*, N° 3.

2. The *haggard falcon*, called also *peregrine falcon*, *post-finger*, and *traveller*, because it is no native of our island; or rather, on account of its roving, and wandering more than any other sort, is not inferior to the best of the tribe, for strength, courage, hardness, and perseverance. She is distinguished from the common falcon, as being larger, longer, armed with a longer beak and talons, a higher neck, &c. See *FALCON*. She will lie longer on the wing, and is more deliberate and advised in her swooping than the others.

The haggard falcon, when wild and unreclaimed, takes the greatest liberty of all birds, living either by land or sea; and is of such absolute power, that wherever she comes, all flying fowl stoop under her subjection; even the tiercelet, though her natural companion, dares not fly by her, or approach her residence, except in cawking time; when, for procreation-sake, she admits him in a submissive manner to come near and woo her.

When very young, she is apt to attack birds too strong for her; which she perils in, till a slow beating has brought her to a better understanding. She is an incessant pains-taker; no weather discouraging her from her game. When unreclaimed, as soon as she has seized her prey, and broken the ink or neck, she falls on the crop, and feels first on what is contained there; then on the other parts. When she has filled her gorge, she flies to some solitary place, near the water, where she sits all day, and at night takes wing to some convenient place, where she has before purposed, to perch till morning.

For the method of reclaiming, mowing, entering, &c. a *haggard falcon*, or *what sort of hawk*, with the terms of art used in respect thereof, see *HAWKING*.

3. The *ger-falcon*, or *ger-falcon*, is the largest bird of the falcon kind, coming next to the size of a vulture, and is of the greatest strength next an eagle; she is stoutly armed, and in all respects a lovely bird to the eye.

Her head and eyes are like those of the haggard; her beak great and bending, her ears large; her tail long and sharp pointed, and her train and mail much like the lanner's, having a large marble-flecked foot; and plumed black, brown, and russet. She may also be called a *post-finger*, her avian or breeding-place being in Prussia, Mucovy,

bovy, and the mountains of Norway. See **GERFALCON**. The ger-falcon is of a fierce and fiery nature, and is very hardly managed; but being once tamed, she proves an excellent hawk, scarce refusing to strike at anything. She does not naturally fly the river; but always pursues the herons, thrushes, &c. In going up to their gate, they do not hold the course, or way, which others use to do, but climb up upon the train, when they find any fowl; and, as soon as they have reached her, pluck her down, if not at the first, yet at the second or third encounter.

4. The *saker*, or *saccr*, is the third in esteem, next the falcon and ger-falcon, but difficult to be managed, being a *passenger*, or *perpetrator* hawk, whose avie has not yet been discovered; but the young are chiefly found in the islands of the Levant.

She is somewhat longer than the haggard falcon; her plumes rusty and ragged; the feet of her foot and beak like the latter; her pounces short; but train the longest of all birds of prey. See **SACR**.

She is very strong and hardy against all kinds of fowl, being a great deal more disposed to the field than the brook, and delighting to prey on great larks, as the heron, goose, &c. but for the crane she is not so free as the haggard falcon. She also excels for the lesser fowl, as partridges, partridges, &c. and is much less dainty in her diet, as long-winged hawks usually are.

The saker makes excellent sport with the kite, which as soon as he sees the saker call off, immediately betakes himself to, and tucks in the cooler of his wings, and gets to his pitch, as high as possibly he can, by making many turns and wrenches in the air; which, together with the variety of conceits and lacerations between them, affords a curious spectacle.

5. The *lanner* or *lannet*, is a hawk common in most countries, especially in France; making her avie on lofty trees in forests, or on high cliffs near the sea-side. See **LANNARIUS**.

She is less than the falcon-gentle, fair-plumed, and of shorter train than any other falcon. Such as have the largest and best fashioned heads, are esteemed the best. Mewed lanners are not easily known from *ger-hawks*, or *sakers*; the chief marks and characteristics are, that they are blacker, have less beaks, and are less armed and pounced than any other hawks.

Of the whole hawk tribe, there is none so fit for a young falconer as this, because she is not inclined to furtiveness, and seldom melts greasy by being over-brown.

There is another sort of *lanner*, whose avie is in the Alps, having their heads white, and flat aloft, large and black eyes, slender nates, short and thick beaks, being less than the haggard and falcon-gentle, though there are different sizes of them; their tail is marble, or russet; their breast feathers white and full of russet spots, and the points and extremities of their feathers full of white drops; their tails and trains long; they are more legged, with a foot less than that of a falcon, and marble-colored. This hawk never lies upon the wing, after she has flown to a mark; but after once flooring, makes a point, and, like the *ger-hawk*, waits the fowl. She is more valued abroad than in England; here she is considered as foolish and hard-headed. The truth is, a very strict hand must be kept over her, as being of an ungovernable disposition. She is flown at field or brook, and will maintain long fights; by which means much fowl is killed. To fly them, they must be kept very sharp; and because they have their castings long, they must have hard castings, made of tow, and knots of hemp.

6. The *merlin* is the smallest of all birds of prey, and bears a resemblance to a haggard falcon in plumage, as also in the fear of the foot, beak, and talons; and is not unlike her in conditions. See **MERLIN**.

When well manded, lured, and carefully looked after, she proves an excellent hawk, especially at partridge, thrush, and lark; but she is very bulky and unruly, and special care must be had, lest the unsuitably eat off her own feet and talons, as she has been often known to do. She is very bold; and will fly at birds bigger than herself with such eagerness, as to pursue them even into a town or village. Though the merlin be accounted a hawk of the fill, she may be brought to take delight in the lure: when you have made her come to the lure, so that she will patiently endure to hood, you should make her a train with a partridge; if the foot and kill it, reward her well: then fly her at the wild partridge; and if she take or make it at first or second flight, being retrieved by the spangle, feed her upon it with a reasonable gorge, clearing her in such a manner with the voice, that she may know it another time: if she do not prove hardy at the first or second time, she will always be good for nothing.

7. The *hobby* is a sort of hawk that naturally preys on doves, larks, and other small game. See **HOBAY**, and **TAT. II. Birds**, N° 21.

She has a blue beak, but the feet thereof and legs are yellow; the eyelids, or little feathers under the eye, very black; the top of the head between black and yellow.

She has also two white bands on her neck; the plumes under the gorge, and about the breast, are reddish, without spot or drop; the breast feathers, for the most part, are brown, yet interpersed with white spots; her back, train, and wings, are black aloft, having no great scales upon the legs, unless a few behind: the three stretchers and pouncers are very large, with respect to her short legs; her breast-feathers are tinged between red and black; the pendant ones, or those behind the thigh, of a rusty smoky hue.

She is a hawk of the lure, and not of the fill; and is a high flyer, being in every respect like the saker, but that she is of a much less size; for she is not only nimble and light of wing, but darts encounter kites, buzzards, or crows, and will give chase for fowls, and blow for blow, till sometimes they cease, and come tumbling down to the ground together. But she is chiefly for the lark, which poor little creature does to dread the sight of her, soaring in the air over her, that she will rather choose to commit herself to the mercy of them or dogs, or to be trampled on by horses, than venture into the element, when she sees her mortal enemy there.

The hobby also makes excellent sport with nets and spangles; for when the dogs range the field, in spring the fowl, and the hobby flies aloft over them, the poor birds apprehensive of a conspiracy between the hawks and dogs to their utter ruin, dare not commit themselves to their wings, but think it safer to lie close on the ground, and so are taken in the nets. This sport is called *daring*.

8. The *ger-hawk*, or *ger-hawk*, q. d. *ger-hawk*, is a large short-winged hawk, of which there are several sorts, differing in goodness, force, and hardiness, according to the diversity of their choice in cawking; at which time the several sorts of birds of prey affable themselves with the *ger-hawk*, and gallant it together. See **GO-HAWK**.

There are *ger-hawks* from most countries, but none better than those bred in the north of Ireland. This hawk ought to have a small head, a long and straight face, a large throat, great eyes deep set; the apple of the eye black; nates, ears, back, and feet, large and black; a black long beak, long neck, big breast, hard flesh, long fleshy thighs, the bone of the leg and knee short, long large pounces and talons; and to grow round from the stern, or brain, to the breast forward. The feathers of the thighs, towards the train, should be large, and the train-feathers short and soft, somewhat tending to an iron nail.

The breast-feathers ought to be like those of the breast; and the covert-feathers of the train spotted, and full of black rindles; but the extremity of every train-feather black-headed.

To distinguish the strength of this bird, she divers of them in several places of one chamber, or mew; and that *hawk* that slices and snipes highest and farthest off, may be concluded to be the strongest.

The *ger-hawk* flies at the pheasant, mallard, wild goose, hare, and coney; nay, the wild venture to seize a kid, or goat. She is to be kept with care, as being very choice and dainty in eating, &c.

9. *Sparrow hawk*, *fringillarius accipiter*, or *sala vici* of Linnaeus, is also a kind of short-winged hawk, whereof there are several sorts, different in plumage; some small-plumed and black; others of a larger feather; some plumed like a quail; some brown, or of a canvas-mill, &c. In some, the back, head, coverts of the wing and tail, are of a deep bluish grey; in others of a deep brown, edged with a rusty red; the quill feathers are dusky, barred with black on their exterior webs, and spotted with white on the lower part of their inner webs: the tail is of a deep ash-colour, marked with fine broad black bars, the tip being white; the breast and belly are of a whitish yellow, adorned with transverse waved bars; in some of a deep brown colour, in others orange; the cere, irides, and legs, yellow. The colours of the female differ from those of the male: the head is of a deep brown; the back and coverts of the wings are dusky, mixed with dove-colour; the coverts of the tail are of a brighter dove-colour; the waved lines that cross the breast are more numerous than those on that of the male; and the breast itself is of a pure white. This is the most pernicious hawk which we have; and makes great havoc among pigeons as well as partridges. It builds in hollow trees, in old nests of crows, large ruins, and high rocks; lays four white eggs, encircled near the blunter end with red specks. Pendant.

The *sparrow-hawk*, so far as her strength will give her leave, is a good hawk; and he that knows how to manage, reclaim, and fly with a *sparrow-hawk*, may easily attain to the keeping and managing of all others. In this respect she really excels, that she serves both for winter or

for summer, with great pleasure, and will fly at all kinds of game, more than the falcon.

The English legislature has thought these birds worthy of its protection: taking their eggs out of any man's ground, is punishable by imprisonment for a year and day, and by a fine at the king's will, one half to him, and half to the owner of the ground. Stat. 41 Hen. VII. cap. 17. Seizing *hunts*, in disobedience to the rules prescribed by the stat. 33 Edw. III. cap. 19. is felony. See FALCONRY.

HAN, *mare*, in *Falcons*, a name given to an old French hawk, which being wiled to fly, will teach a young one to do.

HAW, *cardi*, *heracium*, in *Botany*, a genus of the *symplocos polygama aquatica* class. Its characters are these: it has a flower composed of many hermaphrodite flowers, included in one common leafy empanciment; the flowers are equal and uniform; they have one petal, shaped like a tongue, indicated in five parts at the point; and have each five short, hairy filamina; at the bottom of the petal is situated a germ, which becomes a short four-cornered seed, crowned with down, sitting in the empanciment. There is a great number of the species of this plant, which grow naturally as weeds in England. Miller therefore only selects seven, which he esteems worth cultivating.

HAWK, *cardi*, *heracium*, in *Botany*, a genus of the *symplocos polygama aquatica* class. Its characters are these: it has a flower composed of many hermaphrodite flowers, which are included in a double empanciment; the flowers are of one leaf, uniform, tongue-shaped, and are indicated at the top in five parts, having each five short, hairy filamina; the germ is situated in the centre of the flowers, which afterward becomes an oblong seed, crowned with a long feathery down, which sits upon little foot-stalks. There are four species, which Miller selects out of numbers which he says grow as weeds in divers parts of Europe.

HAWKERS, anciently were fraudulent persons, who went from place to place, buying and selling brass, pewter, and other merchandises, which ought to be entered in open market. In this sense the word is mentioned, anno 25 Hen. VIII. cap. 6. and 33 Geo. II. cap. 4.

The appellation *hawkers* seems to have arisen from their ancient wandring, like those who, with *hawk*, seek their game where they can find it.

The term is now used as synonymous with *pedlars*; a person who travels about the country selling wares.

Every pedlar must take out an annual licence, for which he must pay 4s. and if he travels with a horse, 2s. or more, for every one of them &c. If he travels without a licence, or contrary to it, he forfeits for every offence to the informer, and the poor of the parish where discovered, 10s. If he travels with a forged licence, he forfeits 50s.

The acts relating to *hawkers* do not extend to makers of goods, or their agents; or to those who sell goods in fairs or markets; to the sellers of fish, fruit, or other victuals; nor to the vendors of books and newspapers. 1 Geo. IV. cap. 27. 3 and 4 Anne, cap. 4. Stat. 1 Geo. IV. cap. 27. by virtue of such licence, fell or offer to sell any wares, or trifling wares, though with a permit, under the penalty of having the same seized, and imprisonment and prosecution of the offender. 9 Geo. II. cap. 35. And if any foreign cambric or French lawn shall be found in the possession of any pedlar, &c. the same shall be forfeited, together with all the goods in his pack; and he shall be adjudged to have forfeited his licence. 7 Geo. III. cap. 43.

HAWKERS is a term also applied to those who go up and down London streets, and country towns, selling newspapers, pamphlets, &c.

HAWKING, the art of exercise or chasing and taking wild fowl, by means of hawks, or birds of prey.

Hawking is the same thing with what we otherwise call *falconry*.

The word *hawk*, in its latitude, also includes the training and disciplining of hawks, and fitting them for the sport.

Hawking, though an exercise now much disused among us, in comparison of what it anciently was, does yet furnish a great variety of significant terms, which still obtain in our language. Thus, the parts of a hawk have their proper names. The legs from the thigh to the foot, are called *arms*; the foot, the *prey-foot*; the claws, the *talons*. The wings are called the *feathers*; the long feathers thereof, the *barbs*; the two longest, the *primary feathers*; the next thereto, the *quills*. The tail is called the *train*; the breast-feathers, the *mauls*; those behind the thigh, the *pendant feathers*. When the feathers are not yet full grown, they are said to be *unplumed*; when they are complete, they are *plumed*. The claw, or

crop, is called the *gape*. The pipe next the fundament, where the faeces are drawn down, is called the *post*; the slimy substance lying in the canal, is called the *gleet*. The upper and crooked part of the bill is called the *hook*; the middle part, the *claw*; the yellow part between the beak and the eyes, the *iris*, or *iris*; the two small holes therein, the *nostrils*.

As to her furniture: the feathers, with bells buttoned on her legs, are called *spurs*. The leathern thong, whereby the falconer holds the hawk, is called the *hemp*; the little straps, by which the hawk is fastened to the legs, *galls*; and a line or packthread fastened to the beak, in disciplining her, a *cravat*. A cover for her head, to keep her in the dark, is called a *hood*; a large wide hood, open behind, to be worn at first, is called a *rafter hood*; to draw the strings, that the hood may be in readiness to be pulled off, is called *unruffling the hood*. The binding a hawk just taken, by running a thread through her eye-ids, and thus drawing them over the eyes, to prepare her for being hooded, is called *sewing*. A figure, or resemblance of a fowl, made of leather and feathers, is called a *bird*. Her resting place, when off the falconer's fist, is called the *perch*. The place where her meat is laid, is called the *beck*; and that wherein she is fed, while her feathers fall and come again, the *nest*.

Something given to a hawk, to cleanse and purge her gorge, is called *casting*. Small feathers given her to make her cast, are called *plumage*. Gravel given her to help to bring down her stomach, is called a *rasp*. Her throwing up fish from the gorge after casting, is called *plucking*. The purging of her grate, &c. *insanation*. A being stuffed is called *gargling*. The inserting a feather in her wing, in lieu of a broken one, is called *imping*. The giving her a leg, wing, or pinion of a fowl to pull at, is called *trim*. The neck of a bird the hawk preys on, is called the *tail*. What the hawk leaves of her prey, is called the *pill*, or *prey*.

There are also proper terms for her several actions. When she flutters with her wings, as if striving to get away, either from perch or fist, she is said to *beat*. When, standing too near, the fighting with each other, is called *realizing*. When the young ones quiver, and shake their wings in obedience to the elder, it is called *imping*. When she wipes her beak after feeding, she is said to *fast*. When she sleeps, she is said to *rest*. From the time of exchanging her coat, till the turn white again, is called her *intermoult*. Treading is called *carrying*. When she stretches one of her wings after her legs, and then the other, it is called *manoeuvring*. Her dunt is called *muting*; when the mates a good way from her, she is said to *fly*; and when she does it directly down, instead of jerking backwards, she is said to *plunge*; and if it be in drops, it is called *drizzling*. When she, as it were, sneezes, it is called *saluting*. When she raises and shakes her tail, she is said to *raise*. When, after manhandling, she crosses her wings together over her back, she is said to *twirl*.

When a hawk seizes, she is said to *bid*. When, after seizing, she pulls off the feathers, she is said to *plume*. When she raises a fowl aloft, and at length descends with it to the ground, it is called *trailing*. When, being aloft, she descends to strike her prey, it is called *striking*. When she flies out too far from the game, she is said to *raise*. When, forsaking her proper game, she flies at plover, crows, &c. that chance to cross her, it is called a *choke*. When, missing the fowl, she betakes herself to the next check, she is said to *fly in hand*. The fowl or game she flies at is called the *quarry*. The dead body of a fowl, killed by the hawk, is called a *prey*. When she flies away with the quarry, she is said to *carry*. When, in flying, she turns two or three times on the wing, to recover herself before she seizes, it is called *circulating*. When she hits the prey, yet does not strike it, it is called *raff*. The making a hawk tame and gentle, is called *reclaiming*. The bringing her to endure company, *managing*. An old staunch hawk, used to fly and set example to a young one, is called a *mate hawk*.

The reclaiming, managing, and bringing up a hawk to the sports, are not easily brought to any precise set of rules. They consist in a number of little practices and observances, calculated to familiarize the falconer to his bird, to procure the love thereof, &c. The principal hold and foundation which the falconer has to work upon, is the bird's stomach. This great principle of appetite he is to make use of a hundred ways, to lead the bird obliquely to what he would have from her: all he can do is, to divert nature, and make her subservient to his purposes, to make it the interest of the bird, either real or apparent, to do what the falconer requires of her. The course, it is evident, will be different, according to the state and condition of the bird to be managed. An *essay*, e.g. needs

no reclaiming; she is to be carefully nursed and brought up in her natural tameness.

A *hewer*, *four-hand*, or *rammer-hewer*, needs no nursing; she is to be brought down from her wildness, and habituated to another course of life; and in pursuance of her own views and interests, she is to be made subject to those of her master.

To reclaim, e. g. a *burgard falcon*, they begin with shutting her up from the light, by pulling a hood over her eyes; and fixing her by a *crane*, which makes her more accessible.

The next thing is, to handle her frequently; taking her up, often stroking her, setting her on the hand, and carrying her about; unhooding, and presently hooding her again; and this for eight or nine days, without ever suffering her to sleep.

All the while she is to be kept sharp set, but to be frequently fed with a little at a time, unhooding her for the purpose; and, when unhooded, the voice is to be continually used to her, that she may learn it; and that the hearing of the voice may naturally put her in hopes of being fed. This done, she is to be invited to come from the perch to the fill, by unfastening her hood, showing her some meat, using the voice, and calling her till she come to it, and feed thereon. If she still refuse, keep her sharp set till she will do it. Proceed then to bring her in the eve, by giving her to some person to hold, and calling her with a low, well paralysed with meat on both sides, and give her a bit of use her to this for six or seven days; after which, tempt her to come gradually farther and farther off to the lure, waving it, and calling it round your head, &c. and if she come to it roundly, reward her: in three or four days more call her to your side, well paralysed as above, as far as it is possible for her to see or hear you, and let her loose from all her furniture.

The hawk thus mannered, reclaimed, and lured, you may go with her into the field, and whistle her off your fist, to see whether she will take out, or no; if she mount and fly round you in circles, as a good hawk ought to do, after two or three turns call to her with your voice, and fling out the lure about your head, and upon her swooping or coming to it, give her a chicken, or pigeon, and let her kill and feed thereon. Being thus far initiated, give her first flocks every evening, to prepare her body for callings; and then callings, to cleanse and scour her body, and make her eager. This course continue, till she have endued and muted enough to enter upon business.

If the hawk be intended for some particular sort of game, let her lure be a resemblance of that sort of game; and make a practice of frequently feeding and rewarding her thereon, or on a train of the same kind; calling her, when feeding, as if she were called to the lure. Add, that it may be proper to feed her in such sort of places as those her game is chiefly to be found in.

To enter a hawk, it may be convenient to take a well-quieted hawk, and let her sweep a low, unbroken path; this done, reward, hood, and let her; and taking the young hawk, go half a bow-shot up the wind, hoist her hood, and softly whistle her off the fist, till she have roared, or roared; then let her fly with her head into the wind, and when she is at a proper height, let go a fowl for her to swoop and seize. See *Falcon*.

HAWK. See *HAUNT*.

HAWSE, or *HAUSE*, denotes the situation of the cable before the ship's mast, when she is moored with two anchors out from forward; viz. one on the starboard, and the other on the larboard bow. *Haule* denotes also any small distance ahead of a ship, or between her head and the anchors employed to ride her.

HAWSER, or *HAUSER*, belonging to a ship, is a rope consisting of three strands; being a kind of little cable, serving for many uses on board; as to fasten the main and fore-throwls, to warp a ship over a bar, &c.

HAWSES, or *HAWSE-HOLE*, in a ship, are two round holes under her head, through which the CABLES pass when she lies at anchor. See *Tab. Ship* fig. 2. n. 10.

HAWSE, *burning in the*, is when the cable endures an extraordinary fire.

HAWSE, *full*, is when the holes are high above the water, *HAWSE,* *flowing in*, is untwisting of two cables, which being let out at different heights, are entangled or twisted about one another. Or, directing the cables to their anchors, without lying against the stern.

HAWSE, *full*, implies that the cables lie across the stern, or bear upon each other, so as to be rubbed or chafed by the motion of the vessel.

HAWSE, *full*, or *to ride HAWSE,* full, &c. See *RIDE*.

HAWSE, *fresh in*. When there is reason to suspect the cable may be fished in those holes, they veer out a little, to let another part endure the strain. This they call to *fresh the hawse*.

Fishing the hawse is also used when new pieces are laid upon the cable in the *hawse*.

HAWSE, *riding upon the*, is when any weighty substance lies across, or falls directly before the *hawse*.

HAWSE-PICES, denote the foremast timbers of a ship, whose lower ends rest upon the knuckle-timber, or the foremost of the mast-timbers. They are generally parallel to the stem, having their upper ends sometimes terminated by the lower part of the beam-head; and otherwise, by the top of the bow, particularly in small ships and merchantmen.

HAWTHORN, in *Botany*. See *MEDLAR*.

HAY, in *Agriculture*, is a general name for any kind of grass, cut and dried for the food of cattle.

Wherever uplands are designed to be mowed for hay, are to be that up in the beginning of February, and no cattle suffered to come upon them afterwards; but the meadows and marsh-lands, where the grass grows quicker, need not be shut up till April, except the spring be bad; and many farmers feed those meadows which are in danger of overgrowing, till the first of May, and then shut them up for mowing.

In spring, the flowers, sticks, and all other kinds of foulness that lie upon the land, are to be picked up, and the mole-hills all levelled and spread, because they hinder the mowers. If the meadow lie uneven, or if they have been trodden down in winter, they should be rolled all over with a large wooden roller, the mowers will then be able to cut much closer; for this, and the quantity of the hay, will very well answer the trouble.

The time of mowing the grass must be proportioned to its ripeness; nothing can be more prejudicial to the crop, than the cutting it too soon, because the sap is not then fully come out of the roots, and such grass when dried into hay, shrinks up almost into nothing. It is very wrong also to let it stand too long; for when the feed has been ripened, and is shed, the moisture of the sap all dries away out of the stalks, and they become no better than so much stubble, as is plainly seen by those grasses which grow in hedges, and not being mowed, die away after they have perfected their feed, and become tiffless, and very different from hay. The middle or latter end of June is the general season for mowing; and the red flowers of the honey-suckle beginning to wither, generally give the farmers notice that the time is coming on. But he may be more assured of this, by the tops or heads of the grass looking full, bending downwards, and looking brown; it is then in the proper state to be cut down. If there is great plenty of the hay, and it be thick in the fourth, the hay-makers should follow the mowers, and turn the swathes as they cut them, unless there seems danger of wet weather; but in that case it is better to let them lie in the fourth. At night it must be made up into little cocks, and these in the morning must be spread again and turned, so that the other side may wither. After this it is to be made into small cocks again, and the next day it is to be spread again, and drawn into long rows, which they call wind-rows. From thence it is to be made up into large cocks after a little drying; and these large ones, if any wet comes, are to be spread open once again before they are carted in.

Mowing of land too often, and continuing it too long, are a very great prejudice to it, unless it have the advantage of being fed and renewed by land floods at times. The former who has not this advantage to his lands, should feed them once in two or three years, instead of mowing hay from them, unless he chooses to lay on manure constantly to keep them in heart. Feeding the hay-lands is the same sort of respite that following is to corn-lands, both very necessary and advantageous. See *LUCKEN*, *SAINT-ETIENNE*, and *TRAVOIL*.

Mr. Boyle tells us, that by surrounding glasses with refuse hay, well pressed and uniformly wetted, it would for several days afford such a heat, as rendered that of horridous effects. Works abt. vol. i. p. 72.

It is well known that hay laid up in wet stacks, often takes fire. Hence the custom of the ancients to place their hay-stacks, or *stables*, out of their villages.

Infusions of hay, or any other vegetable production in water, will, after some days, yield a fort of whitish scum or motherlode, which will appear on the surface, and when examined by the microscope, will be found to contain an inexpressible number of minute living creatures, or *ZOOPLANKTON*, of various sizes, forms, and kinds.

Many of these are the same with some of the animals in pepper-water; for there are some which are found indifferently in all watery fluids exposed to the air. The most common sort are oval, some hat resembling an ant's egg in shape. These run to and fro with great velocity, and they will occasionally flap, and turn several times with surprising swiftness round their own axis. This kind of motion is owing to a number of legs or fins with which they are furnished, placed in a circular order, and the

same motion is observed in many other animalcules. There is another kind very like the former, except that they have one end considerably sharper than the other; and they always move with the sharp end foremost; they are mostly transparent, but ribbed longitudinally like a melon; others are only transparent at their smaller end; these have no legs nor fins. Another sort are also found in these infusions, which are nearly as long as those of the largest live in pepper-water; they are very nimble, and have a power of contracting and extending themselves as they swim along. These have several feet, visible at the end, which seems to be the fore-part, which are most distinguishable as the water dries up, and the body of the animal shrinks into a globular form. There is another species of these animals, whose bodies are spheroidal, but pointed like a pear, and resembling bladders filled with water, in which a great number of dark particles are observed in continual agitation. The motion of these animals is chiefly a revolving one, which they perform a hundred times in a minute, first one way, and then the contrary, without moving a hair's breadth out of their place; but they are able also, when they please, to move backwards and forwards very nimbly. Animalcules in the shape of ticks are often met with in these infusions, and in many other liquors; their face is extremely different, from that of being an hundred times larger than others. Baker's Misc. 1744. p. 77, &c.

HAY-MARKET. Carts of hay which stand to be sold in the hay-market, are to pay 3d. per load towards paving and repairing the street; and shall not stand loaded with hay after three o'clock in the afternoon, &c. on pain of forfeiting 5s. Hay sold in London, &c. between the first of June and the last of August, being new hay, is to weigh fifty pounds a truss; and old hay, during the remainder of the year, fifty-five pounds, under the penalty of 2s. 6d. for every truss offered to sale. 2 W. & M. cap. 6. 8 & 9 W. cap. 4. 31 Geo. II. cap. 40.

HAY-WORM. Beside the small worms or animalcules bred in water, in which hay has been infused, which are only the objects of microscopical observation, we find that it is a proper nidus of itself, sometimes, for a much larger species of insect called the *hay-worm*, whose origin and changes have not, as yet however, been properly observed. An animal which can be produced from the eggs, and grow to its full size during the short time that hay is left in the field in making, must be very quick in its growth; but yet it is found that multitudes of such are produced, though probably few come to perfection, the removing of the hay naturally destroying many. In the Philosophical Transactions we have an account of the same sort of insect breeding among cocks of barley while left in the field, many millions of them being discovered together on stirring or lifting up the cocks with a cane. They are also found in the barns where barley is laid up, and are so numerous that they strew the way the carts go that carry the barley home by the multitudes that are shook off. They are about half an inch long, as thick as a pigeon's feather, and of a whitish colour shaded with faint stripes of a yellowish brown. They have fourteen feet, and seem evidently by all their marks to be true caterpillars. They are of an offensive smell; and their excrements are hard white pellets of pure flour, like that of barley; whence it is plain that they eat the grain.

HAY. *Barpagnum*, in Botany. See *SWARTZ*.

HAY, HAY, or HAYE, a fence or inclosure, formed of rails; wherewith some forests, parks, &c. were anciently surrounded.

HAY is sometimes also used for the park itself; and sometimes for a hedge, or a place hedged round.

HAYS also denote a particular kind of nets, for the taking of rabbits, hares, &c.

HAYBOTE, HEDGEBOTE, in our Ancient Customs, a mulct, or recompence, for hedge-breaking; or rather, a right to take wood necessary for making hedges either by a tenant for life, or for years, though not expressed in the grant or lease.

It is mentioned in the Monast. tom. II. pag. 134. *Et vinetis eis, ut de haye sua heybote, &c.* In the same place, *heybote* signifies a right to take timber to repair the house. See *BOTE*.

HAYWARD, or HAWARD, a keeper of the common herd of cattle of a town; who is to look that they neither break nor crop the hedges of inclosed grounds; and is sworn in the lord's court for the due performance of his office. See *AGILLARIES*.

HAZARD, a game on dice, without tables, is very properly so called, since it speedily makes a man, or undoes him.

It is played with only two dice; and as many may play at it as can stand round the largest round table. Two things are chiefly to be observed, viz. main and chance; the latter belonging to the caller, and the for-

mer, or main, to the other gamblers. There can be no main thrown above nine, nor under five; so that five, six, seven, eight, and nine, are the only mains flung at hazard. Chances and nicks are from four to ten: thus four is a chance to nine, five to eight, six to seven, seven to six, eight to five, and nine and ten a chance to five, six, seven, and eight; in short, four, five, six, seven, eight, nine, and ten, are chances to any main, if any of these nicks it not. Now nicks are either when the chance is the same with the main, as five and five, or the like; or six and twelve, seven and eleven, eight and twelve. Here observe, that twelve is out to nine, seven, and five; eleven is out to nine, eight, six, and five; and aces-ace and duces-ace, are out to all mains whatever.

Due to illustrate this game by a few examples: suppose the main to be seven, and the caller throws five, which is his chance; he then throws again, and if five turn up, he wins all the money he laid; but if seven is thrown, he must pay as much money as there is on the board; again, if seven be the main, and the caller throws eleven, or a nick, he sweeps away all the money on the table; but if he throws a chance, as in the first case, he must throw again; lastly, if seven be the main, and the caller throws aces-ace, duces-ace, or twelve, he is out; but if he throws from four to ten, he hath a chance; though they are accounted the worst chances on the dice, as seven is reputed the best and easiest main to be flung. Four and five are bad throws (the former of which being called by the tribe of nickers, little dick-fishes) as having only two chances, viz. *treys-ace* and two *duces*, or *treys-duce* and *quater-ace*; whereas seven hath three chances, viz. *cimpr-duce*, *six-ace*, and *quater-ace*. Nine and ten are in the like condition with four and five; having only two chances. Six and eight have indeed the same number of chances with seven, viz. three; but experienced gamblers nevertheless prefer the seven, on account of the difficulty to throw the doublets, two quaters, or two treys. It is also the opinion of most, that at the first throw the caller hath the worst of it. On the whole, hazard is certainly one of the most bewitching and ruinous games played on the dice. Happy, therefore, the man who either never heard of it, or who has resolution enough to leave it off in time. See *De Moivre's Doct. of Chances*, p. 160, &c. See *CHANCE*, and *GAMING*.

HAZLE, or NUT-TREE, Corylus, in Botany, a genus of the *monocotyledon* class. Its characters are these: it hath male and female flowers growing at remote distances on the same tree; the male flowers are produced in long scaly catkins, having no petals, but eight short stamens fastened to the side of the scale; the female flowers are included in the future bud, sitting close to the branches, having a thick two-leaved perianthium; there have no petals, but a small round germin occupies the centre, which afterward becomes an oval nut, thaved at the base, and compressed at the top, ending in a point. Miller enumerates three species; the wild *hazel-nut*, the *STANERT*, and the *Byzantine nut*.

All these sorts may be propagated by layers, or by sowing their nuts in February; which, in order to preserve them good, should be kept in sand in a moist cellar, where the vermin cannot come to destroy them; nor should the external air be excluded from them, which would occasion their growing mouldy. Miller.

No great use is made of the nut-tree in medicine; some account the juil and nut shells to be refrigerant or binding; the kernels are hard of digestion, and stuffing, causing shortness of breath and wheezing; yet an emulsion made of them with mead, is commended for an old dry cough.

Fibers are more nourishing than nuts, and are by some esteemed pectoral. The moderate use of them agrees at all times with every age and constitution, provided there be a good stomach. James.

Nuts and fibers will purge when taken in considerable quantities. The cream of these nuts is good for the stone, and heat of urine; emulsions may be made of them. Quercetan gave a dram of the powder of nut-shells, mixed with an equal quantity of prepared coral, in a glass of the water of cardus benedictus, or corn-poppay, in the plenty.

HAZLE-EBB, in Agriculture, a moderately compact earth, much approaching to the nature of the chalky soil, and indeed properly a species of it, but always containing a large quantity of rein-coloured sand.

HAZLE-BIRD, in Ornithology, the name of bird of the *galinaceous* kind, common in the woods of Germany, and supposed by many to be the *ATTAGEN* of the ancients. It is of the size of a very small pullet; its belly is all over perfectly white; its breast white variegated with black; its throat is reddish, and under the beak black, in the male, but in the female, of the same color with the rest.

rest; it has on each side of the head a white line; its head is of a greyish brown, and its back and rump much of the same colour with the partridge; its sides are of a yellowish or reddish brown, variegated with white; its wings are variegated with black, brown, and white, and is also the tail, but that has an admixture of red. It is caught in thick woods, and feeds on vegetables. Ray's Ornithology, p. 126.

HAZEL, *witch*, in Botany, *hamamelis*, a genus of the *tetrاندريا digitata* class. Its characters are these: it is male and female in different plants; the male flowers have a four-leaved caliculus, four narrow petals which are reflexed, and four narrow stamens which are shorter than the petals; the female flowers have a four-leaved involucre, in which are four flowers, with a four-leaved coloured caliculus; they have four narrow petals, and four stamens adhering to the petals; in the centre is situated an oval hairy germ, which afterward becomes an oval capsule sitting in the involucre, having two cells, each containing one hard, oblong, smooth seed. We have but one species of this plant, a native of North America, which is rather preferred in gardens for variety than for beauty.

HEAD, *caput*, the uppermost or foremost part of the body of an animal.

Pliny, and other of the ancient naturalists, speak of a nation of people without heads, called *Brasavens*. We have accounts, in modern geographers and travellers, of people whose heads are as flat as the hand; it being the custom among them to flatten the children's heads, when newborn, by passing them through a press, or laying them between two planks with a considerable weight thereon. These are said to be the inhabitants of the province of Coquima, on the river Amazons, in South America.

Anatomists account the head of man the first or uppermost venter; being that which comes last in order of dissection, because its contents are not so subject to corruption as those of the others.

The head is divided into two parts: the first, the *calvaria* or scalp, being that part covered with hair.

The second, smooth, or without hair, called the *face* or *visage*; by the Latins, *facies*; and by the Greeks, *prosopon*, q. d. looking forward.

The former is subdivided into four, viz. the *front* or forehead, which is reputed the most humid, called by physicians the *fonticulus*, q. d. *fontem lapidis*.

The hind or back-part, called *occiput*, by the Greeks, *trich*; because all the nerves, which among them are called *trich*, arise from this part.

The middle or top-part, called the *crown* of the head, and by anatomists *vertex*, a *versum*, because the hair turns round there.

Lastly, The sides are called the *temples*, *tempora*, so being the places where the hair first begins to turn grey and discover the age.

The bone or basis of the head is called by one general name, *skull* or *cranium*, consisting of several parts or lesser bones.

The bone of the forehead is called *as frontis*, or *supra*, or *coronalis*, or *supercilium*; whose impudent perions are said to be *frontalis*.

The bone of the scalp is called *as scapitis* or *bregma*.

The bone of the back of the head, *as basipitis* or *proton*.

And those of the temples, *temporalis*, or *osse temporis*.

These bones are connected or joined together by sutures.

In the head are seated the principal organs of sense, viz. the eye, ear, &c. and in it likewise the brain, invested with its meninges, the supposed seat of the soul.

The head is moved by ten pairs of muscles, viz. the *paraspasmus*, *complexus*, *rectum capitis externum*, *rectum capitis externum*, *obliquus superior*, *obliquus inferior*, *masseter*, *rectum internum majus*, *rectum internum minus*, and *rectum laterale*.

See each described under its respective article.

HEAD, cartilages of the. The condyloid apophyses of the os occipitis, the glenoid cavity, or articular fossula of the ossa temporum, the eminences next these cavities, and the condyloid apophyses of the lower jaw, are all cradled over with very white and smooth cartilages, and there is likewise an interarticular or moveable cartilage in each articulation of the lower jaw with the temporal bones. The remaining cartilages of the head are the cartilaginous septum, and other cartilages of the nose; the small cartilaginous ring in each orbit, the cartilages of the outer ear, and those which are joined to the os hyoides; which see in their proper place.

HEAD, ligaments of the. The ligaments of the bones of the head are these: those between the occipital condyles and the superior apophysis of the first vertebra of the neck; those between the os occipitis and the apophysis densiformis of the second vertebra; those of the articulation

of the lower jaw with the temporal bones; and those by which the os hyoides is connected to the styloid apophyses. To these must be added the ligaments which connect the cartilages of the ear, those of the nose, the small cartilaginous pulleys of the orbits, and the ciliary cartilages.

The ligaments of the occipital condyles resemble those of the vertebrae, and consist of a strong texture of ligamentary filaments, placed close by each other round the whole articulation, and fixed by one end in the occipital bone, by the other in the superior apophysis of the first vertebra, and surrounding the capsular ligaments.

The ligaments which go from the os occipitis to the apophysis densiformis are very thick, and disposed in separate fasciculi, which afterwards unite, and the ligaments of the articulation of the lower jaw are very strong, and disposed and inserted in such a manner as those by which the clavicle is inserted into the sternum. They are fixed, by one extremity, round the glenoid cavity, or articular fossula, and eminence of each temporal bone, by their middle, round the interarticular cartilage, and by the other extremity round each condyle of the lower jaw. Winslow's Anatomy, vol. i. p. 151.

HEAD, the diseases of the, are often mistaken, even by physicians, for those of other parts. Mr. Lientand, of the French Academy, gives an extraordinary case of this kind. A man had a fever, with a violent disorder of the head; he afterwards was seized with a violent cough, and brought up a large quantity of matter: it was not doubted but that this was from the lungs, and no one questioned but that the man had an abscess there. On opening the body, however, the lungs were found perfectly sound, and all his disorder was found to be in his head, where the sphenoidal, frontal, and maxillary sinuses were found to full of matter, that they could contain no more.

Some physicians tell us, that persons who are subject to disorders of the head, ought not to take any food at night. Dr. Bryan Robinson of the Food and Discharges of Human Bodies, p. 95.

M. Le Dran, in his Observations on Wounds of the Head, shews how much more dangerous the case is, when the cranium does not break by violent blows, &c. than when it is fractured, because of the greater commotion of the brain, &c. and therefore concludes it necessary to perform the operation of the trepan oftener than is commonly practised. Med. Ess. Editio.

M. Winslow has given us some very particular and curious remarks on the motions of the head and neck, in the Memoires de l'Acad. Royale des Sciences, an. 1730.

HEAD, ulcers of the. There are several ulcers of the hairy part of the head is subject to, and which the writers in medicine have distinguished by the several names of *timea*, *favus*, and *achores*; though they do not all agree about the determinate signification of each of these words. By the term *timea*, however, we now generally understand such ulcers of the head as are full of cavities like a honey-comb; by *achores*, those which are full of small holes, and contain a moderately viscid humour. Many call these disorders by the common name of *timea*, because, from the abundance of small holes in them, they make the head look like a moth-eaten garment; but this is a vague signification of the word, and we usually now understand it, in a more determinate sense, to mean a large and dry scab, to which the heads of children are subject, and which is full of thick foul scales, and very offensive to the smell. This sometimes also extends itself to the face, in which case it is called *crusta lactea*. It is often of a mild and benign nature, but is sometimes very ill-conditioned and dangerous. There is also a yet worse kind of *timea* than this, which covers the whole hairy scalp with an ash-coloured thick crust, attended with a violent itching and grievous flench; this is generally very difficult of cure, and the persons afflicted with it have generally a pale unhealthy countenance; it much more frequently affects young persons than adults, and is generally occasioned either by the nurse's irregular course of life, or the child's being used to *lact feeding*. Sometimes also ulcers of this kind from the same cause, break out in adults, and are very difficult to cure; these much resemble the leprosy; and in the pox it is common to find the head and face, particularly the forehead, spread with dry scabs and scabby ulcers.

When ulcers of these kinds are slight, gentle purges, with the addition of calomel, should be given at proper intervals, administering between whiles, to adults, the decoctions of the woods, with the sweetening powders. Infants at the breast may take diaphoretic powders, and their nurses ought to prosecute the other methods. Externally it is proper to use cream, with a small quantity of cerus mixed in it, or the oil of eggs or of wax, with the camphire ointment, or that of cerus or the diaphoretic.

pompholygos. And if the ulcers are of a worse kind, doses of calomel are to be given more frequently, and a little crude quicksilver may be added to the external applications with great success. But in worse cases, and where mercurials may be employed, it will be necessary to take off all the hair; this may be done either by degrees or at once, by means of a pitch plaster spread upon strong cloth, and applied all over the scalp after the hair has been cut pretty short. When a plaster of this kind has lain on twelve, or four and twenty hours, the method is to pull it off at once, and it brings away with it both all the hair and the scabs. This, though a good method, is however a very harsh one, and cannot be done without great pain and effusion of blood. When the plaster is taken off, the blood is to be wiped away with dry lint, and then the head anointed with oil of harts, and a small admixture of oil of wax, among it, and afterwards the whole scalp should be covered with a plaster of frogs spawn, with a small admixture of camphor. This dressing should be repeated every day, till the injured parts are clean, and then they may be healed with the oil of eggs and essence of amber. Internal medicines, to sweeten the blood, and a regularity of diet, should also be observed at the same time; a mixture of crude antimony and liquor of hartsbane serve well for this purpose, and should be given for some time before the external remedies, here directed, are employed.

Heiter's Surgery, p. 28.

HEAD, *anatom.* See HYDROCEPHALUS.

HEAD of fish, *caput piscium*. The head, in the fish kind, is in very various in its shape and figure, that it makes one of the great virtues of their distinction and characters. The head is always single, and placed at the anterior extremity of the body; but its proportion or size, as well as figure, is very various in the several kinds. Its differences in figure are five.

1. In some fishes, catfishes, &c.; that is, its sides seem squeezed together, and its perpendicular measure for the reason, is greater than its transverse measure. We have instances of this in the perch, the cyprin, and in several others.

2. In others it is plagiopterus; that is, depressed so that its top and bottom seem to have been squeezed downwards upon one another. Hence its horizontal breadth is greater than its perpendicular, and it is, in all respects, the contrary to the other head. The conger, the flurgeon, and the ray-fish, give us evident instances of this sort of head.

3. In some fishes the head is evidently rounded and cylindrical, as in the petromyzon.

4. The head is, in some, smooth, as in the case of most fishes; but in others it is rough and scaly, as in the scorpion, the cotti, and the legfish.

The differences with respect to proportion are also very great. The head, in respect of the rest of the body, is, in some, 1. Narrower than the middle of the body, as in the cyprin, salmon, mackerel, perch, &c. 2. In some it is broader than the middle of the body, as in the cod, fluke, &c. And, 3. In others it is about equal to the middle of the body in breadth, as in the charr.

For the differences of the mouths of fishes, see MOUTH.

The bones of the head, in all animals, deserve great attention; and in fish particularly, as they are more numerous in these than in other creatures. They differ much also in the various kinds of fish, in number, figure, and situation. As to number, 1. They are fewer than usual in the cetaceous and cartilaginous kinds. 2. In the finoid fishes, in general, they are very numerous; the bones in the head of the perca fluviatilis of Bellonius will serve as an instance of this. The number is not the same in the several kinds that seem nearest allied. In the fish last mentioned there are no less than eighty; there are five in the tongue, one oblong one in the anterior part, and four shorter in the hinder part; there are four in the lower jaw, two on each side; the odd hyophratna are ten on each side, four are small, and of different figures from the rest; the membrana branchiæ, 22. continue on each side seven of them; the outmost lamina, behind the rays, are four on each side; the upper jaw consists of four bones, two on each side; the maxilla have each one bone placed below them; the bones of the palate are four, three of these are small and stand towards the other is long and shaped like a pickaxe-head, and extended all over the palate; the middle of the anterior bone is nicely articulated with this; there is beneath this, a cartilaginous bone of a very singular figure, situated under the bones of the palate, almost to the end of the snout; this has on each side an angular bone followed to it, and under that end which is nearest the snout there is yet another placed, which is of a very singular figure.

The bones that cover the head above are four; the two anterior ones are small, the two posterior ones are long,

and so broad, that they cover the greater part of the head and cranium. The bones of the cranium are eleven in number; that which is nearest the vertebra is large, and has several apophyses and cavities; in the lower part of this there are contained two oblong and flat little bones, of almost a stony hardness; all the rest are smaller, and all of very singular and remarkable figures. — Arctii, Ichthyology.

HEAD is also applied in a general sense, by analogy, to the uppermost or principal extremity of any thing; or figuratively, when speaking of communities, to the superior, and, when referred to place or priority, is that station or position which is most honourable.

HEAD, in Architecture. Heads are used as an ornament of sculpture or carved work, frequently serving as the key of an arch or plat band, and other occasions.

These heads usually represent some of the heathen divinities, virtues, seasons, ages, &c. with their attributes. The heads of beasts are also used in places suitable thereto: as a bullock's or sheep's head, for a flambeau or a market-house; a dog's for a kennel; a deer's or goat's, for a park or forest; or a horse's, for a stable, &c.

In the statues of the frigians, and other parts of certain antique Doie temples, we meet with representations of bullocks or ram heads fixed, as a symbol of the sacrifices offered there.

In Heraldry, the heads of men, beasts, birds, &c. are borne in armour, either full-faced and in front, or three-quartered and in profile, which must be distinguished in blazoning.

Among Medallists, the different heads on ancient coins are distinguished by the different styles thereof. See MEDAL.

In the imperial medals, where the head is quite bare, it is usually a sign the person was not an emperor, but one of the children of one, or the presumptive heir of the empire.

Though we have instances of those who were only Cæsars, and never reigned, being crowned with laurel or adorned with a diadem; as on the contrary, we have some emperors heads entirely bare.

The heads which are covered, are either covered with a diadem or a crown, or a simple cap, or a veil, or with some other foreign covering; whereof the diadem is the most ancient. The senate first granted it to Julius Cæsar to wear the laurel crown, which his successors took after him.

The heads of deities are frequently distinguished by some special symbol thereof.

HEAD is also used for the horns of a deer, as a hart, buck, &c.

HARTS mew, or cast their heads, every year, and get new ones.

The old hart or buck casts his head sooner than the young; and the time is about the month of February or March. Having cast their heads, they instantly withdraw into the thickets, hiding themselves in convenient places near good water, &c. and far from the annoyance of flies.

After they have mewed, they begin to butter again in March or April, i. e. to shoot out new horns, which at first appear like little branches.

Note, if a hart be felt before he have a head, he will never bear any; and if he be felt when he has a head, he will never after mew or cast it. If only one of his antlers be taken out, it is said he will want a horn on that side; and that if one of the antlers be only tied up, he will want the horn of the opposite side.

The age of a hart or deer is usually reckoned by the number of heads. A deer of the first head, of the second head, &c.

At one year they have nothing but bunches, called signifiers, of horns to come. The second year they appear more perfectly, but straight and simple: this makes the first head, properly called branch, and, in a fallow deer, pricks. The third year they grow into two heads, or four, six, or eight small branches. At the fourth, they bear eight or ten. As the fifth, ten or twelve. At the sixth, fourteen or sixteen. At the seventh year they bear their heads branched, branched, and summed, as much as they will bear; never multiplying farther, but only growing in magnitude.

The names and diversities of heads, in the hunting language, are as follow:

The part that bears the antlers, rays, and tops, is called the beam, and the little streaks therein are called: that which is about the crust of the beam is termed points; and that which is about the bar itself, formed like little pearls, is called pearls bigger than the rest: the bar is next the head, and that which is about the buds called pearls: the first branch is called antler, the second fur-antler; all the rest which grow afterwards, till you come

come to the crown, palm, or croche, are called *regals*, or *sur-regals*; the little buds or broches, about the tops, are called *ore-lin*.

The *head* also go by several names. The first *head* is called a *crown* tip, because the croches are ranged in form of a crown, the second is called a *raised up*, because the croches are formed like a man's hand. In all *heads* which bear not above three or four, the croches being placed aloft, all of one height, in form of a cluster of nuts, are called *heads of a many croches*. All *heads* which bear two on the top, or have their croches doubling, are called *forked heads*. All *heads* which have double horns, or the antlers, rays, and croches, turned downwards contrary to the other *heads* are called *single heads*. See HUNTING.

HEAD is sometimes also used for the whole man.

In this sense we say, to take a reward for a man's head.

In professions, there is a price set on a man's head. Captain depones a tax laid upon each head, called also *poll* and *head-money*.

HEAD, in the Military Art. Head of the camp is the front or foremost part of the ground on which is encamped on, or that which advances most towards the field or enemy.

The head of the camp is always to be the best fortified. In the like sense we say, the head of the battle, the head of the sea, of the world, &c. meaning the front, or those parts next the enemy, and farthest from the body of the place. See TRENCH and ATTACK.

The head of a horn is that part contained between the flanked angles of the two demibellows.

HEAD of a ship or other vessel. In the press, or that part that goes foremost, including the bows on each side.

HEAD also denotes an ornamental figure erected on the culmination of a ship's stem, as being expressive of her name, and emblematic of war, navigation, commerce, &c. See TAB. SHIP, fig. 2. *lit. A. fig. 1. ut. I.*

HEAD, in the Manner. The perfections required to the head of a horse are, that it be small, narrow, lean, and dry. Horses with a big gross head, are apt, by their weight, to rest and toll upon the bridle, and so to inconvenience the rider's hand. A horse with a large head can never look steadily, unless he have a long and very well-tuned neck, and place his head well. Horses with gross, fat heads, much charged with flesh, are too often subject to infirmities of the eye.

But the chief thing in a horse's head is a good set, so as he may be able to bring his head into its natural situation; which is, that all the fore-part, from the brow to the nose, be perpendicular to the ground: so that if a plummet were applied thereto, it would but just raze or shave it. See HORSE.

The head of a horse is also used to import the action of his neck, and the effect of the bridle and will.

To give a horse the head, see EQUUS, &c.

HEAD in, and thereby the hips, is a phrase importing that you shall passage your horse with his head and croche in, i. e. work him side-ways upon two parallel lines, as step or trot, so that when the horse makes a step or volt, his shoulders make a *pile* or tread, at the same time that his haunches give the track of another; and the horse plying or bending his neck, turns his head a little within the volt, and so looks upon the ground he is to go over.

MALE HEAD is understood of a horse with a black head and feet, the body being usually of a roan colour. It is also used by engineers, for a kind of boom or grivade thrust out of a cannon: in Heraldry, for a representation, usually in profile, of a blacksmith's head, swathed or rolled about with a bandage; frequently borne as a crest: in Geometry, as a cover or capital of an alembic, having a long neck, to convey the vapours raised by the fire into a vessel, which serves as a refrigeratory. In Music, the head of a voice, tenor, or the like, is the place where the pins or pegs are fastened, to stretch or slacken the strings.

DRAGON'S HEAD, in Astronomy, &c. is the ascending NODE of the moon or other planet.

HEAD-ACH, in Medicine. Physicians commonly distinguish the head-ach into two kinds, according to its degree and continuance. The gentler kind, and which commonly afflicts a particular part of the head only, they call cephalalgia, and the more violent and obdurate cephalaea; when the pain is on one side only, it is called HEMICRANIA, and when it is a fixed pain in the forehead, which may be relieved by the end of the thumb, it is called the CLAVUS HYSTERICUS.

Cephalalgia is defined to be a pain in the head, proceeding from a copious concretion of the blood and humours in that part, which do not find any exit or passage from thence.

They generally distinguish it also into two kinds, the idiopathic and the symptomatic.

The idiopathic is that which arises from a plethora, and

an immediate concretion of blood or humours in the head. The symptomatic is that which arises from a fault in the primæ viæ, communicating with the head by means of the par vagum of nerves, or from a translocation of the humours in the head, in fevers or other disorders.

The distinction of the cephalalgia from the cephalaea is, that in the latter all the symptoms are more violent; the cephalaea also is usually chronic and habitual; the cephalalgia only recurs at times, and has but short periods. The simple cephalalgia is also distinguished from the venereal head-ach by the burning heat and sensation of erosion which attends the latter, which also is continual, or, at least, never wholly ceases, and is always most violent in the night, when the body is at rest, and is hotter than in the day.

The cephalalgia sometimes seizes on the whole head, but more usually the forehead is the seat of it; very frequently also it is felt about the origin of the nose, and a weight or pressure and burning heat are felt in the os cribrosum, and often at the same time there is felt a violent weight and pressure in the bulbe of the eye; not unfrequently a tooth-ach attends upon the cephalalgia, and when this is violent, the other aches in proportion. A noise and ringing in the ears are often also attendant on it, and the eyes are often red and inflamed; the face also looks red, and often turgid, but sometimes it looks as remarkably pale, or has a redness irregularly spread over it; both these cases are from strictures upon the vessels. The vessels of the neck and temples are often turgid. Women are very subject to this pain about the time of their menstrual discharges, either before their eruption, or at any time on their diminution; sometimes the head-ach is attended with a vertigo, which gives proof of a very violent concretion, and sometimes a binding of the bowels, and a slight suppression of urine attends it.

People of a plethoric habit of body are more subject than others to this pain, and, in general, young people more than such as are older, and women more than men; and persons who live high, and drink much wine, and use little exercise, suffer much more by it than those who live lower, and use much labour and exercise. When the head-ach proceeds from a hot bilious habit, the pain is very acute and throbbing, with a considerable heat of the part affected. When it proceeds from a cold phlegmatic habit, the patient complains of a dull heavy pain, and has a sense of coldness in the part: this kind is sometimes attended with a degree of stupidity and folly.

HEAD-ACH, causes of. Among the natural and internal causes, the principal are too great a quantity of blood, and a derivation of great quantities of it toward the head, with an intention of nature to relieve herself there by a hemorrhage from the nose. The external or accidental means that may bring on this pain are very numerous: the natural and habitual evacuations of blood being suppressed, and of these particularly a bleeding at the nose, the neglect of accustomed bleedings, sweat prevented or repelled, and the omission of purging customary before at certain periods of the year; great commotions of the body, or passions of the mind, especially anger, drunkenness with spirituous liquors of any kind, the attracting ærid fumes through the nose, a sudden cooling of the legs or feet, hanging down the head, looking long obliquely at any object, wearing any thing tight about the neck, a translocation of the peccant matter toward the head in fevers, and a peculiar sensibility in the organs of smelling, whence perfumes give some persons the head-ach; and to all these are to be added an hereditary disposition, or injuries from blows or concussions of the head long before.

Sometimes the head-ach proceeds from the repulsion or retrocession of the gout, the erysipelas, the small-pox, measles, itch, or other eruptive diseases. Principles from it. The head-ach is a pain rather troublesome than dangerous in itself; but it too easily degenerates into worse complaints, and not unfrequently prefaces defects of the sight or hearing, or the gout; and in old age, lethargies, apoplexies, and paralytic disorders. The head-ach often is cured by nature, by plentiful hemorrhages from the nose, and sometimes by inflammatory disorders of the adjacent parts: it more easily leaves young people than old; and, indeed, where long settled upon a person, and become habitual, rarely gives way to any remedies. The head-ach often is symptomatic in continual and intermitting fevers, especially quartans: it is likewise a very common symptom in hysterical and hypochondriac complaints. When the head-ach attends an acute fever, with pale urine, it is an unfavorable symptom.

Modes of cure. The congestions of humours are to be derived from the superior to the inferior parts, and, above

all things, the bowels are to be loosened by clysters and purges, for they are usually bound up in this disorder. After this, medicines are to be given which will quiet the violent emotions of the blood; such are powders of nitre, crab-eyes, and some diaphoretics, with a little cinnamon, according to Stahl. When the blood is thick, a scruple of tartarum vitriolatum may be given every day with great success. After these, the gentle diaphoretics are to be given in small doses, with the diluent decoctions of the common tea-herbs, such as balm, sage, and the like. And if the pains are excessive, a gentle opiate, such as a small dose of the stork-pill, may be added to these.

When the *head-ach* is owing to excess of blood, or a hot bilious constitution, bleeding is necessary; which may be performed in the jugular vein, or by cupping, or the application of leeches to the temples or behind the ears. A blistering plaster may also be afterwards applied to the neck, behind the ears, or to any part of the head that is most affected. In some cases it will be proper to blister the whole head. In persons of gross habit, issues or perpetual blisters will be of service; and the belly should likewise be kept open by gentle laxatives. But when the *head-ach* proceeds from a copious viscidum serum stagnating in the membranes, and will not yield to bleeding or gentle laxatives, more powerful purgatives are necessary, as pills made of aloes, resin of jalap, &c. the whole head should also be blistered, and the back part of the neck kept open for a considerable time by a perpetual blister.

External applications sometimes also assist the use of internal medicines; of this kind are spirits of wine camphorated, with a small admixture of saffron; this sometimes almost instantaneously removes the pain. The affected part may be rubbed with Riste's anodyne balsam, or a cloth dipped in it may be applied to the part; and, in case of extreme pain, the patient may, at the same time, take twenty drops of laudanum, in a cup of valerian or penny-royal tea, twice or thrice a day; but the use of opiates should be always accompanied with proper evacuations. A violent *head-ach* may sometimes be removed by a little of Ward's essence dropped into the palm of the hand, and applied to the forehead; or by ether, applied in the same manner. Dr. Percival found by repeated experience, that the use of eighteen drops of laudanum and strong coffee removed the *head-ach*, without occasioning any disposition to sleep; the narcotic effects of the opium being counteracted by the coffee. Coarse bread, with juniper-berries, caraway-seeds, and salt, laid on as an epithem, is also sometimes a present help; and bags of aromatic ingredients, reduced to a gross powder, are, though a slower, yet often a very valuable relief. All these are only to be used in the idiopathic *head-ach*; for in the symptomatic, regard is to be had only to the principal disorder; and when the cause is removed, the effect always ceases. After the fit of the *head-ach* is over, it is proper, by way of prevention for the future, to bleed in the spring and autumn, and frequently to bathe the feet in warm water. The use of gentle exercise is to be greatly recommended. The fatty or oleaginous remedies, prescribed by some for rubbing on the head, are to be carefully avoided, as they stop up the pores and prevent perspiration. The smelling to pungent liquids is not of so much benefit as usually supposed. The various volatiles, such as spirit of hartshorn, oil of vitriol, and the like, are sometimes of a little present relief; and these, or any thing that will irritate the nose, may be freely used when the *head-ach* is occasioned by a stoppage of a running at the nose; but the common use of spirit of lavender and Hungary-water, on these occasions, is often the cause of more violent pain, by causing a fresh derivation of humours on the parts. Cinnamon has, by many authors, been supposed a dangerous medicine in all cases of this kind; but Stahl affirms, on repeated experience, that it has great good effects; and that in these, and many other cases, it supplies the place of opiates and anodynes. When the patient cannot bear the loss of blood, his feet should be frequently bathed in lukewarm water, and rubbed with a coarse cloth; cataplasms with mustard or horse-radish should be also applied to them, especially when the pain proceeds from a gouty humour affecting the head.

The diet of persons afflicted with the *head-ach* should consist of such emollient substances as will correct the acrimony of the humours and keep the body open, as apples boiled in milk, spinach, turnips, &c. The drink should be diluting, as barley-water, infusions of mild mucilaginous vegetables, decoctions of the sudorific woods, &c. The feet and legs should be kept warm, and often bathed in warm water, and the head shaved and washed with water and vinegar, and kept, as much as possible, in an erect posture.

Cephalaea is a violent and continual pain in the head, occasioned by a rheumatic congestion of humours in the head.

Notwithstanding the *cephalaea* is a continual and unintermitting pain of the head; yet it is subject to some remissions, and is therefore distinguished by authors into the periodic, the continual, and the vague *cephalaea*. The continual kind is that which is always in the same degree, and admits not of the least remission. The periodical is that which has its regular periods of being less intense; these are called its remissions. And finally, the vague *cephalaea* is that which has times of being less violent; but these return at no regular or stated periods.

Signs of it. The *cephalaea* sometimes so much resembles the *cephalalgia*, or common *head-ach*, that it only differs from it by its obstinate continuance and the violence of the pain; and in women it has all the same symptoms with the *clivus hystericus*, except that it affects indifferently all parts of the head. When this complaint arises from a venereal taint in the blood, it is always violent; but most so, when the person is warm in bed. When it arises from a scorbutic conglutination of the blood, or an inflammation of the meninges of the brain, the pain is remarkably sharp and piercing, and is attended with a febrile heat and an intolerable thirst. These generally comes on a vertiginous disorder of the head after this complaint has had the patient some time, and the patient can never bear any motion; and on the least shaking or disturbing the head, the pain becomes violently intense, and resembles the beating of an artery in pulsation. The pain is in general less violent while the patient lies down, but as soon as the head is raised up ever so little, it increases to a great degree. The least noise or motion is terrible to persons in this state, and the light is frequently offensive and painful; so that the patient loves retirement in darkened and quiet rooms, and avoids company. Liquors of any strength give violence to the pain as soon as drunk; and in cases of this kind, where a scorbutic habit is the cause, frequent and violent bleedings at the nose happen, which give no lasting relief, but only an abatement of the pain for the time.

Women are generally more subject to this terrible pain than men, these being rarely afflicted with it, unless when there is some violent disorder in regard to the hemorrhoids, or when there is a venereal taint in the blood. Among women, these are most subject to it who live high and lead sedentary lives, and who are of a melancholy disposition, or subject to obstructions of the menses.

Causes of it. The general cause of this, as well as of all other *head-achs*, is a violent congestion of blood directed to the head; and the peculiar causes which determine the *head-ach* to this terrible kind, are ulcerose or exacerated dispositions of the body; they principally are owing to the scurvy, the venereal disease, or any violent cutaneous eruptions driven in, or to external injuries, as blows and wounds of the head ill-treated. The ancients supposed this owing to impoltenness or collections of a viscid matter in the head, and therefore always prescribed blisters, ferrets, and the like, and sometimes the piercing the skull in the part where the pain was most violent.

In the most favourable cases this is a distemper that with difficulty admits of a cure. Where there is a simple ulceration in the case, the cure becomes yet more difficult but not quite to be despaired of; but where a venereal taint is the cause, a cure is scarce to be expected. For though the cause be removed, yet in this or any other kind of *cephalaea*, attended with a caries of the bones, the pain will afterwards often return, and that with little less violence than before.

Those *cephalaea* which sometimes are relieved by nature by copious discharges of serous humours, are more difficult of cure than others; and those which happen to persons of remarkably plethoric habits, threaten an approaching apoplexy.

Method of cure. The same general method is to be observed as in the common *head-ach*, which see above; but in this there are to be added to the medicines there prescribed, such as powerfully dissolve mucous humours; such are the roots of pimpernel, arum, and mallow-wort, with the bitter herbs, salafra, gum ammoniacum, tartarum vitriolatum, and the like. After these, purging is proper; and in cases where the scurvy or any venereal taint is joined, there must be always regard had to those complaints in the whole method of cure; and, indeed, the scorbutic *cephalaea* should always be treated as the scurvy itself, and the venereal *cephalaea* as the pox; and the patient, after proper evacuations, should drink freely of the decoction of the woods, or the decoction of sassafras with raihus and hiquore; these promote perspiration and sweeten the humours. When a collection of matter is felt under the skin, it must be discharged by an incision, otherwise it will render the bone carious; and

and where any old ulcers have been dried up, or any other habitual discharge stopped, and the complaint is owing to that, the making ulcers or fetons must be precluded to any other attempt of a cure. Some inveterate complaints of this kind have been happily cured by mercury, whether they had or had not any thing venereal in their foundation; and in general, a salivation is a sort of last resource, be the origin what it will. *Juncker's Comp. Med. p. 96, 100, 104, 116, and Buchan's Dispens. Med. p. 283, edit. 1776.*

HEAD-HERM, or **HEAD-BORING,** signifies the person who is the chief of the *FRANK-PLEDGE*, and had actually the principal direction of those within his own pledge.

He was also called *hurdle-man, hyspolder, now hyspolder, third-horse, riding-man, hyspolder, and hyspolder*, according to the diversity of speech in divers places. This office is now usually called a *hyspolder*.

The *head-herm* was the chief of ten pledges; the other nine were called *hand-herms*, or *pledges-manually*, &c.

By the **HEAD**, in *Sax-Longue*, denotes the state of a ship which is laden deeper at the fore-end than the after-end.

HEAD-FORM. See **FARCIN.**

HEAD-FALL, in *Sax-Longue*, signifies a rope employed to fasten a ship to a wharf, chain, or buoy, or to some other vessel along-side.

HEAD-LAND, in *Halhandry*, is the upper part of a ground left for turning the plough, or that part which is ploughed across at the ends of other lands.

HEAD-LAND, in *Sax-Longue*. See **LAND.**

HEAD-LENS, in a *Ship*, those ropes of all sails which are next to the yards, and by which the sails are made fast to the yards.

HEAD-LENS, in *Sax-Longue*, denotes the situation of any ship or ships, which are the most advanced in a fleet or line of battle.

HEAD-MOULD-FIT, a distill in children, wherein the features of the face, generally the coronal, *sic*, that is, have their edges flat over one another, and are so close locked together, as to compress the internal parts, the meninges, or even the brain itself.

The distill usually occasions convulsions, and is supposed to admit of no cure from medicine, unless soon could be given by manual operation of a division of the features.

The *head-mould-fit* is the disorder opposite to the *HORNED-FETTER*.

HEAD-POT, an exaction of a certain sum formerly collected by the sheriff of Northumberland from the inhabitants of that county, without any account to be made to the king. This was abolished by the statute 23 Hen. VI. cap. 2. Blount.

HEADS, a term used by builders for that kind of tile which they used to lay at the eaves of a house, being the full breadth of a common tile, and but half a tile in length.

HEAD-ROPE, in a *Ship*, is that part of the *SOFT-ROPE* which terminates any of the principal sails on the upper edge, which is accordingly sewed to it.

HEAD-FAIL, in a *Ship*, those which belong to the fore-mast and bowprit; for it is by these that the *head* of the ship is governed, and by which it is made to fall off and keep out of the wind, such are the fore-fall, fore-top-fall, fore-top-gallant-fall, the fore-stay-fall, and the fore-fall with its top-fall: and these in quarter-winds are the chief drawing-falls.

HEAD-SEA is when a great wave or billow of the sea comes right a-head of the ship as it is in her course.

HEAD-FALL, in the *Mongee*. See **CAVEYON.**

HEAD-FALL, among *Ancient Africans*. See **PIERRE-PA.**

HEAD-IRON, in *Smithery*, is a preparation of tin-ore toward the fitting it for working into metal. When the ore has been pounded and twice washed, that part of it which lies uppermost, or makes the surface of the mass in the tub, is called the *head-iron*; this is separated from the rest, and, after a little more washing, becomes fit for the blowing-house.

HEAD-TO-WIND, in *Sax-Longue*, denotes the situation of a ship or boat when her head is turned to windward.

HEAD-WAY signifies the motion of advancing at sea, and is generally used when a ship first begins to advance, or, in calm weather, when it is doubtful whether the be in a state of rest or motion.

HEALFANG, HEALFYANG, or HALFYANG, in our *Ancient Customs*, signifies *collationem*, or the punishment of the *pillory*.

The word is compounded of two Saxon words; *half, neck, and pangem*, is contain: *Pena fillet qui alium collum stringitur*. The *halfang*, however, cannot signify a pillory in the charter of Causton, D. Forellus, cap. xiv. *Et pro capto filio regi daret solidos, quia Domini tunc halffang.*

HEALFANG is also taken for a pecuniary punishment or

multa, to commute for standing in the pillory; and is to be paid either to the king or to the chief lord.

Que falsum testimonium dedit, reddat regi, vel terre domini healing. Leg. Hen. I.

HEALING, in its general sense, includes the whole process of curing or removing a disorder, and recovering health.

In this sense, medicine is defined the art of *healing*.

In its more restrained sense, as used in surgery, *healing* denotes the uniting or consolidating the lips of a wound or ulcer.

The medicines proper for this intention, are called *incarnatives, agglutinatives, vulneraries*, &c.

Dr. Keel has a discourse of *finative or healing springs and waters*, in the Philosophical Transactions, N° 20.

HEATING, in *Architecture*, denotes the covering the roof of a building.

The *heating* is various; as of lead, tiles, slate, Mortar-bene, dungles, or reed and straw.

HEALTH, a due temperment or constitution of the several parts whereof an animal is composed, both in respect of quantity and quality. Or it is that state of the body wherein it is fitted to discharge the natural functions perfectly, easily, and durably.

Health is the state or condition opposite to *disease*.

The preservation and restoration of *health* make the objects of the art of medicine.

The continuance of *health* depends, principally, on the six non-naturals, viz. air, food, exercise, the passions, evacuation and retention, and sleep and waking. See each in its place.

Injuries, affecting a man's *health*, are those in which, by any unwholesome practices of another, he sustains any apparent damage in his vigour or constitution; as by selling him bad provisions or wine, by the exercise of a noxious trade, or by the neglect of useful management of his physician, surgeon, or apothecary. For these injuries there is a remedy in damages by a special action of trespass upon the case. The stat. 5 Hen. III. lib. 6. prohibits the sale of corrupted wine and unwholesome flesh, or flesh lough of a year, under pain of imprisonment for the first offence, prison for the second, fine and imprisonment for the third, and abjuration of the town for the fourth; and by stat. 12 Ed. II. cap. 25. any brewing or adulteration of wine is punishable with the forfeiture of food, if done by the wholesale merchant, and 40s. if done by the vintner or retailer. See **PLAGUE** and **QUARANTAIN**.

The ancients personified, and even deified, *health*; or, rather, they erected a goddess, to whom they supposed the care of *health* to belong. The Greeks worshipped her under the name *Hygiea*, and the Latins under that of *Salus*. The place of her worship at Rome, was on the Mons Quirinalis, where she had a temple, and a statue crowned with medicinal herbs. We frequently find the goddess *Health* on the reverse of medals. She is represented crowned with laurel, with a serpent stretched on her left arm, and holding a patera to it with the right. Sometimes she has an altar before her, with a serpent twisted round the same, and raising its head to take something off from it. The inscription is *SAT. AVG.*

HEALTH, *house of*, a kind of hospital or public building, for the reception and entertainment of persons infected with the plague, or coming from places infected therewith. See **FEVER-HOUSE**, **QUARANTAIN**, &c.

In the like sense we say, officers of *health*, certificate of *health*, &c.

HEAM, in *beasts*, denotes the same with *after-birth* in women.

Thyme, penny-royal, winter-sweaty, and common horse-bone, boiled in white-wine, and given to a mare, are esteemed good to expel the *heam*. Dittany, applied in a pessary, expels the *heam*, as well as the dead foal; so also do fennel, hops, fawn, angelica, &c.

HEARING, *auditus*, the act or faculty of perceiving sounds. *Hearing* is reckoned among our external senses. Its organ is the ear, and particularly the auditory nerve diffused through the fame; and its object, certain motions or vibrations of the air.

Hence *hearing* may be more scientifically defined, a sensation, whereby, from a due motion impressed on the fibrillae of the auditory nerve, and communicated thence to the sensory, the mind perceives and gets the idea of sounds.

Philosophers have differed as to the immediate organ of *hearing*. Aristotle will have it to be the cochlea and tympanum, and takes the sense of *hearing* to be seated therein. Hist. Animal. cap. 10. in which he is followed by Galen, lib. viii. De Usu Part. See **TYMPANUM**.

The moderns speak of the point on which better ground.

The ear, and the several parts thereof, membranes, canals,

nals, labyrinth, nerves, &c. they say, are the only means and vehicles for the reception, modification, and transmission of the sonorous matter to the brain, which is the seat of the sense.

A sound, in effect, is nothing but a certain rarefaction or modulation of the external air, which, being gathered by the external ear, passes through the meatus auditorius, and beats upon the membrana tympani, which moves the little bones in the tympanum.

In the manner, as this is lost by the external air, these little bones move the internal air which is in the tympanum and vestibulum; which internal air makes an impression upon the auditory nerve in the labyrinth and cochlea, according as it is moved by the little bones in the tympanum: so that, according to the various resistance of the external air, the internal air makes various impressions upon the auditory nerve, the immediate organ of hearing, which different impressions represent different sounds. See *Ear*.

So Isaac Newton carries the thing somewhat farther, and supposes hearing, like seeing, to be performed not immediately by the vibrations of the air, but by those of some other more subtil medium, excited in the auditory nerve by the tremors of the air, and propagated through the solid capillaments of the nerve to the place of sensation.

The curious structure of the labyrinth and cochlea tend to make the weakest sounds audible, for the whole organ of hearing being included in a small space, had the auditory nerve run in a straight line, the impression would only have been made on a very small part of it; and the strength of the impression being, *ceteris paribus*, always as the number of parts on which the impression is made, sounds which are now how could not have been heard at all. If the auditory nerve had, like the retina, been expanded into a large web, which had covered or lined some wide cavity, the impression of sounds, even in this case, had been much weaker than they are now; for this large cavity had given room for the sounds to dilute, and all sounds grow weaker as they dilute.

But these inconveniences are prevented by the present structure of the labyrinth and cochlea, whose canals, by their winding, contain large portions of the auditory nerve, upon every point of which the smallest sound being at once impressed becomes audible; and by their narrowness they are hindered from dilating; and the impressions made upon the nerves by the first dilatations are always the strongest.

The strength of the impression in narrow channels is likewise increased on account of the elasticity of the sides of the bony canal, which, receiving the first and strongest impulses of the air, do reverberate them more strongly upon the auditory nerve.

It may be observed, that though the air be the usual matter of sound, so that a bell rung in vacuo is not heard at all, yet will most other bodies, properly disposed, do the office of air, but some more faintly than others.

Thus may a sound be heard through water, or even through earth, of which we have various instances.

Add, that though the ear be the ordinary organ of hearing, yet Hippocrates, a Danish physician, maintains that one may hear with the teeth. Thus, if one end of a knife, or the like, be applied to a harpsichord, and the other held between the teeth, the music thereof will be plainly heard, though the ears be ever so closely stopped. But this, perhaps, may more properly be referred to the sense of *touching*.

Such as want the sense of hearing are said to be *mute* or *deaf*. See *Deafness*.

HEARING, difficult. In common cases, difficult hearing suddenly coming on, the following is an excellent remedy: take essence of amber a dram, of callos a scruple, oil of chamomile half a scruple, oil of amber one drop mix these together, and three or four times a day put into the ears a piece of cotton wetted in them. This is a complaint frequently happening to young women, from a supposition of the menses; and, in that case, there is no more required for a cure than liberty to restore that discharge in its natural and proper course. If sometimes also it proceeds from a stoppage of the humoral discharges, that is then to be cured by recalling them, and applying leeches to the part; or, if the patient is weak to that, bleeding or cupping often prove an immediate cure. When the difficulty of hearing arises from any obstruction in the auditory passage, the matter that causes the obstruction is to be carefully removed by a surgeon.

Old men often have a difficulty of hearing from mere debility and loss of the due strength and tone of the parts. In this case medicine can give no assistance, but all applications usually render the case worse: and the same

is to be observed in all cases where the disorder is very inveterate, or is hereditary, or owing to external injuries, by which the tympanum has been broken, or any other of the principal parts are destroyed. The total loss of hearing, after having held a person for many years, and not been at all relieved by the common methods of cure, has been sometimes known to go off of itself, and the patient to hear as perfectly as ever: so that we are not to despair of relief, even in the worst cases of this kind, and such as have resisted all remedies. Persons who are subject to returns of this complaint, should use frequent bleeding or cupping, be moderate in diet, and then all species of strong liquors, and use moderate exercise. Heister also affirms, on his own experience, that the drinking the mineral waters in the spring, in the proper and regular manner, is of the utmost service in preferring the patient from returns of this disorder during the year. Heister's Compend. Med. p. 180.

Mr. Le Cat, in his treatise on the organ of sound, proposes an instrument, at his own invention, to assist dull hearing: it consists of a shell or corner of copper, into which a small funnel-like tube is fixed, so that its narrow end is at the centre of the concha. See *Phil. Trans.* N^o 450. § 3. See *Deafness*.

HEAR is particularly used in civil and judicial concerns, for a cause being brought before the judge and jury, and the parties being heard as to the merits thereof.

The method of hearing causes in the court of Chancery is this: the parties on both sides appearing by their counsel, the plaintiff's bill is first opened or briefly abridged, and the defendant's answer also, by the junior counsel on each side; after which the plaintiff's leading counsel states the case and the matters in issue, and the points of equity arising from thence; and then such depositions as are called for by the plaintiff are read by one of the six clerks; and the plaintiff may also read such part of the defendant's answer as he thinks material or convenient; and, after this, the rest of the counsel for the plaintiff make their observations and arguments. Then the defendant's counsel go through the same process for him, except that they may not read any part of his answer; and the counsel for the plaintiff are heard in reply. When all are heard, the court pronounces the decree, adjusting every point in debate according to equity and good conscience; which decree, being usually very long, the minutes of it are taken down, and read openly in court by the registrar. Blackst. Com. vol. iii. p. 451. 470.

The hearing of ambassadors at the courts of princes, is usually called *audience*.

HEARSE, among *Hansens*, a hind in the second year of her age. See *Hunting*.

HEARSE is the name of a well known carriage, used for conveying the dead to the grave.

The word is also used by Shakespeare in his Henry VI. for a monument erected over a grave.

HEART, *cor*, in anatomy, a muscular part of the animal body, situated in the thorax, on the anterior part of the diaphragm, between the two laminae of the mediastinum, whence the veins all terminate, and from which all the arteries arise, and which, by its alternate contraction and dilatation, is the chief instrument of the circulation of the blood, and the principle of life. See *Tab. anat. (Splanchn.) fig. 12. lit. cc.*

This noble part is included in a capsula or pouch, called the *PERICARDIUM*, whose structure and office will be explained under that article.

The figure of the heart is a cone or pyramid, reversed, flattened on the sides; the upper and broader point whereof is called the *base*, and the lower the *coronary*, or *papal*; this is joined a little towards the left side.

The magnitude of the heart is indeterminate, and different in several subjects, according to their respective dimensions. Its ordinary length is about six inches, its breadth at the base four or five; and the whole circumference, fourteen. Its place is in the middle of the thorax, between the two lobes of the lungs; and it is lodged in the pericardium, and supported by the great blood-vessels, to which alone it is immediately connected, being, for the convenience of its motion, disengaged from any other impediments. It is covered with a thin membrane, called the *epicardium*, is guarded with fat, and which is no other than the common membrane of the muscles.

It has two great cavities called *ventricles*, somewhat unequal, one of which is thick and folds the other thin and soft; this latter, called the *right ventricle*, being larger, and capable of containing between two and three ounces of blood. They are divided by a fleshy partition, consisting of the same muscular fibres with the parietes themselves, and called the *septum*; the figure whereof is concave towards the left ventricle, and convex towards the right. There is no immediate communication between

tween the ventricles; but for the blood to pass out of one into the other, it must fetch a round through the lungs.

The parietes or sides of these ventricles are of a thickness and strength very unequal; the left much exceeding the right because of its office, which is to force the blood through all the parts of the body; whereas the right derives it through the lungs only, and is therein greatly assisted by other parts. The right ventricle, in effect, seems only intended with a view to the lungs; whence, in such animals as have no lungs, we only find one ventricle, which is the left.

In the ventricles are little muscles, called *columnæ carneæ*, or *lacini*; these are derived from the parietes, and connected by tendinous extremities, to the valves of the heart hereafter mentioned.

The ventricles are capped each with an auricle or little muscle, confining, like the ventricles themselves, of a double order of fleshy fibres.

The vessels, either arising from, or terminating in the heart and its auricles, are two arteries, viz. the aorta and the pulmonary artery, which have their origin from the two ventricles, viz. the aorta from the left, and the pulmonary from the right; and two veins, which terminate in the auricles, viz. the caval vein in the right, and the pulmonary vein in the left.

At the respective orifices of these vessels are placed valves; particularly at the orifice of the arteries, within each of them, are three semilunar valves, or membranes of a semilunar figure, which close the orifice of the artery, and hinder the reflux of the blood in the heart at the time of its dilatation. At the mouth of the right ventricle, just at its junction with the auricle, are three others called *tricuspidæ*, from their three points being fastened by tendinous fibres to the columnæ carneæ; so that, upon the contraction or systole of the heart, they close the orifice, and hinder the blood from recurring into the great vein. The same office is performed by the two mitral valves, at the exit of the left ventricle, stopping the return of the blood into the pulmonary vein.

The substance of the heart is entirely fleshy or muscular. The ancients, indeed, generally took it for what they call a parenchyma; but Hippocrates had a juster sentiment, and after him Steno and the moderns have evidently found it to consist of a continued series of proper muscular fibres, variously contorted or wound up; and ending at the orifices of the respective ventricles, where they form the tendons.

In dissecting the heart, after taking off the proper membranes, there appear, on the outer surface of the right ventricle, some slender flat fibres, tending to and ending in the bulbi. Immediately under these there is a double order of spiral fibres, the exterior whereof ascend obliquely from the septum to the bulbi, and form a sort of helix or cochlea; the interior take a contrary course, winding obliquely from the right side towards the left, so as to compass both ventricles, and ending in the bulbi on the left side, form likewise a helix of an inverse order. Under these appear the fibres of the left ventricle; and first, a spiral series running to the left, under which, as in the other ventricle, lie another order running the contrary way, which not only extend to the outward paries, but encompassing the whole ventricle, make the septum more immediately appertain to, and be a part of, the left ventricle. Some of them, instead of terminating, as the rest do, in the tendons of the heart, run inwards, and form the columnæ carneæ, while others, reaching down to the cone, are wound about it, and form the circle called the *anulus of the heart*.

The fibres of the heart appear to be the same with those of the other muscles, whence the part now generally posited for a real muscle, though some think that inference not very just, inasmuch as the aorta has the same claim to be reputed a muscle.

Some late authors, upon considering the structure and disposition of the spiral fibres, chuse rather to make the heart a double muscle, or two muscles tied together. In effect, the two ventricles, with their respective auricles, are found two distinct bodies, two vessels or cavities, which may be separated, and yet remain vessels; the septum, which was supposed to belong only to the left, being now found to consist of fibres derived from them both. To say no more, the two ventricles, according to Mr. Willems, are two several muscles united together, not only by the septum, but by several plans of fibres arising from the exterior base of the heart, and meeting at the apex, which, entering the left ventricle, form the parietes, &c.

The heart has also its proper blood-vessels, viz. two arteries springing from the entrance of the aorta, and one larger vein, with one or two lesser; all which, from their encompassing the heart, are called *coronariæ*.

The nerves of the heart, and its auricles, come from a plexus of the par vagum, called by Willis, *plexus coronarius*. It has also lymphatics, which carry the lymph from the heart to the thoracic duct.

The use of the ventricles of the heart, and its appendant auricles, is to circulate the blood through the whole body; in order to which, they have an alternate motion of contraction and dilatation. The two ventricles may be considered as two syringes, so closely joined together as to make but one body, and furnished with suckers placed in contrary directions to each other, so that by drawing one of them a fluid is let in, and forced out again by the other. By the dilatation, called the *diastole*, the cavity of the ventricles is opened, and their internal dimensions enlarged to receive the reudent blood from the veins, which is forced into them through the tricuspidal valves, by the contraction of the auricles, where it is lodged; and by the contraction of the ventricles, called the *systole*, their cavity is shrunk, and their diameters lessened, so that the blood is forced toward the base of the heart, and made to pierce the tricuspidal valves against each other, to open the femoralis, and to rush with impetuosity through the arteries and their ramifications; and from thence it is forced to return by the veins to the auricles which receive and lodge it during the time of a new contraction.

Hence it appears, that these alternate motions of the heart and auricles are opposite, in time, to each other; the auricles being dilated whilst the heart is contracted; and contracted whilst it is dilated, to drive the blood into it.

By means of the right ventricle, the blood is driven through the pulmonary artery; from which being received into the pulmonary vein, it is returned to the left ventricle; from which, by the aorta, it is distributed all over the rest of the body, and thence returned to the right ventricle by the vena cava; so making an entire circulation through the whole body. See *Circulation of the Blood*.

Scalichius gives an account of a man who had no heart; but Menestrius denies it, as also that there ever were two hearts found in any man, though the case be common in divers insects, which have often naturally several hearts; worms fill worms, which have a chain of hearts running the whole length of their bodies. But we have, in other authors, instances of two hearts, even in the same man. There have been hearts found all gnawed and deformed with worms. Mercurius opened the heart of some bandy, which were all hairy, or at least covered with a tomentum or down. And, what is still more extraordinary, we have accounts of persons in whom the heart has been found inverted, or turned upside down; particularly in a woman hanged some time ago in Saxony, and a man hanged at Paris.

Tumorous animals have always larger hearts than sanguineous ones, as we see in dogs, hares, allies, &c.

Dr. Hales conjectures, that one reason of this may be, that the fibres of the tumorous are generally more lax than those of sanguineous animals; on which account the blood passing with less resistance through the lax-fibred capillary vessels, it is requisite that the heart should at each pulse throw out a greater quantity of blood, in order to supply its more easy and plentiful flow through the lax capillary arteries into the veins; and this may also be the reason why the pulses of young animals, as of children, are found to beat faster than those of grown persons; because the tender fibres of the coats of their blood-vessels being very lax, give less resistance to the flowing blood, whose globules are observed by Mr. Leuwenhoek to be all of a size, both in great and small animals; whence it was needful to make provision for a proportionably greater supply of it from the heart, by increasing the velocity of its pulsations and contractions. *Hæmodynamics in Statical Ed. vol. ii. p. 29.*

There is a bone sometimes found in the basis of the heart of certain animals, particularly deer, which seems to be no other than the tendons of the fibres of the heart imbricated and ossified.

Histarians relate, that pope Urban VIII. being opened after his death, was found to have such a bone in his heart. This case is very usual in the trunk of the aorta, which springs from the heart.

Many amphibious creatures, as frogs, &c. have but one ventricle to the heart. The contrary is said, by the French academists, to have three ventricles. M. Borelli charges this on them as a mistake, and maintains it has but one. The point is scarce yet ascertained. *Mém. de l'Acad. des Sciences, 1703, and Phil. Trans. N° 328.*

HEART, theory of the nature of the. The principle of motion in the heart, or the power from which its alternate contraction and dilatation arises, has been greatly controverted among the late physicians and anatomists. See DIASTOLE and SYSTOLE.

The proportion of the weight of the *heart* to that of the body is greater in the males than in the females of birds, both wild and tame. But this proportion differs less in the males and females of wild birds than of tame birds, which may probably be owing to the exercise of the former being more nearly equal than that of the latter.

The proportion of the *heart* to the body is much greater in birds than in fish, at a medium about 8 to 1. Dr. Robinson thinks this great difference is owing to the vastly superior heat of birds.

Dr. Bryan Robinson has given us a table of the mean weights of the bodies, *hearts*, and livers of several species of birds and fishes, as also of the proportions of the *hearts* and livers to the weight of the body, and of the liver to the weight of the *heart*. It appears from these tables, that the proportion of the weight of the *heart* to the weight of the body is greater in wild birds than in tame birds: the former use more exercise, or move their muscles more than the latter, and it is known that the motions of the *heart* and blood are much increased by the motion of the muscles: on the contrary, when the quantity of motion in the muscular system is greatly diminished by the inactivity of bodies, the force of the *heart* and motion of the blood will likewise be diminished in the same proportion. But muscles which are much moved always increase in magnitude, weight, and strength; and yet bodies that use much muscular motion are seldom observed to grow fat, or increase in weight; and therefore the weight of the *heart* in proportion to the weight of the body will be greater in wild animals than in tame, and in bodies which use much exercise than in bodies which are inactive.

The weight of the *heart* in proportion to the weight of the body is greater in small birds than in large ones. It is likewise greater in a mouse than in an ox, in a child than in a man, and probably greater in little men than in large men. Now since small animals are generally more active than great animals, we may allow the activity of the body to depend much on the proportion of the weight of the *heart* to the weight of the body. Diff. on the Food and Diet, of Hum. Bod. p. 103, 104.

The proportion of the weight of the *heart* to the weight of the body is less in fat bodies than in lean. As animals grow fat the weight of their bodies increases, and their quantity of blood and weight of *heart* lessen; for the fat in the membranes compresses the blood-vessels, and lessens the quantity of blood, and as this lessens, the weight of the *heart* lessens; the weight of the *heart* and quantity of blood always increasing and decreasing together. Diff. on the Food, &c. of Hum. Bod. p. 103, 108. Various unnatural accidents happen to the *heart*, and are the causes of disorders, which are never understood till too late, on the dissolution of the body. Of this kind Mr. Hanwell shewed the Paris Academy a remarkable instance in the *heart* of a woman of thirty years old; in this the valves of the left auricle were joined and cemented together, and left only a very small aperture formed in the middle of the plane made by their re-union; the blood coming from the lungs into this auricle, could not without a very great and unnatural difficulty, pass thence into the ventricle; and the auricle, compelled by this to extend itself to contain a large quantity of blood, was become much larger than it ought to have been in its natural state. In different parts of the united valves there appeared several little points where an ossification was begun; the woman died phthisical, nor could it be otherwise, since the lungs could not but be affected by the difficulty with which the blood entered into the left ventricle of the *heart*; and the gentleman who gave the account observed, that this was no single instance of a case of this kind, but that he had met with several such, particularly one in the right auricle of the *heart* of a girl of fourteen. Another instance of a remarkable distemperature of the *heart* is given by Mr. Du-Fay of the same Academy: a man who had lived to thirty-four in very good health, became at this age very subject to the vapours, but the complaint increased to no particularly violent degree for the space of eighteen years, but at this time he perceived a palpitation of the *heart* to join with the other symptoms, and this held him to the time of his death, which was two years afterwards. *Mém. Acad. Science. Paris, 1735.*

These palpitations, which were slight at first, became afterwards so strong, that they communicated their motion to the sides, and might be seen through the patient's cloaths even when he was dressed; if the hand were applied to the region of the *heart*, it was perceived to move very forcibly, and the arteries all paroxysm of the disorder, while the veins were all considerably swelled in the upper part; in the latter part of his life he became dropsical, his legs swelling violently. On opening his body, the cavities of the breast and belly were

found to be full of water, the lungs were found, but considerably wasted; the liver and spleen somewhat larger than ordinary, and the pancreas very large, and very hard and fibrous; the *heart* weighed above two pounds, and was so large that it threw the left lobe of the lungs towards the upper part of the breast; it measured fifteen inches round at the base, and the two ventricles were full of blood, the right was nearly of its natural size, but the left, which ought to be smaller than that, was so distended as to be vastly larger, though its sides had not at all lost their thickness; the pericardium was somewhat thicker than ordinary, and was nicely applied to the *heart*, but had on one side a tumor of the size of an egg, full of blood; the aorta was ossified at the place where it goes out of the left ventricle. Mr. Du-Fay esteems this case to have been an extraordinary aneurism of the left ventricle of the *heart*, a case seldom heard of. Another scarce less memorable instance there is in the Memoirs of the same Academy, which proves that wounds of the *heart* are not always so immediately mortal as is generally supposed; the case is this, a soldier was brought into one of the hospitals with a wound made by a sword in the upper part of the left breast; he seemed very well for three days, but on the fourth he was taken with a fever and difficulty of respiration, and in five died on the tenth day. On opening the body it was found that the sword had pierced the pericardium, traversed the right ventricle of the *heart* in its lower part, and near the point, and pierced the pericardium on the opposite side, and gone through the diaphragm, and an inch deep into the liver; there was much blood found in the pericardium, a little clot of coagulated blood in the wound in the *heart*, and a quantity of purulent water on each side of the breast.

We have an account of a child which lived several days, yet upon dissection its *heart* was found without a pericardium, and named epide-down, so that its *beats*, with all the vessels, had fallen down as low as the navel, and its apex flit on the left side far below between the two lungs. See Phil. Trans. N^o 457. 1687-7.

Mr. Boyle tells us of a kind of fish on the coast of Ireland, about the size of mackerel, the *heart* of which was inverted, the basis lying towards the tail, with the aorta pointing to the head, and adhering to the aorta.

Some creatures are known to live a considerable time after their *hearts* are taken out: Mr. Boyle mentions frogs swimming in this condition, and living above an hour; and the *heart* of an animal often gives signs of life after excision. The same author mentions the *heart* of a chicken unattached, but perfectly formed, which continued to beat above an hour after the head and breast-bone were clipped off to disclose it; and when the *heart* was dead to appearance, it might be excited to fresh motion by puncture; the motion was also again excited by placing the part in the steam of warm water, and thus the *heart* was kept beating for two hours and a half. See Boyle's Works abridg. vol. i. p. 28.

The *heart* is a solitary muscle of very great strength, and the intercostal muscles and diaphragm, which likewise have no antagonists, are a vast additional force, which must be balanced by the contrary action of some equivalent power or other; for though the action of the intercostal muscles be voluntary, it does not exempt them from the condition of all other muscles serving for voluntary motion, which would be in a state of perpetual contraction, notwithstanding any influence of the will, if it were not for the liberation of antagonistic muscles. This liberation between other muscles, is answered by the weight of the incumbent atmosphere, which presses upon the thorax and other parts of the body; as in all other voluntary motions, the influence of the will only gives a prevalence to one of the two powers before equilibrated; so here it serves to enable those muscles to lift a weight too ponderous for their strength not to afford: so that as long as this assistance is withdrawn, the ribs are again depressed by the mere gravitation of the atmosphere, which would otherwise remain elevated through the natural tendency of those muscles to contraction: this is evidently proved from the Torricellian experiment, and those made upon animals in vacuo, where, as soon as the air is withdrawn, and the pressure thereby taken off, the intercostal muscles and diaphragm are contracted, and the ribs elevated in an instant, and cannot by any power of the will be made to subside, till the air is again let in to bear them forcibly down. As in the elevation of the ribs, the blood, by the passage opened for it, is in a manner solicited into the lungs, to its depression, by the subsidence of the lungs, and contraction of the blood-vessels consequent thereto, the blood is forcibly driven through the pulmonary vein into the left ventricle of the *heart*; and thus, together with the general compression of the body by the weight of the atmosphere

atmosphere which surrounds and presses on its whole surface, is that power which causes the blood to mount in the veins, after the force impressed upon it by the heart is broken and spent, and which suffices to force the heart from its natural state to dilatation.

Upon computing the weight of the column of air equal to the surface of the body, it appears however sufficient for the effects here ascribed to it, and considering that the bodies of animals are compressible machines, it appears that it must of necessity affect them in the manner here laid down; and yet though our bodies be entirely composed of tubuli, or vessels filled with fluids, this produces how great force, being equal every way, could not affect them, were it not that the superficial dimensions are equally variable; because, being compressed on all parts with the same degree of force, the contained fluids could not any-where begin to recede, and make way for the rest to follow, but would remain as fixed and immovable as if they were actually solid.

But, by the dilatation of the thorax, room is made for the fluids to move, and by the cessation of it, fresh motion is impressed; which is the great spring whereby the circulation is set and kept going.

This reciprocal dilatation and contraction of the superficial dimensions of the body form so necessary to animal life, that there is not any animal so imperfect as to want them, at least none to which our anatomical inquiries have yet reached; for though most kinds of fish, and insects, want both moveable ribs and lungs, and consequently have no dilatable thorax, yet that defect is supplied by an analogous mechanism, answering sufficiently the necessities of their life. Thus fishes, which have no lungs, have gills to do the office of lungs, receiving and expelling alternately the water, whereby the blood-vessels suffer the same alteration of dimensions as in the lungs of more perfect animals.

Add that the lungs, or air-vessels, of insects are much more different from those of perfect animals, than those of fishes are, and yet in their action and use, they agree perfectly with both; that is, removing and expelling the air, and varying the dimensions and capacities of the blood-vessels; having no thorax, or separate cavity for the heart and air-vessels, the latter are distributed through the whole trunk, by which they communicate with the external air through several spiracles or wind-holes, to which are fitted so many little tracheae or wind-pipes, which thence send their branches to all the muscles and viscera, and seem to accompany the blood-vessels all over the body, as they do in the lungs of perfect animals; by this disposition, in every inspiration the whole body is inflated, and in every expiration compressed, and consequently the blood-vessels must suffer a violence of extension and contraction, and a greater motion be thereby impressed on the contained fluids than the heart, which in these creatures does not appear to be muscular, would be capable of giving. The only animal exempt from this necessary condition of receiving and expelling alternately some fluid in and out of the body is a roach, but this, which included in the womb, seems to have little more than a vegetative life, and ought scarce to be reckoned among the number of animals; and were it not for that small share of muscular motion which it exercises in the womb, it might without absurdity, be accounted a graft upon, or branch of, the mother.

One difficulty we must not here conceal, which will lie against the whole doctrine, viz. that the hearts of several animals have been found to beat regularly, and strongly, even in *vacuo*, not less than in the air. Witness the hearts of frogs, tried by Mr. Boyle. Phil. Trans. N° 62. Dr. Keil objects to this hypothesis; alleging, that the pressure of the atmosphere on the surface of our bodies cannot supply the place of antagonistic muscles, because the air within us is always in equilibrium with the external air, and consequently the pressure of the atmosphere can neither promote nor retard the contraction of the thorax, or the dilatation of the heart; and he ascribes their alternate contraction and dilatation to the influx of the blood or animal spirits. *Ann. p. 133. edit. 1759.*

Albert Haller, M. D. ascribes the motion of the heart to a stimulus impressed upon it by the blood; in proof of this he urges, that the right auricle and ventricle do persevere longer in a state of contraction than the left, because they are longer stimulated by the venous blood: the fact is known, and inferred by Boerhaave from the experiments of Galen and Harvey. Dr. Haller made several experiments to prove that this was owing to the efflux of the venous blood: he contrived to exclude the blood from the right ventricle and auricle, and to hinder it from quitting the left ventricle; and thus by retaining the stimulus, he caused the motion of the left ventricle to subside, and thence inferred that the motion of the

heart depends upon the stimulus of the blood; for this purpose, after cutting the veins of cats and kids, which were the animals he used, he opened the pulmonary artery, in order perfectly to empty the right ventricle of its blood, keeping the left ventricle full by a strong ligature on the aorta; he then found that the right ventricle was at rest, and that the left and its auricle were in motion; according to this process the part which kept longest alive, which is commonly the right auricle, was now the left ventricle, that being the longest kept stimulated by the blood. *Mem. Acad. Sc. Göttingen, vol. 1.*

Haller, *estimate of the force of the heart*. The quantity of the force of the heart has been variously estimated, and on various principles, by various authors, particularly Borelli, Marland, Keil, Jurin, &c.

The force of the heart may be defined by the motion wherewith the heart contracts, or by the motion of a weight which being opposed to the blood at its exit out of the heart, will just balance and stop the fame; this we have no way of coming at *a priori*; the internal structure of the part, and the nature and power of the contracting cause, being but imperfectly known; so that the only means remaining is, to estimate it by the effects.

All the action of the heart consists in the contraction of its ventricles; the ventricles contracting, strike or press upon the blood, and communicating part of their motion thereto, drive it out with vehemence: where the passage is open: the blood thus protruded into the aorta and pulmonary artery, presses every way, partly against the coats of the arteries, which by the last diastole had been left in a collapsed, flaccid state; and partly against the anterior blood moving on too slowly before it; by such means the coats of the arteries are gradually distended, and the antecedent blood has its motions accelerated. By the way it may be observed, that the more flaccid the arteries are, the less resistance they will make to a dilatation, and the more they are dilated, the more strongly will they resist a farther distention; so that the force of the blood, at its egress out of the heart, is at first spent in distending the arteries more than in protruding the antecedent blood, but afterwards more in protruding the blood than in distending the arteries.

Borelli, in his *Osceon Animal*, makes the obstacle to the motion of the blood through the arteries, equivalent to 180,000 pounds; and the force of the heart itself only equal to 3000 pounds, which is only one sixtieth of the opposition it has to overcome; then deducting 45,000 pounds for the adventitious help of the muscular elastic coat of the arteries, he leaves the heart with a force of 3000 pounds to overcome a resistance of 135,000 pounds, that is, with 1 to remove 45; which he supposes it enabled to do by virtue of percussion. See DIAPHRAGM. But if he had proceeded in his calculation to the veins, which he allows to contain quadruple the quantity of blood found in the arteries, and to which this energy of percussion either does not reach at all, or but very languidly, he would readily have seen the system of percussion to be insufficient.

But his calculus itself is also found to be faulty; the force ascribed by him to the heart being immensely too great. Dr. Jurin shews, that if he had not made a mistake in the computation, the resistance which the heart has to overcome, must have come out, on his own principles, much greater; and instead of 135,000 pounds, would have been 1,075,000 pounds, which transcends all probability.

The great fault in his solution consists, according to Dr. Jurin, in his estimating the motive force of the heart by a pondus at rest, in supposing the whole weight sustained by a muscle, in one of his experiments, to be sustained wholly by the contracting force thereof; in assuming muscles equally heavy to be of equal force, and in supposing the utmost force of the heart equal to every systole.

Dr. Keil, in his *Essays on the Anim. Osceon*, first ventured to set aside Borelli's calculus, and substituted another, almost infinitely smaller in its head: his method of estimating the force of the heart is as follows: having the velocity wherewith a fluid flows out at an orifice, without meeting any resistance from an anterior fluid; the force which produces that motion is thus determined: Let the line *AB* be the height from which a falling body will acquire a velocity equal to that wherewith the fluid flows out at the orifice; then is the force, which produces the motion of this fluid, equal to the weight of a cylinder of the same fluid, whose base is equal to the orifice, and weight equal 2 *A B*. Corol. 2 Prop. 36. lib. ii. Newton.

Now the blood flowing out of the heart is resisted, in its motion, by the anterior blood in the arteries and veins, and therefore cannot flow with all the velocity which the force

of the heart will give it, part of that force being spent in overcoming the resistance of the mass of blood; it therefore, we knew how much the velocity of the blood is diminished by this resistance, or what proportion the velocity of the blood resisted has to the blood driven out, and not resisted; having already determined the velocity of the blood as it is resisted, we might easily collect the velocity by which the blood would flow were it not resisted; and from thence find the absolute force of the heart. To find this, the author made the following experiment: having uncovered the iliac artery and vein in the thigh of a dog, near his body, and passed convenient ligatures under them, he opened the whole diameter of the vein, and receiving the blood which runs from it in the space of ten seconds; the time was afterwards done by the artery for the same space of time, and both the quantities of the blood were exactly weighed: the experiment was repeated for the greater security, till the quantity of blood from the artery was found, as a medium to that of the vein, in the same space of time, nearly as 75 to 3.

Now the velocity of the blood in the iliac artery, so near the aorta, must be nearly the same with that in the aorta itself; and consequently the velocity with which it flows out of the iliac artery cut asunder, is the same with which it would flow out of the heart unresisted, or the blood runs through a wound in the iliac artery with all the velocity it received from the heart; now all the blood which runs along the iliac artery returns again by the iliac vein; and consequently the quantities of blood which pass through both in the same space of time are equal; the quantity of blood, therefore, which runs out of the iliac vein cut asunder, is the same which ran through the iliac artery before it was cut, in that space of time; having therefore the quantity which runs through the iliac artery when it is cut and when it is not cut, we have their velocities; for the velocity of a fluid running through the same canal in equal spaces of time, is directly as their quantities; but the velocity of the blood when the artery is cut, is equal to that it receives by the full force of the heart, and the velocity when it is not cut, is that velocity with which the blood moves through the aorta, resisted by the anterior blood, and therefore these two velocities are to one another as 75 to 3.

If now the heart throws out two ounces of blood every systole, which is a probable assumption, then the blood moves through the aorta at the rate of 150 feet in a minute; and therefore the absolute velocity wherewith the blood would be forced into the aorta, if it found no resistance, is such as would make it move 390 feet in a minute, or 65 feet in a second.

We now proceed to enquire, what is the height from which a falling body will acquire this given velocity? for this height doubled, gives the length of the cylinder whose base is equal to the orifice of the aorta, and weight equal to the absolute force of the heart.

It is known by experiment, that the force of gravity will make a body move 30 feet in a second, which is the velocity it acquires in falling through 15 feet; and therefore this velocity is to the velocity of the blood flowing without resistance into the aorta as 30 to 65; but because the heights from which bodies acquire given velocities, are as the squares of the velocities, that is, as 900 to 4225; therefore as 900 to 4225, so is 15 to 0.74. This height doubled, gives 1.48, or in inches 17.76, which is the height of a cylinder of blood, whose base is equal to the aorta, which we have supposed to be equal to 0.4187; and therefore the solid content is 7.436112: the weight of which is equal to the absolute force of the heart.

This weight is five ounces, whence the force of the heart is found equal only to the weight of five ounces.

Dr. Keil, in his *Anatomy Abridged*, p. 137, &c. supposes that the ventricles of the heart throw out at least one ounce of blood in each systole; and, if the heart contracts 4000 times in an hour, there will pass through the heart every hour 4000 ounces, or 250 lb. weight of blood: and, stating the whole mass of blood to be 25 lb., a quantity equal to this passes through the heart 10 times in an hour, or about once in six minutes. If the heart contracts 80 times in a minute, then 25 lb. weight of blood passes through its ventricles once in five minutes. According to this estimate, the left ventricle of the heart throws out in each systole one ounce, or 1.638 cubic inches of blood, and the area of the orifice of the aorta being = 0.4187; then, dividing the former by this, the quotient 3.9 will be the length of the cylinder of blood, which is formed in passing through the aorta in each systole; and, allowing the number of pulses in a minute to be 75, in 75 pulses a cylinder of 293.5 inches will pass, or the blood will move at the rate of 1462 feet in an

hour: but the systole of the heart being performed in one third of the time of a pulsation, the velocity of the blood in that instant will be three as much; viz. at the rate of 4386 feet in an hour, or 73 feet in a minute. The quantity of blood thrown out in 75 pulses will be equal to 4.4187 oz. and in 34 minutes a quantity equal to a middle-sized man, viz. 158 lb. will pass through the heart. But if, with Dr. Harvey and Dr. Lower, we suppose two ounces of blood, i. e. 3.276 cubic inches, to be thrown out at each systole, then the velocity of the blood in entering the orifice of the aorta will be double the former, viz. at the rate of 146 feet in a minute, and a quantity of blood equal to the weight of a man's body will pass in half the time, viz. 17 minutes. *Hale's Stat. Lib.* vol. II. p. 39.

Dr. Keil has further demonstrated, that the greatest velocity of the blood in the heart is 5233 to 1, or that it moves 5233 times slower in some capillary arteries than it does in the aorta, supposing that it has a free and unobstructed course through these arteries; which is very far from being the case, because the principal obstruction to the progress of the arterial blood is in the capillary arteries, as Dr. Hale has shown, vol. II. p. 28, &c. and since the velocity of the blood at its pulsing from the heart to the aorta is at the rate of 146 feet in a minute, taking one third of that for its continued equal velocity, according to Dr. Keil's estimate, it would move but 0.1128 inch in a minute, in the transcendent arteries in that time.

The number of extreme capillary arteries estimated by Dr. Hale, on the supposition that one ounce of blood be thrown out at each systole, is 4167723; and, on the supposition that two ounces of blood are thrown out at each systole, their number will be 8235446. From the arteries the blood is received into the veins; and, if the number of arteries be to that of the veins as 374 to 441, Dr. Keil concludes, that the blood moves in the veins above 7316 times slower than it does in the aorta.

The same author, by another method of calculating from the laws of projectiles, finds the force of the heart almost equal to eight ounces; which, though somewhat more than was before determined, yet the difference is of small moment in respect of Boerhaave's account, the great failing of whose calculation Dr. Keil takes to arise from his not distinguishing between the blood at rest and the blood already in motion. The force of the heart, it is certain, is not employed in giving motion to any quantity of blood at rest, but only to continue it in motion: how that motion first arose, seems out of the human capacity to determine. It is demonstrable, that if the resistance of the blood always bore the same proportion to the force of the heart it now does, the blood never could be first put in motion by the heart, if the blood constantly moved forwards, with the motion first communicated to it, and did the coats of the vessels make no resistance, the posterior blood would not be retarded by the anterior, and the force of the blood would equal the entire force of the mover; but because of the resistance made by the coats of the blood-vessels, and the force which is spent in distending them, the blood is continually retarded in its motion as it circulates, and would in a short time stop, were not the motion lost made up again by a fresh impulse from the heart; and, therefore, the force of the heart must be equal to the resistance the blood meets with in its motion: if it were more, the velocity of the blood would be continually increasing; if less, it would continually decrease, and at last stop. And hence it is evident, that if the circulation of the blood was once stopped, all the force of the heart could never set it moving again.

Thus much for Dr. Keil's system. Dr. Jurin charges even this with its defects; and, particularly, in that it supposes the weight, whereby the motion of water running out of a vessel may be generated, to be what generates that motion, which this last author takes for a misapprehension of Sir Isaac Newton's corollary, urging, that the water falling by the power of gravity, acquires its motion of itself, and that the weight falling the same time, only receives a motion equal to that of the water out of the vessel. There are some other points which he objects against, and of which the learned author has an express vindication in the *Philosophical Transactions*; to which his antagonist has since replied; but the author dying in the mean time, the dispute ceased.

Dr. Jurin, however, proceeds to give another comparison, on more unexceptionable principles; though his adversary has found occasion therein for recrimination. He considers one of the ventricles of the heart impelling the blood, as a given body impelling another at rest, with a given velocity, and, after communicating part of its motion thereto, proceeding with the same common velocity; on which principle, the force of the heart will either

either be equal to the factum of the weight of the ventricle and its initial velocity before it impels the blood, or to the sum of the motions of the ventricle, and the blood flowing out of the fame, and the motus communicated to the coats of the arteries and the antecedent blood.

Now it is demonstrable. 1. That the motion whereby a hollow machine, unequally contractile, does act in contraction, is equal to the sum of the factums of the several particles of the machine multiplied into their several velocities. Whence it follows, that the motion of the machine is equal to the factum of its weight into some mean velocity between the particles moved swiftly, and those moved slowly. 2. That if the water be expelled out of the orifice of such a machine, the motion of the water bursting out of the fame will be equal to the sum of the facta of any transverse sections of all the threads of water, severally multiplied into their respective lengths and velocities: whence it follows, that the motion of the water is equal to the factum of the water issuing out at the orifice into some mean length between that of the longest thread and the shortest. Hence, also, if there be several such machines full of water, and contracted alike, whether equally, or unequally, the motion of the water, bursting out at the orifice of one of them, will be in a ratio compounded of the quadruple ratio of any homologous diameter of the machine, and the reciprocal ratio of the time wherein the contraction is effected.

From these data is drawn a solution of the problem, To find the force of the heart. For, calling the weight of the left ventricle, or the quantity of blood equal to the fame, p ; the inner surface of the ventricle, s ; the mean length of the filaments, or threads, of blood expelled from the fame, l ; a section of the aorta, a ; the quantity of blood contained in the left ventricle, q ; the time wherein the blood would be thrown out of the heart, were the resistance of the arteries and antecedent blood removed, t ; the variable velocity wherewith the blood would flow through the aorta, if the resistance were taken away, v ; the variable length of the aorta, passed over by the blood, x ; and the time wherein the length x is run, z . The mean variable velocity of the blood contiguous to the ventricle, or the mean velocity of the ventricle itself, will be $\frac{v}{2}$; the motion of the ventricle, $= p \times \frac{v}{2}$; the motion of the blood issuing out, $= v \times \frac{x}{z}$; and their sum, or force of the ventricle, $= p \times \frac{v}{2} + v \times \frac{x}{z}$.

But, $v = \frac{x}{t}$; whence, by the inverse method of fluxions,

the force of the ventricle is found $= \frac{pv}{2} \times \frac{p}{s} + \frac{x}{z} + l$. But since $z = t$, $t = \frac{q}{p}$. And hence, the force of the

ventricle $= \frac{p}{t} \times \frac{p}{s} + \frac{l}{t} + l$. After the like manner, the force of the right ventricle (noting the same things by Greek letters, which in the left are denoted by Italian ones) is

found $= \frac{q}{t} \times \frac{q}{s} + \frac{l}{t} + l$. So that the whole force of

$$\text{the heart is} = \frac{p}{t} \times \frac{p}{s} + \frac{q}{t} \times \frac{q}{s} + \frac{l}{t} + l = 2E, f$$

If now we suppose $p = 8$ ounces, and $\pi = 4$ ounces avoird. $s = 10$ square inches, and $z = 10$ as much; $l = 7$, and $a = 1\frac{1}{2}$ inches; $q = 2$ ounces avoird. $= 0.4185$ square inches, $t = 0.183$; and $t = 0.1$; the forces of the ventricles will be equal to the weights underwritten; viz.

Of the left ventricle	8	02.
Of the right ventricle	0	3

Force of the whole heart 15 4

which weights have a velocity, wherewith they would move an inch each second of a minute.

Corol. Hence it is inferred, that when the pulse is quicker than ordinary, either the resistance is less than ordinary, or the force of the heart is increased, or a less quantity of blood than usual is expelled at each contraction of the heart; and vice versa. As also, that if the resistance be either increased or diminished, either the pulse or the quantity of blood expelled at each contraction, will be either increased or diminished respectively. And that if the force of the heart be increased, or diminished, either the pulse must be accelerated, or the resistance diminished.

On these principles Dr. Jurin proceeds to demonstrate the three following theorems:

1. That the whole motion of resistance made to the blood issuing out of the heart in the systole, or the whole motion communicated to the antecedent blood, and the coats of the arteries, is equal to the whole force of the heart, quæ proxima.

2. That the motion communicated to the antecedent blood, in a systole, is to the motion communicated to the coats of the arteries, as the time of the systole is to the time of the diastole.

Whence, if, with Dr. Keil, we suppose the systole performed in one third of the interval between two pulses, the motion communicated to the antecedent blood will be one third of the whole motion of the heart; and that communicated to the arteries, two thirds.

3. In different animals, the force of the heart is in a ratio compounded of the quadruple ratio of the diameter of any homologous vessel, and the inverse ratio of the time wherein the heart is contracted; or a ratio compounded of the ratio of the weight either of the heart, or the whole animal, the triplicate ratio of the same weight, and the reciprocal ratio of the time. Phil. Trans. abstr. vol. v. p. 231. 249. &c.

We shall close this article with a table exhibiting the result of many experiments made by Dr. Hales, with a view of determining the velocity of the blood in different animals, &c. The apparatus for these experiments is very simple; it consists of a brass pipe, about one sixth of an inch in diameter, to which, by means of another brass pipe fully adapted to it, is fixed a glass tube of the same diameter, and about nine feet in length; these pipes are properly graduated, and the brass pipe is inserted into the arteries, &c. of the animals that are the subjects of the author's experiments.

The several animals.	Weight each.	Height of the blood in the artery from the ventricle.	Height of the blood in the artery from the ventricle.	Capacity of the left ventricle fixed to the heart.	Area of the orifice of the aorta.	Velocity of the blood in the aorta.	Quantity of blood in the aorta in what time.	How much weight by the artery in what time.	Weight of the blood in the artery in what time.	Number of pulsations in a minute.	Area of the transverse section of the aorta.	Area of the transverse section of the artery.
	Gr.	Oz.	Inches.	Feet inch.	Cubic inches.	Square inches.	Feet inch in 5 minutes.	Minutes.	Pounds.	Pounds.	Square inches.	Square inches.

It does not appear, that, by comparing the weights of these animals, and the several quantities of blood which pass through their hearts in a given time, any fixed rule can be thence formed for proportioning the quantities of flowing blood to their different sizes. These quantities in larger animals are very disproportionate to the bulk of their bodies. In comparison with these in lesser animals. But as the blood has a longer course, and consequently a greater resistance in the former, it appears by the table, by comparing the perpendicular heights of the blood in the tubes suited to the arteries, that the force of it in the arteries, is in the main, greatest in the largest animals. And if the blood-veins in the man and horse are equally distributed in all their homologous parts, or if they are proportionable to their respective weights, then the blood must move in them reciprocally as the times, in which quantities of blood equal to their respective weights pass through their hearts, viz. as 60 to 17 minutes; and, therefore, though the arterial blood of a horse is propelled with a greater force than that of a man, yet it moves slower in the horse, on account of a greater number of ramification, and a greater length of vessels in the larger animal. See a variety of curious experiments and observations on this subject, in Hales's Statical Essays, vol. ii.

Heart of fish. The heart in fishes is situated a little below the gills. It is usually contained in an extremely thin membrane by way of pericardium, and placed in a large cavity. The heart in the several kinds of fishes is of many different figures. 1. In some it is quadrilateral; in some it is of a triangular figure, but a little flattened, as in the cyprinid. 2. Its situation is generally transverse with respect to the head, but not always so. In the cartilaginous fishes the heart has two ventricles, as in land animals, but in all other fishes, that is, in all that have gills and not lungs, it has but one cavity. The heart in all fish has only one auricle; this is very large, and it always placed on the left side of the heart; at the place of the insertion of this auricle, there are two valves, the one an upper, the other a lower one. The auricle in its lower part contains the receptacle of the veins, and this has also, at its insertion into the auricle, two valves. The aorta, or great artery in fishes, adheres to the upper part or bulk of the heart by a ginglymus. Its first part, or that next the heart, is small, and contains two sigmoid valves. Soon after this it is dilated into a large cavity, which is whitish on the outside, and within is supported by several carnesous fibres, forming a sort of column. From this part the artery is formed into a sort of cave, and thence is carried to the gills; it gives one great branch to the hollow of each gill, that is, four to each side; and each of these large branches is again a little beyond its insertion into the hollow part of the bow of each gill, divided into four other branches, which running along the base of the lamellae, are divided finally into as many branches as there are lamellae, each receiving one of these carried to the extremity of the lamellae, and there lost; but the blood returns by as many veins, and is thence distributed throughout the whole body. In the margin of every lamina in the leaves of the branchiae, or gills, there is a vein which discharges the blood it receives from the arteries of these parts into a trunk, which runs over the surface of every arch or bow of the gills; and in fine, every vein coming from all the bowy circles of the gills, is by degrees, some higher and some lower, inserted into one common trunk. This grand trunk of the vein runs along the spine, and performs the office of the descending trunk of the aorta in land animals, and distributes the blood to every part of the body of the fish. The trunk of the lower part of each bowy circle take this course; but those of the upper part are carried up to the brain and organs of sensation, and are returned thence by other branches, which join the lower trunk. These veins when thus joined, are carried to the origin of the gills, and there are discharged into another trunk lying upon the aorta, which is opened into the receptacle of De Verney. This receptacle is no other than a venous trunk formed by the meeting of several veins coming from the spine, from the liver, and other parts, and terminating in the auricle. This is the circulation in fish carried on in a very different manner from that in land animals; and the gills serve to effect this thought of by many authors. Aristotle's Ichthyology.

Heart of insects. It is easy to discover that many insects have a true and regular heart; nor is this any where more beautifully distinguishable than in the class of flies; the small ones, and those of transparent bodies, are to be chosen indeed for this examination, the larger and more opaque being wholly improper for it. None is more eligible on this occasion than the little fly produced of the puccoon cater; this is a very pale yellowish fly of a flat body, and is perfectly transparent, that examined in a proper manner, its internal parts are seen as clearly as if they were in a white glass vessel. One of these little flies is to be taken softly by the head between the fingers; the wings are to be bent backward, and held with the head, the body inverted and held up against a strong light, and the belly then examined with the help of a magnifying glass. This examination will convince any one that flies have a real heart; they have not a long vessel only, in the place of one running lengthway down the back, as Malpighi thinks is the case in caterpillars and butterflies, but towards the middle of the second ring, and sometimes in the third, counting from the coracoid, one plainly discovers a part which can be taken for no other than a real heart. The figure of the heart in these animals varies, however, much more than in any others that we are acquainted with. Sometimes this heart is of the figure of a kidney, placed transversely, and with its hollowed part toward the coracoid, with a long vessel running straight from this hollowed part up the coracoid. At other times the hollow of the heart disappears, it lengthens itself, and acquires the figure of a bottle, with the vessel before described placed as its neck. Sometimes it is more, and sometimes less inflated and distended; sometimes the transverse diameter surpasses the longitudinal, and at others the longitudinal diameter exceeds the others. At all times, however, one may see a regular alternative contraction and distention of the heart; and to the contraction there constantly succeeds a jet of liquor thrown into the long vessel as if by a syringe; but what is very singular is, that after four or five of these jets, one always sees the liquor before thrown up, descending into the heart again out of the coracoid, by the same vessel by which it was received from the heart. Reaumur's Hist. Inf. vol. iv. p. 261.

Heart-lane, a disease, among Physicians, usually called **cardialgia**.

In furcula, or upon swallowing without due mastication; when meats are eat tough and fat, or with fuscous substances unfermented; or when by any accident the saliva is vitiated, too scanty, or not intimately mixed with the food, the fermentation becomes tumultuous, the stomach swells with air, and this extraordinary commotion being attended with an unusual heat, brings on the uneasiness called the heart-lane, which is remedied by whatever promotes a greater secretion of saliva, or helps to mix it with our aliment. Fingale's Observ. on the Diseases of the Army, p. 168. See **Dyspepsia**. The tellaceous powders, as oyster-shells, crab-eyes, chalk, &c. are the usual remedies for the heart-lane.

Heart of a tree, the middle part thereof, taken longitudinally, is called so.

Heart, in the Mangle. A horse that works in the mangle with constraint and rebellion, and cannot be brought to consent to it, is said to be a horse of *real heart*.

Heart, in Sea Language, is a peculiar sort of **dead-eye**, somewhat resembling the shape of a heart, but differing from the common dead-eyes, inasmuch as it is only furnished with one large hole in the middle, whereas the common dead-eyes have always three holes. They are principally used to contain the lambrils, by which the flays are extended.

Heart's eye, in Botany, the name of a species of violet.

It is said to be good for ruptures, and the falling sickness. **Dist. Ros.**

Heart-shell, species cardiformes, in Natural History, the name of a genus of shells, by some authors referred to the pettunculus or cockle kind, but by later writers justly distinguished into a separate genus. The characters are these: it is a bivalve shell-fish of the globose elated form, furrowed in deep lines, and in some species imbricated, in others plicately, never auricular, and always expressing what we call the figure of a heart.

There are several very remarkable species of this genus. The imbricated heart-shell, called by the French authors *fauxz*, or rock-shell, from its resembling the rafters on the top of a house, is a very elegant one. Another species is called the cabbage-shell, from the undulations in its resembling some of the garden-curbed cabbages. To this genus also belong the Nook's ark shell. Some of these species of heart-shells are of a globular figure; others of a triangular shape; others more nearly of the shape of a human heart; and others again of an imbricated kind. Hist. Nat. Eclairc. p. 330.

HEARTH, foun. See FIRE, CHIMNEY, &c.

HEARTH-money. See CHIMNEY-money.

HEARTH-stone. See FIRE-stone.

HEAT, calor, one of the primary qualities of bodies; opposed to cold.

Heat may be defined a physical being, whose presence is known, and its degree measured by the expansion of the air, or spirit, or mercury, in the thermometer.

Heat in us is properly a sensation, excited by the action of fire: or it is the effect of fire on our organs of feeling.

Hence it follows, that what we call *heat* is a particular idea, or modification of our own mind; and not any thing existing in that form in the body that occasions it. *Heat* is no more in the fire that burns the finger, than pain in the needle that pricks it. In effect, *heat*, in the body that gives it, is only motion; and in the mind only a particular idea or disposition of the soul.

Heat, with respect to our sensation, or the effect produced on us by a hot body is eliminated by its relation to the organ of feeling; no object appearing to be hot, unless its *heat* exceeds that of our body: whence the same thing to different persons, or at different times to the same person, shall appear both hot and cold.

Heat, as it exists in the hot body, or that which constitutes and denominates a body hot, and enables it to produce such effects on our organ, is variously considered by the philosophers. Some will have it a quality, others a substance, and others only a mechanical affection, viz. motion.

Aristotle and the Peripatetics, define *heat* a quality or accident whereby homogeneous things, i. e. things of the same nature and kind, are collected and gathered together; and heterogeneous ones, or things of different natures, are severed or diffused. Thus, says he, the same *heat* which associates and brings into a mass several particles of gold before separate, separates the particles of two metals before mixed together. But not only the doctrine, but the very instance he produces, is faulty; for *heat* though continued to eternity, will never separate a mass, e. g. of gold, silver, and copper; and on the contrary, if bodies of different qualities, as gold, silver, and copper, be put separately in a vessel over a fire; notwithstanding all their heterogeneity, they will be mixed and congregated into a mass thereby.

In effect, *heat* cannot be said to do either this thing or that universally; but all its effects depend on the circumstances of its application. Thus, to do the same thing in different bodies, different degrees of *heat* are required; as, to mix gold and silver, the *heat* must be in one degree, and to mix mercury and sulphur, in another.

Add, that the same degree of *heat* shall have opposite effects. Thus a vehement fire shall render water, oils, salts, &c. volatile; and yet the same fire shall embody sand, and fixed alkaline salt, into glass.

The Epicureans, and other corporealians, define *heat* not as an accident of fire, but as an essential power or property thereof, the same in reality with it, and only distinguished from it in the manner of our conception. *Heat*, then, on their principles, is no other than the volatile substance of fire itself, reduced into atoms, and emitted in a continual stream from ignited bodies; so as not only to warm the objects within its reach, but also, if they be inflammable, to kindle them, turn them into fire, and conspire with them to make flame.

In effect, these corporealians, say they, flying off from the ignited body, while yet contained within the sphere of its flame, by their motion constitute fire; but when fled, or got beyond the flame, and dispersed every way, so as to escape the apprehension of the eye, and only to be perceivable by the feeling, they take the denomination of *heat*, inasmuch as they still excite in us that sensation. The Cartesian, improving on this doctrine, ascribes *heat* to consist in a certain motion of the insensible particles of a body, resembling the motion whereby the several parts of our body are agitated by the motion of the heart and blood.

Our latest and best writers of mechanical, experimental, and chemical philosophy, differ very considerably about *heat*. The fundamental difference is, whether it be a peculiar property of one certain immutable body, called *fire*; or whether it may be produced mechanically in other bodies, by inducing an alteration in the particles thereof. The former tenet, which is as ancient as Democritus, and the system of atoms, had given way to that of the Cartesians, and other mechanists; but is now with great address retrieved, and improved on, by some of the latest writers, particularly Homburg, the younger Lemery, Gravesande, and, above all, by the learned and industrious Boerhaave, in a course of lectures expressly on *fire*; the result whereof we have already laid down under the article *FIRE*.

The thing we call *fire*, according to this author, is a body of genera, created such ab origine, unalterable in its nature and properties, and not either producible de novo, from any other body, nor capable of being reduced into any other body, or of ceasing to be fire.

This fire, he contends, is diffused equally every where, Vol. II. No. 167.

and exists alike, or in equal quantity, in all parts of space, whether void or possessed by bodies; but that naturally, and in itself, it is perfectly latent and imperceptible; and is only discovered by certain effects which it produces, and which are cognizable by our senses.

These effects are *heat*, light, colour, rarefaction, and burning, which are all indications of *fire*, as being none of them producible by any other cause: so that whenever we observe any of these, we may safely infer the action and presence of *fire*. But, though the effect cannot be without the cause, yet the fire may remain without any of these effects; any, we mean, gross enough to affect our senses, or become objects thereof: and this he adds, is the ordinary case, there being a concurrence of other circumstances, which are often wanting, necessary to the production of such sensible effects.

Hence, particularly, it is, that we sometimes find several, and sometimes all, of these effects of *fire* together, and sometimes one unaccompanied with any others; according as the circumstances favour or dispoise things for the same. Thus we find light without *heat*; as in rotten wood, putrid fishes, or the mercurial phosphorus; may, and one of them may be in the highest degree, and the other not sensible; as in the focus of a large burning-glass exposed to the moon; where, though the light, as Dr. Hooke found, was sufficient to have infinitely blinded the best eye, yet no *heat* was perceivable, nor was there the least rarefaction occasioned in an exquisite thermometer. See MOON and LIGHT.

On the other hand, there may be *heat* without light, as we find in fluids, which emit no light even when they boil, and not only *heat* and rarely, but also burn or consume the parts; and in metals, stones, &c. which contract a vehement *heat* before they shine, or become ignited. Nay, and there may be the most intense *heat* in nature, without any light: thus in the focus of a large burning concave, where metals melt, and the hardest gems vitrify, the eyes perceive no light; so that should the hand happen to be put there, it would instantly be turned into a coal, or even a calx. So also rarefactions are frequently observed by the thermometer, in the night-time, without either *heat* or light, &c.

But as *heat*, when accumulated in a sufficient quantity, is constantly accompanied with light, or, in other words, as *fire* is always produced by the increase of *heat*, philosophers have generally considered these phenomena as proceeding from the same cause; and have, therefore, used the word *FIRE* to express that unknown principle, which, when it is present to a certain degree, excites the sensation of *heat* alone, but when accumulated to a greater degree, renders itself obvious, both to the sight and touch, or produces *heat*, accompanied with light; and in this sense, the element of *fire* signifies the same thing with absolute *heat*. See the sequel of this article.

Thus it appears, that the effects of *fire* have a dependence on other concurring circumstances; some more, and others less. One thing seems to be required in common to them all, viz. that the *fire* be collected or brought into less compacts; without this, as *fire* is every where equally diffused, it could have no more effect in one place than another, but must either be disposed to warm, burn, and shine, every where, or no where. Indeed, such every where does amount to no where; for to have the same *heat*, &c. in every place, would be to have no *heat* at all; it is only the changes that we perceive, those alone make the mind distinguish its state, and become conscious of the things that diversify it. So our bodies being equally pressed on all sides by the ambient air, we feel no pressure at all; but if the pressure be only taken off in any one part, as by laying the hand over an exhausted receiver, we soon become sensible of the load.

This collection is performed two ways: the first, by directing and determining the fluctuating corpules of *fire* into lines, or trains, called *rays*; and thus driving infinite successions of the fiery atoms upon the same place or body, each to produce its several effect, and second that of the preceding ones, till by a series of augmentations, the effect is sensible. This is the office of those bodies which we call *luminaries*; such as the sun, and other heavenly bodies; and also of our culinary fires, lamps, &c. on earth, which do not emit the *fire* from their own substance, as is commonly conceived, but only by their rotatory mutation direct the undetermined corpules into parallel rays. And the effect may still be farther increased by a second collection of these parallel into converging rays, by means of a concave speculum, or a convex glass, which at length brings them all into point: whence those astonishing effects of our large burning-glasses.

The second way wherein the collection is made, is not by determining the vague *fire*, or giving it any new direction, but merely by assembling it; which is done by attraction

attrition or rubbing of two bodies swiftly against each other; or, in effect, as that nothing in the air, except the floating fire, has activity enough to move an equal pace, or succeed fast enough into the places continually relinquished by it: by which means fire, the most agile body in nature, slipping in, becomes collected in the path of the moving body; so that the moveable has, as it were, a fiery atmosphere around it. Thus it is, that the axes of chariot-wheels, mill-stones, the ropes of ships, cannon-bills, &c. conceive heat, and some of them kindle into flame.

Thus much for the circumstance in heat, common to all the effects of fire, viz. collection. The particular circumstances are various: thus, for it to warm, or to heat, i. e. to give the sensation of it, it is necessary that there be more fire in the hot body or thing, than in the organ whereby it is to be felt; otherwise the mind will not be put into any new state upon its approach, nor have any new idea. Whence, also, if the contrary to this obtains, v. g. if there be less fire in the external object than in the organ, it will raise an idea of cold, or chilliness.

This it is, that a man coming out of a hot bath into a moderately warm air, seems as if he were got into an excessive cold place; and another entering a room scarcely warm, in a very pinching day, will at first fancy himself in a dove. Whence it appears, that the sense of heat does by no means determine the degree of fire; the heat being only the ratio or difference between the internal and external fire. As to the circumstances necessary to the fire's producing LIGHT, BURNING, KARSIFICATION, &c. see LICHY, &c.

The mechanical philosophers, particularly lord Bacon, Mr. Boyle, and sir Isaac Newton, look on heat in another light. They do not conceive it as an original inherent property of any particular sort of body; but as mechanically producible in any body.

Lord Bacon, in an *expres* tract De Forma Calidi, deduces, from a particular enumeration of the several phenomena and effects of heat,

1. That heat is motion: not that motion generates heat, or heat motion; though, in many cases, this be true: but that the very thing heat is motion and nothing else. But this motion, he shews, has several peculiar circumstances, which constitute it heat.

As, 2. That it is an expansive motion, whereby a body endeavours to dilate or stretch into a larger dimension than it had before.

3. That this expansive motion is directed towards the circumference, and at the same time upwards; which appears hence, that an iron rod, being erected in the fire, will burn the hand that holds it, much sooner than if put in laterally.

4. That this expansive motion is not equable, and of the whole, but only of the smaller particles of the body; as appears from the alternate tepidation of the particles of hot liquors, ignited iron, &c. And lastly, that this motion is very rapid.

Hence he defines heat an expansive undulatory motion in the minute particles of the body; whereby they tend, with some rapidity, towards the circumference; and at the same time incline a little upwards.

Hence, again, he adds, that if, in any natural body you can excite a motion whereby it shall expand or dilate itself, and can so repress and direct this motion upon itself, as that the dilatation shall not proceed uniformly, but obtain in some parts, and be checked in others, you will generate heat. This doctrine, Descartes and his sect adhere to with some little variation. According to them, heat consists in a certain motion or agitation of the parts of a body, like to that wherewith the several parts of our body are agitated by the motion of the heart and blood.

Mr. Boyle, in a treatise of the Mechanical Origin of Heat and Cold, strenuously supports the doctrine of the producibility of heat, with new observations and experiments: as a specimen, we shall here give one or two.

In the production, says he, of heat, there appears nothing, on the part either of the agent or patient, but motion, and its natural effects. When a smith briskly hammers a small piece of iron, the metal thereby becomes exceedingly hot; yet there is nothing to make it so, except the forcible motion of the hammer impressing a vehement and variously determined agitation on the small parts of the iron, which, being a cold body before, grows, by that superinduced commotion of its small parts, hot: first in a more loose acceptance of the word, with regard to some other bodies, compared with which it was cold before; and then sensibly hot, because this agitation surpasses that of the parts of our fingers; and in this instance oftentimes, the hammer and the anvil continue cold after the operation; which shews, that the heat acquired by the iron, was not communicated by either of those implements as heat, but produced in it by

motion great enough strongly to agitate the parts of so small a body as the piece of iron, without being able to have the like effect upon so much greater masses of metal, as the hammer and the anvil; though, if the percussions were often and briskly renewed, and the hammer were small, this also might be heated. Whence it is not necessary, that a body itself should be hot to give heat.

If a large nail be driven by a hammer into a plank of wood, it will receive several strokes on its head, before it grow hot; but when it is once driven to the head, a few strokes suffice to give it a considerable heat: for while at every blow of the hammer, the nail enters farther into the wood, the motion produced is chiefly progressive, and is of the whole nail tending one way; but when the motion ceases, the impulse given by the stroke being unable to drive the nail farther on, or to break it, must be spent in making various, vehement, and intestine commotions of the parts among themselves, wherein the nature of heat consists.

That heat, say the same authors, is mechanically producible, appears probable from a consideration of its nature, which seems principally to consist in that mechanical property of matter, called motion; but which is here subject to three conditions, or modifications.

First, the agitation of the parts of the body must be vehement: for this distinguishes the bodies said to be hot, from those which are barely fluid. Thus, the particles of water, in its natural state, move so calmly, that we do not feel it at all warm, though it could not be a liquor, unless they were in a restless motion; but when water becomes actually hot, the motion manifestly and proportionally appears vehement, since it does not only strike our organs of feeling briskly, but ordinarily produces numerous very small bubbles, melts coagulated oil cast upon it, and affords vapours, which by their agitation ascend into the air. And if the degree of heat be such as to make the water boil, the agitation becomes more manifest by the confused motions, waves, noise, bubbles, and other obvious effects, excited therein. Thus in a heated iron, the vehement agitation of its parts may be easily inferred from the motion, and the hissing noise, it makes with the drops of water that fall from it. But though the agitation be various, as well as vehement, yet there is a third condition required to make a body hot; which is, that the agitated particles, or at least the greatest number of them, be so minute, as to be singly insensible. Were a heap of sand to be vehemently agitated by a whirlwind, the bulk of the corporeals would keep their agitation from being properly heated, though by their numerous strokes upon any man's face, and the brisk commotion of the spirits, which would thence ensue, they might perhaps produce that quality.

The second condition is, that the determination be very various, and tend all manner of ways. This variety of determinations appears to be in hot bodies, both by some of the instances already mentioned, and especially that of flame, which is a body: by the dilatation of metals when melted; and by the operations of heat, exercised by hot bodies upon others, in what posture or situation soever the body, to be heated thereby, be applied to them: thus a coal, thoroughly kindled, will appear on all sides red, and melt wax and kindle brimstone, whether the body be applied to the upper, the lower, or any other part of it. Hence, if we duly attend to this notion of the nature of heat, it is easy to discern how it may be mechanically produced several ways: for, except in some few anomalous cases, by whatever means the insensible parts of a body can be put into a very confused and vehement agitation, heat will be introduced into that body; and as there are several agents and operations, by which the heating motion may be excited, so there must be several mechanical ways of producing heat: various experiments may be reduced to almost each of these heads; chance itself having, in the laboratories of chemists, afforded several phenomena referable thereto.

This system is further supported also by sir Isaac Newton, who does not conceive fire as any particular species of body, originally endued with such and such properties. Fire, according to him, is only a body much ignited; i. e. heated hot, so as to emit light copiously: what else, says he, is red-hot-iron than fire? and what else is a burning coal than red-hot wood? or flame itself than red-hot smoke? It is certain, that flame is only the volatile part of the fuel heated red-hot, i. e. so hot as to flame; and hence only such bodies as are volatile, i. e. such as emit a copious fume, will flame; nor will they flame longer than they have fume to burn. In diffusing hot spirits, if the head of the still be taken off, the ascending vapours will catch fire from a candle, and turn into a flame. And in the same manner several bodies, much heated by motion, attrition, fermentation, or the like,

like, will emit lucid flames, which if they be copious enough, and the *heat* sufficiently great, will be flame: and the reason why fused metals do not flame, is the smallness of their fumes; this is evident, because sulphur, which fumes most copiously, does likewise flame. Add, that all flaming bodies, as oil, tallow, wax, and pitch, sulphur, &c. by flaming, waste, and vanish into burning smoke.

And do not all fixed bodies, when heated beyond a certain degree, emit light, and shine? and is not this emission performed by the vibrating motion of their parts? and do not all bodies, which abound with terrestrial and sulphureous parts, emit light as often as those parts are sufficiently agitated, whether that agitation be made by external fire, or by friction, or percussion, or putrefaction, or by any other cause? Thus sea-water, in a storm; quicksilver agitated in vacuo; the back of a cat, or the neck of a horse, obliquely rubbed in a dark place; wood, flesh, and fish, while they putrefy; vapours from putrefying waters, usually called *ignis fatuus*; stacks of moist hay or corn; glow-worms; amber and diamonds by rubbing; fragments of flint struck off with a flint, &c. all emit light. Are not gross bodies and light convertible into one another? and may not bodies receive much of their activity from the particles of light which enter their composition? I know no body left apt to shine than water; and yet water, by frequent distillations, changes into fixed earth, which, by a sufficient *heat*, may be brought to shine like other bodies.

Add, that the sun and stars, according to Sir Isaac Newton's conjecture, are no other than great earths vehemently heated: for large bodies, he observes, preserve their *heat* the longest, their parts heating one another; and why may not great, dense, and fixed bodies, when heated beyond a certain degree, emit light so copiously, as by the emission and reaction thereof, and the reflections and refractions of the rays within the pores, to grow still hotter, till they arrive at such a period of *heat* as is that of the sun? Their parts also may be farther preserved from fuming away, not only by their fixity, but by the vast weight and density of their atmospheres incumbent on them, and strongly compelling them, and condensing the vapours and exhalations arising from them. Thus we see, warm water, in an exhausted receiver, shall boil as vehemently as the hottest water open to the air; the weight of the incumbent atmosphere, in this latter case, keeping down the vapours, and hindering the ebullition, till it has conceived its utmost degree of *heat*. So, also, a mixture of tin and lead, put on a red-hot iron in vacuo, emits a fume and flame; but the same mixture in the open air, by reason of the incumbent atmosphere, does not emit the least sensible flame. Thus much for the *system of the productivity of heat*.

On the other hand, Mr. Homberg, in his *Essai du Souffle Principe*, holds, that the chemical principle or element *volatile*, which is supposed one of the simple, primary, pre-existent ingredients of all natural bodies, is real fire, and consequently, that fire is coeval with body. Mem. de l'Acad. an. 1705.

Dr. s'Graveande goes on much on the same principle: fire, according to him, enters the composition of all bodies, is contained in all bodies, and may be separated or procured from all bodies, by rubbing them against each other, and thus putting their fire in motion. But fire, he adds, is by no means generated by such motion. Elem. Physic. tom. ii. cap. 1.

A body is then only sensibly hot, when the degree of its *heat* exceeds that of our organs of sense; so that there may be a lucid body, without any sensible *heat*; and consequently, as *heat* is only a sensible quality, without any *heat* at all.

Heat, in the hot body, says the same author, is an agitation of the parts of the body, made by means of the fire contained in it: by such agitation a motion is produced in our bodies, which excites the idea of *heat* in our minds: so that *heat*, in respect of us, is nothing but that idea, and in the hot body nothing but motion. If such motion expel the fire in right lines, it may give us the idea of light; if in a various and irregular motion, only of *heat*.

Mr. Lemery, the younger, agrees with these two authors in asserting this absolute and ingenerable nature of fire; but he extends it farther. Not contented to confine it to an element to bodies, he endeavours to shew, that it is equally diffused through all space; that it is present in all places, even in the void spaces between the bodies, as well as in the insensible interstices between their parts. Mem. de l'Acad. an. 1713. See *Æther*.

This last sentiment falls in with that of Boerhaave above delivered. It seems extravagant to talk of heating cold liquors with ice; yet Mr. Boyle assures us he has easily done it, by taking out of a balon of cold water, wherein

several fragments of ice were swimming, one piece or two which he perceived very well drenched with the liquor, and suddenly immersing them into a wide-mouthed glass of strong oil of vitriol; for the menstruum presently mixing with the water which adhered to the ice, produced in it a brisk *heat*, sometimes with a manifest smoke, and that suddenly dissolving the contiguous parts of the ice, and those the next, the whole ice was soon reduced to water; and the corrosive menstruum being, by two or three shakes, well dispersed through it, the whole mixture would immediately grow to hot, that sometimes the containing phial could not be endured in one's hand. Philosophers have lately distinguished *heat* into *absolute* and *sensible*. By *absolute heat*, which is synonymous with what other writers have called *calor*, they mean that power or element, which, when it is present to a certain degree, excites in animals the sensation of *heat*; and by *sensible heat*, the same power considered in its relation to the effects which it produces: e. g. two bodies are said to have equal quantities of *sensible heat*, when they produce equal effects upon the mercury in the thermometer; but as bodies of different kinds have different capacities for containing *heat*, the *absolute heat* in such bodies will be different, though the *sensible heat* be the same. Thus, a pound of water and a pound of antimony of the same temperature have equal *sensible heat*; but the former contains a much greater quantity of *absolute heat* than the latter. It is a well known fact, that *heat* is contained in great quantities in all bodies, when at the common temperature of the atmosphere; and it is no less certain, that *heat* has a constant tendency to diffuse itself over all bodies, till they are brought to the same degree of *absolute heat*: it is also generally acknowledged, that, when the parts of the same homogeneous body have the same degree of *sensible heat*, the quantities of *absolute heat* will be proportionable to the bulk or quantity of matter: it also appears, that in the same homogeneous bodies, if the temperatures be different, but the quantities of matter the same, the quantities of *absolute heat* will be in proportion to the temperatures; and, therefore, the mercurial thermometer is an accurate measure of the comparative quantities of *absolute heat*, which are communicated to the same homogeneous bodies, or separated from them, as long as such bodies continue in the same form.

M. De Luc has evinced by a variety of experiments, that the expansions of mercury between the freezing and boiling points of water correspond precisely to the quantities of *absolute heat* applied, and that its contractions are proportionable to the diminution of this element within these limits: from hence it may also be inferred, that, if the mercury were to retain its fluid form, its contractions would be proportionable to the decrements of the *absolute heat*, though the diminution were continued to the point of total privation. But the comparative quantities of *absolute heat*, which are communicated to different bodies, or separated from them, cannot be determined in a direct manner by the thermometer.

Some philosophers have apprehended that the quantities of *absolute heat* in bodies are in proportion to their densities. The celebrated Boerhaave imagined that *heat* is equally diffused through all bodies, the denser as well as the rarer; and, therefore, that the quantities of *heat* in bodies, are in proportion to their bulk; and at his desire, Fahrenheit attempted to determine the fact by experiment. For this purpose, he took equal quantities of the same fluid, and gave them different degrees of *heat*, and, having mixed them intimately together, found, that the temperature of the mixture was half the excess of the hotter above the colder. But if this experiment be made with water and mercury, in the same circumstances, the result will be different. Thus, if you take equal bulks of mercury and water, and give the water a greater degree of *heat* than the mercury, the *heat* of the mixture will always be greater than half the excess of the *heat* of the water above that of the mercury. If, on the other hand, the mercury be hotter than the water, the temperature of the mixture will always be less than half the excess of the *heat* of the mercury above that of the water. And, in general, if equal bulks of water and mercury, at different temperatures, be mixed together, the change, produced in the *heat* of the mercury, will be to that produced in the *heat* of the water as three to two; from whence it has been inferred, that the comparative quantities of the *absolute heat* of these fluids are reciprocally proportionable to the changes which are produced in their *sensible heat*, when they are mixed together at different temperatures: this is a fact, which has been publicly taught, for several years, by Dr. Black and Dr. Irvine, in the universities of Edinburgh and Glasgow. This rule, however, does not apply to those substances

substances which, in mixture, excite sensible heat by chemical action.

From the experiments and reasoning employed by Dr. Crawford, a late ingenious and much-approved writer on this subject, it follows, that equal weights of heterogeneous substances, as air and water, having the same temperature, may contain unequal quantities of absolute heat; and, therefore, there must be certain essential differences in the nature of bodies, in consequence of which some have greater powers or capacities of collecting and containing heat than others. On these principles Dr. Crawford proceeds, with great caution, guarding as he apprehends, against every possible cause of error, to estimate the absolute heat of a variety of substances: the general conclusions deduced from his experiments, the reader will find in this and some of the following articles.

We shall now observe, that he has shown, by several well-constructed experiments, that the capacities of bodies for containing heat are diminished by the addition of phlogiston, and increased by the separation of this principle.

It has been an opinion generally received among philosophers, that phlogiston is either fire itself, or intimately connected with the production of fire. But if this were true, says Dr. Crawford, bodies when united with phlogiston, would contain a greater quantity of fire, or of absolute heat, than when separated from it: thus metals would contain more absolute heat than their calces, and sulphur more than the vitriolic acid. But the contrary is evinced to be the fact: e. g. the absolute heat of the calx of tin is to that of tin as 14.7 to 10.4; the absolute heat of the calx of iron is to that of the metal as 8 to 5.1; the absolute heat of the calx of lead is to that of lead as 19.0 to 14.7; and the absolute heat of the calx of antimony is to that of the regulus as 11.6 to 4.5. Hence it follows, that if phlogiston be added to a body, a quantity of the absolute heat of that body will be extricated; and if the phlogiston be separated again, an equal quantity of heat will be absorbed: in the former case, the capacity of the body for containing heat is diminished, and in the latter increased. Heat, therefore, and phlogiston appear to be two opposite principles in nature: by the action of heat on bodies, the force of their attraction to phlogiston is diminished; and by the action of phlogiston, a part of the absolute heat, which exists in all bodies as an elementary principle, is expelled. It appears, however, from the facts above recited, that, though all bodies have their capacities for containing heat changed in consequence of the addition or separation of phlogiston, yet the degree of this change is very different in different bodies. It is also evident from this ingenious author's experiments, that different quantities of phlogiston are required to saturate different bodies; and that when phlogiston passes from one body to another, the changes in the capacities of the bodies for containing heat will be different, and unequal quantities of matter will be changed in a given time: and if two contiguous bodies, at the same moment, have their capacities for containing heat respectively increased and diminished, and the changes be such that the whole heat separated from the one is absorbed by the other, no sensible heat or cold will be produced. Dr. Crawford has demonstrated by an analytical process, that in the case when this happens, the differences of the capacities are reciprocally as the quantities of matter changed in a given time: but if the diminution in the capacity of one body be to the increase in another, in a greater proportion than the quantity of matter in this body to that in the former, the whole of the heat which is separated from the former will not be absorbed by the latter: a part of it becoming redundant, or being converted into moving and sensible heat. He observes, that the capacity for containing heat may continue unchanged, while the absolute heat is varied without end; that the alterations which are produced in the sensible heats in different bodies, by given quantities of absolute heat, are greater or less, as the body to which the heat is applied has a less or greater capacity for containing heat; and, therefore, the sensible heat of a body depends partly upon the quantity of its absolute heat, and partly upon the nature of the body in which this heat is contained; and therefore in the same body, the sensible heat may vary, though the absolute heat continues the same. The curious reader will find a variety of other proportions, that obtain with respect to the capacities, the sensible heats, and the quantities of absolute heat, deduced from experiment and analysis, in the work cited at the close of this article.

This ingenious writer has not presumed absolutely to decide the question that has been long agitated, whether heat be a substance or a quality. He observes, however, that if we adopt the opinion, that heat is a distinct substance, an element *sui generis*, the phenomena will be

found to admit of a simple and obvious interpretation; and to be perfectly agreeable to the analogy of nature. Fire, he says, on this hypothesis, will be considered as an elementary principle, which enters into the composition of all known bodies: in consequence of the addition of phlogiston, a portion of the fire will be detached, in the same manner as the nitrous acid is detached, by the vitriolic, from an earth or alkali; and therefore respiration and combustion will be truly chemical processes, in which, by the exchange of fire and phlogiston, a double decomposition will take place, and two new compounds will be formed: the blood, or the inflammable body, parting with phlogiston and receiving fire, and the atmospheric air parting with fire and receiving phlogiston. See *Animal HEAT*, and *HEAT of inflammable bodies*.

He adds, that a table may be formed on this supposition, exhibiting the respective attractions of phlogiston and fire. As phlogiston separates from bodies a part of their absolute heat, this should be placed at the head of the first column; the caloric of the perfect metals, which attract this principle with the greatest force, should stand immediately under phlogiston; and next to these should be classed in order, dephlogisticated and atmospheric air, the bases of all the inflammable bodies, according to the degrees of heat which are necessary to their inflammation, when combined with phlogiston, and last of all nitrous air. Fire should be placed at the head of the second column; and if the attractions of bodies to this principle be proportionable to the quantities of it contained in them, when the quantities of matter are equal, under fire should stand dephlogisticated and atmospheric air, the vapour of the nitrous acid, and probably of some other fluid, arterial blood, watery, &c. But many experiments are wanting for forming an accurate table of this kind. See Crawford's *Experiments and Observations on Animal Heat and the Inflammation of combustible Bodies*, &c. 8vo. 1779. See also Ellis's *Philosophical Observations*, &c. 8vo. 1780.

There is a great variety in the heat of different places and seasons. Naturalists commonly lay it down, that the nearer any place is to the centre of the earth, the hotter it is found; but this does not hold strictly true. In digging mines, wells, &c. they find, that at a little depth below the surface it feels cool; a little lower, and it is yet colder, as being now beyond any reach or influence of the sun's rays, inasmuch that water will freeze almost instantaneously; and hence the use of ice-houses, &c. but when a little lower, viz. about forty or fifty feet deep, it begins to grow warmer; so that no ice can bear it; thus, in the cave of the observatory at Paris, about ninety feet under ground, the heat keeps the thermometer at 53°; and then the deeper they go, still the greater is the heat, till, at length, respiration grows difficult, and the candles go out. Hence some have recourse to the notion of a fund of fire lodged in the centre of the earth, which they consider as a central fun, and the great principle of the generation, vegetation, nutrition, &c. of fustil and vegetable bodies.

But Mr. Boyle, who had been at the bottom of some mines himself, suspects that this degree of heat, at least in some of them, may arise from the peculiar nature of the minerals generated therein. To confirm this he instances a mineral of the vitriolic kind, dug up in large quantities, in several parts of England, which, by the bare effusion of common water, will grow so hot as almost to take fire.

On the other hand, as you ascend high mountains, the air grows more and more piercing and cold: thus the tops of the Pico de Thierie in Bohemia, the pike of Teneriff, and several others, even in the most sultry countries, are found always invested with snow and ice, the heat never being sufficient to thaw the same.

In some of the mountains of Peru there is no such thing as running water, but all ice: plants make a shift to grow about the feet of the mountains, but near the top no vegetable can live; and this is not for want of food, but through the intensity of the cold. This effect is attributed to the thinness of the air, and the little surface of earth there is to reflect the rays. The rays here are only determined into a parallelism; but the effect of direct parallel rays is found, by computation, to be very inconsiderable, this effect being really greater in winter than summer.

HEAT, in Geography. The diversity of the heat of climes and seasons arises from the different angles under which the sun's rays strike upon the earth's surface.

It is shown in mechanics, that a moving body, striking perpendicularly on another, acts on it with all its force; and that a body striking obliquely, acts with the less force, the more it deviates from the perpendicular. Now fire moving in right lines, must observe the same mechanical

law as other bodies; and consequently its action must be measured by the sine of the angle of incidence; and hence fire, striking on any obstacle in a direction parallel thereto, has no sensible effect, because the ratio is almost infinite, i. e. it is nothing. Accordingly, the sun, radiating on the earth in the morning, scarce produces any warmth at all.

Hence Dr. Halley gives a mathematical computation of the effect of the sun under different seasons and climates; proceeding on this principle, that the simple action of the sun, as all other impulses or strokes, is more or less forcible, according to the sines of the angles of incidence, or to the perpendiculars let fall on the plane; whence, the vertical ray (which is of the greatest heat) being put for radius, the force of the sun on the horizontal surface of the earth will be to that, as the sines of the sun's altitude at any other time.

Hence it follows, that the time of the continuance of the sun's shining being taken for a basis, and the sines of the sun's altitude erected thereon as perpendiculars, and a curve drawn through the extremities of those perpendiculars, the area comprehended will be proportionate to the collection of the heat of all the sun's beams in that space of time.

Hence it will follow likewise, that under the pole the collection of all the heat of a tropical day is proportionate to a rectangle of the sine of 23 degrees and a half into 24 hours, or the circumference of a circle; that is, the sine of 23 degrees and a half being nearly $\frac{4}{5}$ of radius, as $\frac{3}{5}$ into 12 hours. Or, the polar heat is equal to that of the sun continuing 12 hours above the horizon at 53 degrees height; than which the sun is not five hours more elevated under the equinoctial.

But whereas the nature of heat is to remain in the subject, after the luminary that occasioned its being heated is removed, and particularly in the air, under the equinoctial the twelve hours absence of the sun does but little diminish the motion impressed by the past action of his ray, wherein heat consists, before he rises again; but under the pole, the long absence of the sun for six months, wherein the extremity of cold does obtain, hath so chilled the air, that it is, as it were, frozen, and cannot, before the sun has got far towards it, be any ways sensible of his presence, his beams being obstructed by thick clouds, and perpetual fogs and mists.

That heat and cold very much depend on the clearness or opacity of the sky, is attested by fact; for the winter cold in South America is very sharp, because the atmosphere is loaded with clouds and icy particles, which intercept the solar rays. At Lima, in lat. 12° south, where the sky is never free from vapours, the heat is moderate, but at the distance of a few miles the sky is more serene, and there the heat is greater; and at Cartagena, in lat. 11° north, the heat is, principally on this account, intolerable. Add, that the different degrees of heat and cold, in different places, depend, in a very great measure, upon the accidents of situation, with regard to mountains or valleys, rivers, seas, and woods, and the nature and colour of the soil, &c. The first, especially when they are lofty and covered with snow, greatly help to chill the air by the winds which come over them, and which blow in eddies through the levels beyond.

Mountains, sometimes, turning a concave side towards the sun, have the effect of a burning mirror, on the subject plain; and the like effect is sometimes had from the concave, or convex parts of clouds, either by refraction or reflection. And some even take these to be sufficient to kindle the exhalations lodged in the air, and to produce thunder and lightning, &c.

As to soils; a stony, sandy, or chalky earth, it is known, reflects most of the rays into the air again, and retains but few; by which means a considerable accession of heat is derived to the air; as, on the contrary, black loose soils absorb most of the rays, and return few into the air, so that the ground is much the hotter.

This the peasants, who inhabit the morafs de Veenen, where turf is dug, are very sensible of; walking there but a little while, the feet grow extremely hot, but the face not at all; on the contrary, in a sandy place, the feet are scarce warm, when the face is scorched by the great reflection.

It is certain, that heat communicated by the sun to bodies on this earth, depends much upon other circumstances beside the direct force of its rays. These must be modified by our atmosphere, and variously reflected and combined by the action of the surface of the earth itself, to produce any remarkable effects of heat; so that if it were not for these additional circumstances, it is much to be questioned whether the naked heat of the sun would be very sensible.

To this purpose, it is observed by Ulloa, in his Voyage to Peru, that on the western shore of that kingdom, Vol. II. N° 167.

from Santa Maria de la Parilla to Lima, it is winter on the mountains from January or February to June, whilst it is summer in the valleys; but from June to November or December, it is winter in the valleys, and summer in the mountains.

The following table gives the heat to every tenth degree of latitude in the equinoctial and tropical fun, by which an estimate may be made of the intermediate degrees.

Lat.	Sun in T. ☉	Sun in ☿	Sun in ♊
0	20000	18341	18341
10	19596	20290	18834
20	18754	21737	19166
30	17311	22651	19124
40	15711	23048	19444
50	12815	22991	19798
60	10000	22773	19753
70	6840	22543	0000
80	3473	21673	0000
90	0000	20555	0000

For an account of the general principles and problem, by which this table is calculated, see Phil. Trans. abstr. vol. II. p. 167, &c.

From this table are deducible the following corollaries:

1. That the equinoctial heat, when the sun becomes vertical, is as twice the square of the radius; which may be proposed as a standard to be compared with in all other cases.

2. That under the equinoctial the heat is as the sine of the sun's declination.

3. That in the frigid zones, when the sun sets not, the heat is as the circumference of a circle into the sine of the altitude at 6. And, consequently, that in the same latitude, these aggregates of warmth are as the sines of the sun's declination; and, at the same declination of the sun, they are as the sines of the latitudes, and generally they are as the sines of the latitudes into the sines of declination.

4. That the equinoctial day's heat is every-where as the cosine of the latitude.

5. In all places where the sun sets, the difference between the summer and winter heat, when the declinations are contrary, is equal to a circle into the sine of the altitude at 6, in the summer parallel; and, consequently, those differences are as the sines of the latitude into, or multiplied by, the sines of declination.

6. From the foregoing table it appears, that the tropical fun, under the equinoctial, has of all others the least force; under the pole it is greater than any day's heat whatever, being to that of the equinoctial as 5 to 4.

From the table, and these corollaries, a general idea may be conceived of the sum of all the actions of the sun in the whole year; and thus that part of heat which ariseth simply from the presence of the sun, may be brought to a geometrical certainty. The heat of the sun, for any small portion of time, is always as a rectangle, contained under the sine of the angle of incidence of the ray producing heat at that time.

Many objections have been urged against the preceding theory of Dr. Halley; some have urged, that the effect of the sun's heat is not in the simple ratio of the sines of the angles of incidence, but in the duplicate ratio of these sines; alleging, that this is the law of the impulse of fluids. See FOUNT. Dr. Halley himself was well apprised, that many other circumstances, besides the direct force of the sun's rays, contributed to augment or diminish the effect of this and the heat resulting from it in different climates; and, therefore, no calculation, formed on the preceding theory, can be supposed to correspond exactly with observation and experiment. It has also been objected, that, according to the preceding theory, the greatest heat in the same place should be at the summer solstice, and the most extreme cold at the winter solstice; which is contrary to experience. To this objection it may be replied, that heat is not produced in bodies by the sun instantaneously, nor do the effects of his heat cease immediately when his rays are withdrawn; and, therefore, those parts which are once heated, retain the heat for some time, which, with the additional heat daily imparted, makes it continue, to increase, though the sun declines towards the south; and this is the reason why July is hotter than June, although the sun has withdrawn from the summer tropic; as we find it is generally hotter at three in the afternoon, when the sun has declined towards the west, than at noon, when he is on the meridian. As long as the heating particles, which are constantly received, are more numerous than those which fly away or lose their force, the heat of bodies must continually increase. After the sun has left the tropic, the number of particles, which heat our atmosphere

mosphere and earth, constantly increases, because we receive more in the day than we lose at night, and therefore our heat must also increase. E. g. Let us suppose that there are 100 heating particles received in the day, whilst the fun is above our horizon, and that, as the night is much shorter, 50 of them fly off; the other 50 still remaining to excite heat: the next day, the sun acting with almost the same force, will impart 100 particles more, of which one half will escape in the night; so that, on the beginning of the third day, the number of particles exciting heat will be increased by 100: and thus while there are more particles that excite heat received in the day-time than those that fly off in the night, the heat must increase. But as the days decrease, and the action of the sun becomes weaker, more particles will fly off in the night-time than those we receive in the day, by which means the earth and air will gradually cool. Farther, those places which are well cooled require time to be heated again; and, therefore, we find January for the most part colder than December, although the sun has withdrawn from the winter tropic, and begins to emit his rays more perpendicularly upon us.

It is well known, that the sun is farther from the earth in summer than in winter, because his apparent motion is slower, and his apparent diameter less in June than in December: but, as the EXCENTRICITY of the earth's orbit bears no greater proportion to the earth's mean distance from the sun than 17 does to 1000, this small difference of distance cannot occasion any great difference of heat or cold. But the principal cause of the difference between the heat of summer and that of winter is, that in summer the rays fall more perpendicularly, and pass through a less dense part of the atmosphere; and, therefore, with greater force, and in greater number on the same place: and, besides, by their long continuance, a much greater degree of heat is imparted by day than can fly off by night. The effect of rays, according to their various degrees of obliquity, has been already stated, and it will appear (by *Tab. III. Astron.*, fig. 79) that a greater number of rays fall on the same place, when they come perpendicularly, than when they come obliquely upon it: for, let AB represent a certain number of the sun's rays falling on CD, e. g. London, on the 21st of June; but on the 22d of December, the line CD or London has the oblique position CD to the same rays; and, therefore, scarce a third part of them falls upon it, or only those between A and E, all the rest being expended on the space EF, which is more than double the length of CD or CD.

Dr. Long, estimating the degree of heat by the lines of the angles of incidence of the sun's rays, computes the sun's heat at noon at the summer solstice to be in proportion to his heat at noon at the winter solstice, in Cambridge, nearly as 200 to 28; for, the meridian height of the sun, at the summer solstice, being there $61^{\circ} 19'$, and his height at the winter solstice $14^{\circ} 21'$, the lines of these angles are 8773858 and 2278445 respectively.

Mém. De Mairan, allowing for the principal causes of the summer heat, finds the proportion of summer heat to that of winter as 66 to 1. The method he pursues in forming his calculation is briefly as follows: he assigns the proportion of the lines of the meridional heights of the sun at the summer and winter solstices to be as 3 to 1, and the ratio of the heat, which he supposes to be as the squares of the lines, that of 9 to 1; and as the rays of the sun proceed through a less space of air in summer than in winter, he states the increase of summer heat on this account to be in the proportion of 2 to 1, and that arising from the greater length of days as 4 to 1; and, therefore, the heat of summer is to that of winter as 72 to 1. But there are some other circumstances, particularly the greater distance of the sun in summer than in winter, which induce him to reduce this proportion of 72 to 1 to that of 66 to 1.

However, M. Amontons has, from observation, made the proportion of summer heat to that of winter as 60 to 51; and M. De Mairan, in order to reduce his calculation to fact, supposes that in the earth and air there is a constant fund of heat, equal to 333 degrees, to which 66 degrees must be added in summer, and 1 in winter, and thus he adjusts his own proportion of 66 to 1 to that of M. Amontons, or 60 to 51. *Keil's Arb. Loci*, viii. *Ferguson's Arb.* chap. v. *Long's Arb.* § 777. *Mém. Acad. Scienc.* 1710.

With regard to the temperature or heat of our atmosphere, we may observe that the mercury seldom falls under 16° in Fahrenheit's thermometer; but we are apt to reckon it very cold at 24° , and it continues coldish to 40° and a little above. However, such colds have been often known as to bring it down to 0° , the beginning of the scale, or nearly the cold produced by a mixture of snow and salt. This, as Dr. Boerhaave seems to think,

is the greatest degree of cold which nature has ever been observed to produce on our earth; but the fallacy of this opinion has been evinced by a variety of observations in climates that may be reckoned ordinarily temperate. In Pennsylvania, in lat. 40° , the cold brought the mercury to 5° in 1731; at Paris, in 1709 and 1710, the mercury sunk to 8° ; at Leyden, in 1720, to 5° , and at Utrecht to 4° ; at London, in 1709 and 1710, the cold sunk the spirits almost down to the artificial cold of an ice and salt mixture; and in 1709, the mercury sunk to 0° at Copenhagen, lat. $55^{\circ} 43'$. At Upsal, in 1733, the cold was so great as to be sufficient to make the mercury fall one degree below 0° ; and at Peterburgh, lat. $59^{\circ} 56'$, much the same with that of Upsal, the cold was severe enough to depress the mercury to 28° below 0° .

We learn from Dr. King's Observations on the Climate of Russia, that the cold at St. Peterburgh, during the months of December, January, and February, is usually from 8 to 15 or 20 degrees below 0° ; and that commonly, in the course of the winter, it is for a week or ten days some degrees lower. In this season, the water issuing from the eyes hangs in little icicles on the eye-lashes, and icicles appear suspended to the beards of the peasants in form of solid lumps of ice. But in still more northern latitudes, the cold is much more extreme. Maupertuis, who wintered at the north polar circle in 1736-7, found the degree of cold at Torneo, lat. $65^{\circ} 51'$, sufficient to have made the mercury sink to 33 divisions below 0° . By Mr. Hutchins's observations at Albany Fort, lat. $52^{\circ} 24'$, the thermometer was at eight o'clock in the morning of the 10th of January, 1775, at 37° below 0° . And yet this degree of cold is inconsiderable, compared with that which may be produced by art. See FREEZING.

The middle temperature of our atmosphere is about 48° , which is, as it were, the medium of all the seasons, coinciding nearly with the middle vernal and autumnal heat, as observed in England by Sir Isaac Newton and Dr. Hales, and by Mr. Crucius in Holland. The French make it somewhat higher, reckoning it equal to the heat of the cave of their royal observatory, or 53° . In cold countries the air will be found agreeable enough to the inhabitants while it is betwixt 40° and 50° . In our climate we are best pleased with the heat of the air from about 50 to 60° ; while in the hot countries, the air is generally a little above or below 70° . With us the air is not reckoned warm till it arrives at about 64° , and it is very warm and sultry at 80° ; and Dr. Boerhaave thought, that in its natural state it scarce ever exceeded 80 or 90° , apprehending that such hot air would soon be destructive of the life of animals: but in these temperate climates it has been found much hotter; and at Utrecht, Paris, Padua, &c. the mercury would have risen in our thermometer to above 90° . In Pennsylvania, the summer heat in 1733 was once 96 or 97° ; and at Astracan, in July 1746, the heat was so great as to raise the mercury in M. De L'Isle's thermometer in the shade to 89° , which corresponds to 103° of Fahrenheit's; and during the whole month of July, and for several days in August, it was higher than 90° , which in Fahrenheit's denotes the natural heat of the blood. *Mém. de l'Acad. de Berlin*, 1746. See ANIMAL HEAT.

The preceding observations are applicable to the state of the air, influenced by the sun, but shaded from its immediate burning operation; for, in the open air, exposed to its direct beams shining with greatest advantage, the heat is found much higher. Many have had occasion to observe how much metals are heated in the sun: Dr. Martine found dry earth heated to above 120° ; and Dr. Hales found a very hot iron-rod in 1727 to be about 140° ; but Dr. Muschenbroek once observed it to high as 150° ; and if we reckon from the freezing point at 32° , these strong iron-rod heats were much greater than 1, or even the half of the heat of boiling water. At Montpellier the sun was so very hot, on one day in the year 1705, as to raise the quicksilver in M. Amontons's thermometer to the mark of boiling water itself, which is our 212° . But the most common noon-time heat of the sun in our climate has been found to raise the mercury in the thermometer to about 60 or 70 divisions above the freezing point at 32° ; and the afternoon heat in the shade about the half of that; and, therefore, the ordinary summer sun heat with us does nearly coincide with the heat of our body, and boiling water is between two and three times hotter than our common shaded, warm air at Midsummer.

Sir Isaac Newton informs us, that he found the heat of boiling water only about three times greater than the heat communicated to dry earth by the summer sun, or about 92° , with which the observations of Muschenbroek agree; and in Italy, Borelli and Malpighi found this heat at Midsummer equal to the heat of the viscera

of hot animals, or about 102° . In another place (viz. Princip. lib. iii. prop. 8. cor. 4.) Sir Isaac Newton estimates the *heat* of boiling water to be seven times greater than the *heat* of the summer sun, which in this reckoning should be only at $(32 - 4)^{\circ} = 58^{\circ}$; by which, as Dr. Martine remarks, he must have meant solely the number of degrees above freezing water, and by summer sun, the ordinary heated air in summer, or the summer *heat* of the air. Martine's Ess. Med. and Phil. 1720. Et. vi. It appears, from a register of the thermometer kept at London by Dr. Heberden for nine years, viz. from the end of 1763 to the end of 1772, that the mean *heat* at eight in the morning was $47^{\circ} 41'$; and by another register kept at Hawkhill, near Edinburgh, that the mean *heat* in that place, during the same period of time, was 46° . By registers kept in London and at Hawkhill, for the years 1772, 1773, 1774, it appears, that the mean *heat* of these three years in London, at eight in the morning, was $48^{\circ} 5'$; and at two in the afternoon 50° , and the mean *heat* of three years, both morning and afternoon, $52^{\circ} 2'$; and the mean *heat* at Hawkhill for the same time, at eight in the morning, was $45^{\circ} 4'$, and at two in the afternoon $50^{\circ} 1'$, and the mean *heat* of morning and afternoon for the whole time $47^{\circ} 7'$. The mean *heat* of spring near Edinburgh seems to be 47° , and at London 51° . Phil. Transf. vol. lxx. part ii. art. 44.

From the Meteorological Journals of the Royal Society, published in the Philosophical Transactions, it appears, that the mean heights of the thermometer, kept without and within the house, are as below:

	Therm. without.	Therm. within.
For 1775	- 51.5	52.7
1770	- 51.1	52.9
1777	- 51.0	53.0
1778	- 52.0	53.1

And, therefore, according to these observations, the mean *heat* of four years, estimated by the external thermometer, is $51^{\circ} 4'$. The least height during this period was on 31st January, 1776, at eight in the morning, when it was $35^{\circ} 5'$; and the greatest height, which was on the 13th and 14th of July, 1778, at two in the afternoon, was 86° .

HEAT, animal. The *heat* of animals is very various, both according to the variety of their kinds and the difference of the seasons: accordingly, zoologists have divided them into hot and cold, reckoning those to be hot which are near our own temperature, and all others cold whose *heat* is much below ours, and, consequently, affects us with the sense of cold; though, by their *own* *heat*, they are kept somewhat warmer than the medium in which they live. To this latter class writers have commonly referred the whole insect tribe; though Dr. Martine observes with respect to bees, that the *heat* of a swarm raised a thermometer buried among them above 97° , indicating a degree of *heat* scarce, if at all, inferior to our own. To this class also belong mules and oysters, the branchial fishes, snails, frogs, land and sea tortoises, toads, vipers, and all the serpent kind.

The human kind forms the lowest gradation in the class of hot animals: the *heat* of the human body, in its natural state, according to Dr. Boerhaave, is such as to raise the mercury in the thermometer to 98° , agreeing with Dr. Pitcairn's observation of the *heat* of the human skin, or at most to 94° . M. Amontons, by several trials, found the *heat* communicated by the human body to be 91° , 92° , and 93° . Sir Isaac Newton makes the external *heat* of the human body, of the same temperature with that of a bird hatching eggs, to be $95^{\circ} 5'$. Fahrenheit states the *heat* of the human body and blood at 96° , which Meuschenbroek assigns to be the degree of *heat* communicated to the thermometer when immersed in the blood flowing from an animal. Dr. Martine infers, from a great number of trials, that the mean *heat* of the human skin is about 97° or 98° ; being a little higher in some subjects, and a little lower in others; and the *heat* of the human urine, by which we may judge of that of the neighbouring viscera, he says, is scarcely a degree hotter than the skin. Dr. Hales found the *heat* of his skin to be about 97° , and the *heat* of urine newly made about 103° . Mr. Hunter found, by sinking the ball of the thermometer under his tongue, and keeping it there for some minutes, that the mercury rose to 97° : in another experiment, he introduced the ball of the thermometer into the urethra about an inch, and when it had remained there a minute, the quicksilver rose only to 92° ; at two inches it rose to 93° ; at four inches to 94° ; and when the ball had got as far as the bulb of the urethra, the quicksilver rose to 97° . The *heat* of the rectum was 98° exactly.

With respect to ordinary quadrupeds, such as dogs, cats,

sheep, oxen, swine, &c. the *heat* of their skin raises the thermometer four or five divisions higher than that of the human kind, viz. to 102° , 103° , 104° , and some to 103° and a little more. The cutaneous fibres are as hot as their *heat*; and the blood kind, as hot as the long since observed, are warmer by three or four degrees than quadrupeds: for Dr. Martine has found, by lodging the bulb of the thermometer in the groin of ducks, geese, hens, &c. that the mercury was raised to 103° , 104° , 105° , 106° , and 107° , and in a hen hatching eggs, he once found the height to be 108° . Dr. Crawford has collected the following observations, relating to this subject: that those animals which are furnished with lungs, and which continually refresh the fresh air in great quantities, have the power of keeping themselves at a temperature considerably higher than the surrounding atmosphere; but animals that are not furnished with respiratory organs, are very nearly of the same temperature with the medium in which they live; the former, according to his theory, which we shall explain in the sequel of this article, continually absorbing *heat* from the air, for which purpose they are provided with a pulmonary system and double circulation. Farther, among the hot animals, those are the warmest which have the largest respiratory organs, and which, consequently, breathe the greatest quantity of air in proportion to their bulk: thus, the respiratory organs of birds, compared with their size, are more extensive than those of any other animal; and birds are known to have the greatest degree of animal *heat*. This fact is likewise explained by the same theory, and affords a confirmation of it; for, if animal *heat* depends upon a change which the air undergoes in the lungs, it is evident that, all other circumstances being equal, the greater the quantity of air which is changed in a given time, the greater must be the *heat* produced. Moreover, in the same animal, the degree of *heat* is in some measure proportionable to the quantity of air inspired in a given time: thus, we find, that animal *heat* is increased by exercise and by whatever accelerates respiration.

But it is observed, that the *heat* of animals varies in different individuals, and likewise in the same animal at different times; for, though in a healthy state, the variations are not great, yet by accidents and diseases they may be much altered, and brought considerably above and below the natural standard. Dr. Hales supposes the *heat* of the human blood in high fevers to be about $106^{\circ} 41'$; and Dr. Boerhaave relates certain experiments of Fahrenheit and others, from which it appears, that animals were very soon destroyed in a *heat* of 146° : a sparrow having died in less than seven minutes, a cat in about fifteen, and a dog, in twenty-eight; and he concludes in general, that the serum of the blood may be coagulated by a degree of *heat* not much above 100° ; whence Dr. Hales and Dr. Arbuthnot have been led to affirm, that the natural *heat* of the blood of a human creature approaches very near the degree of coagulation. But Dr. Martine observes, that he has found the blood to be heated five or six degrees above 100° , without any such pernicious effects; and that the serum of blood and the white of an egg have continued thin and liquid, till the thermometer had indicated a degree of *heat* equal to 156° , which he supposes to extend beyond any thing that can ever be experienced by a living animal. The late ingenious Mr. Hewson infers, from several experiments, that the lymph of the human blood coagulates at a degree of *heat* between 114° and 120° ; and that the serum does not coagulate without 160° of *heat*; there is, therefore, no ground for the apprehension of Boerhaave and others, that the blood should be coagulated by the animal *heat*, even whilst it is circulating in the blood-vessels; since the animal *heat* is naturally only 98° or 100° , and in the most ardent fever it is not raised above 112° . Phil. Transf. vol. lx. art. 33.

From some experiments made by Dr. Debon in a heated room it appears, that the white of an egg, inclosed in its own film, remained fluid in a *heat* of 224° , but coagulated in the same *heat* when contained in a tin vessel or its own shell: he offers several conjectures for the explanation of this phenomenon, the most probable of which seems to be, that tin is a more powerful conductor of fire from air, and robs this medium of its *heat* more readily than the film can do.

Philosophers, misled by the opinion of Boerhaave and the experiments above recited, have very generally imagined, that animals were incapable of enduring, without danger, any very considerable degree of *heat*; however, governor Ellis had observed, as long ago as the year 1758, that a man can live in air of a greater *heat* than that of his own body, and that the body in this situation continues its own cold. Phil. Transf. vol. i. p. 755. Nevertheless, it was scarce conceivable, by reasoning a priori

prini and in opposition to a supposed fact, that the human body could be safely exposed to a heat only of the degree which proved fatal to the animals in the experiments related by Boerhaave. Accident, we may say, first led to the discovery of the fallacy of the general opinion on this subject. Messrs. Du Hamel and Tillet being employed in the years 1760 and 1761, in destroying an insect which consumed the grain of the province of Anjoumois, continued, for this purpose, to expose the affected corn, with the insects included in it, in an oven, the heat of which was sufficient to kill them without injuring the grain. With a view of ascertaining the heat of this oven, they conveyed into it a thermometer; and being desirous of knowing the precise heat of the mercury whilst the thermometer remained in the oven, a girl, one of the attendants on the oven, entered it, and marked the thermometer with a pencil, after staying two or three minutes, and the heat was found to be near 260° of Fahrenheit's scale: the afterwards remained there ten minutes longer, the mercury in the thermometer standing at 288°, or 76° above that of boiling water; and when she came out of the oven her complexion was considerably heightened, but her respiration was by no means quick and laborious. These experiments were afterwards repeated, when another girl remained in the oven without much inconvenience, and under the same degree of heat, as long as the former, and even breathed in air heated to about 325° for the space of five minutes. This girl, says M. Tillet, was protected from the external action of the heat by their cloths, which are bad conductors of heat, and enabled to breathe the air, thus violently heated, for a long time, without great inconvenience: to which we may add, says an ingenious anonymous remarker on this experiment, that the bulk of their bodies might also contribute to their security; and, as in common respiration, the blood in its passage through the lungs is cooled by being brought into contact with the external inspired air: in the present case, on the contrary, the vessels and vessels of the lungs, receiving at each inspiration an air heated to 300°, must have been continually cooled and refreshed, as well as the subcutaneous vessels, by the successive arrival of the whole mass of blood contained in the interior parts of the body, whose heat might be supposed, at the beginning of the experiment, not to exceed 100°. Hist. Acad. Science. 1764. mem. ii. Month. Rev. vol. xxviii. p. 680.

A few extraordinary facts might possibly lead philosophers into a new train of reasoning and experiment on the subject of heat: accordingly we find, that Dr. Cullen has long ago suggested many arguments to shew, that living animals have a power of generating heat, independently of any common chemical or mechanical means, either of friction or fermentation, and also of generating cold or destroying heat, when the heat of the atmosphere exceeded the proper temperature of their bodies. In order to examine and ascertain this theory, Dr. George Fordyce prepared a suit of three rooms heated by flues in the floor; in one of which the air was in a dry state, and in another loaded with moisture, by pouring boiling water on the floor. In the first room the highest thermometer stood at 120°, and the lowest at 110°; in the second the heat was from 90° to 85°; and the third room felt moderately warm, whilst the external air was below the freezing point. Dr. Fordyce, having undressed himself to his shirt in the third room, entered the second room, and staid five minutes in a heat of 90°; he then entered the first room, and, having remained in the part heated to 110° for ten minutes, the water running down in streams over his whole body, he removed to the part of the room heated to 120°, and after staying there twenty minutes, he found that the thermometer, placed under his tongue and held in his hand, stood just at 100°, and that his urine was of the same temperature: his pulse had gradually risen till it made 145 pulsations in a minute; the external circulation was greatly increased, but his respiration little affected. The moisture of his skin, he apprehended, was chiefly owing to the condensation of the vapour in the room upon his body. In the second experiment, the highest thermometer in the first room varied from 125° to 130°, and the lowest stood at 110°. Having undressed in an adjoining chamber, he went first into the heat of 110°, and in half a minute the water flowed down over his whole body in streams; having remained here fifteen minutes, he went into the heat of 130°; at this time the heat of his body was 100°, and his pulse beat 126 times in a minute: in this situation a Florence flask, filled with water heated to 100°, and wiped dry, became wet, and streams of water continued to run down his feet, till the heat of the water within had risen to 125°. In this heat he remained fifteen minutes, and just before he left the room his pulse made 139 beats

in a minute, but the heat under his tongue, in his hand, and of his urine, did not exceed 100°.

Dr. Fordyce observes, on this experiment, that there was no evaporation, but constantly a condensation of vapours on his body, and no cold was generated but by the animal powers. Having continued much longer in a much greater dry heat without being so much affected, he takes occasion to infer, from this circumstance, that dry air does not communicate its heat like air saturated with moisture; and that the evaporation from the body which takes place when the air is dry, affords its living powers in producing cold.

In another experiment, Dr. Fordyce, accompanied with four other gentlemen, went into the heated chamber where the air was dry, without taking off their cloths. When they first entered the room, the quicksilver stood above 130°, and they continued in it more than twenty minutes, in which time the heat had risen about 12°. In another period of this experiment, the quicksilver stood at 135°, and they continued in this heat about ten minutes; but finding that the thermometer sunk very fast when they went together, they agreed to go in separately. Dr. Solander stood in the room heated to 210° for three minutes, during which time the quicksilver sunk to 196°; and Mr. Banks remained seven minutes in the heat of 211°, in which time the quicksilver had sunk to 198°. The heat of their bodies in these several experiments rose very little above its usual state; and many striking effects proceeded from their power of preserving their natural temperature. Whenever they breathed on the thermometer, the mercury sunk several degrees; every expiration afforded a pleasant cooling impression to the nostrils, and their cold breath cooled their fingers. Dr. Blagden, on touching his face, found that it felt like a corpse, though the actual heat of his body was 98°. When the heat of the air began to approach the highest degree which the apparatus made use of was capable of producing, their bodies in the room prevented it from rising any higher; and when it had been previously raised above that point, immediately sunk it. These, and other circumstances attending the experiments, clearly prove, that the body has a power of destroying heat; but, in estimating the heat which we are capable of resisting, it is necessary to consider not only what degree of heat would be communicated to our bodies, if they possessed no resisting power, by the heated body, before the equilibrium of heat was effected, but also what time that heat would take in passing from the heated body into our bodies. On this principle, we hear very different degrees of heat in different mediums; and it appears, by other experiments, that the same person, who felt no inconvenience from air heated to 211°, could not bear quicksilver at 120°, and could just bear rectified spirit of wine at 130°. I. e. quicksilver heated to 120° (surrounded, in a given time, more heat for the living powers to destroy than spiritus heated to 130°, or air to 211°). Accordingly, when they were in the heated rooms, their watch-chains and other pieces of metal felt so hot, that they could scarce touch them; whilst the air, from which the metal derived all its heat, was only unpleasant. From these experiments, it is concluded that no attrition, fermentation, or whatever else the mechanical and chemical physicians have devised, can explain a power capable of producing or destroying heat, just as the circumstances of the situation require: this power must be referred to the principle of life itself; and yet this is only giving a name to a still unknown cause. This power, however it acts, seems to attend life very universally: Mr. Hunter found a carp preserve a coat of fluid water round him long after all the other water in the vessel had been congealed by a freezing mixture; and he has also shewn, that vegetables possess some degree of this property of generating heat. The sudden melting of snow on grass, whilst that on the gravel walks continues unthawed, and many other similar phenomena, can be adequately explained only on this principle.

In subsequent experiments, the heat of the room was raised to 240°, and sometimes to 260°; these excessive heats were borne for a considerable time with little inconvenience by the gentlemen, who exposed themselves to them, both naked and with their cloths on; nor was the heat of Dr. Blagden's body at all increased, though the velocity of his pulse was, in one instance, more than doubled. A blast of the heated air from a pair of bellows was scarcely to be endured for the following obvious reason: when the flame air remained for any time in contact with the body, part of its heat was destroyed, and, consequently, the body was surrounded with a colder medium than the air of the room; whereas, when fresh portions of the air were applied to the body in such a quick succession, that no part of it could remain in contact a sufficient time to be cooled, the heat must be

continually

sensibly greater. On this occasion the gentlemen evinced the fallacy of the experiment related by Boerhaave, and which has been already mentioned: they put up a bitch in the heated room, when the thermometer had risen to 220° ; in this situation she was suffered to remain, without being immediately affected, for $3\frac{1}{2}$ hours, and when she was released, and brought again into the cold air, she appeared not to have received the least injury. In the same heated air, which they breathed, eggs were roasted quite hard in 20° , and beef-steaks were dressed in 33° , and by blowing the air upon some of them, in 15° . The effect of EVAPORATION, in preventing certain bodies, and particularly fluids, from receiving a degree of heat equal to that of the air, is shown by some of these experiments to be very considerable. In the great *heat* just mentioned, pure water exposed in an earthen vessel, during an hour and a half, acquired only a *heat* of 140° , and afterwards continued stationary above an hour, at a degree much below the boiling point; but when its power of evaporating was checked, by dropping a small quantity of oil on its surface, it boiled very briskly. A saturated solution of sea-salt acquired a *heat* of 230° , and was, consequently, brought into a brisk ebullition, on covering its surface with a layer of oil.

Dr. Dobson has also published an account of similar experiments made by him in the sweating-room of the hospital at Liverpool; the results of which are conformable to those that have been already recited. It appears from these, as well as from the former experiments, that the pulse is considerably accelerated by heated air, whilst the animal *heat* varies little from its natural standard; a fact, which, as Dr. Dobson observes, contradicts the opinion that has been generally received with regard to the cause of animal *heat*, viz. that it is produced by the attrition of the globules of the circulating fluids against the sides of the containing vessels; whereas it is seen, that the circulation may be amazingly quickened, whilst there is little increase of the animal *heat*.

We may conclude in general, from the experiments and observations already recited, that man is so framed as to possess a power of keeping nearly the same tenor of *heat* in all the variations of the temperature of the air in summer and winter, in hot and cold climates; and, consequently, changes his situation on the surface of the globe with much less inconvenience or injury than he could otherwise have done. The same power likewise happily adapts different animals to their respective destinations: the lizard and the camelion remain cool under the equator, whilst the whale and porpoise retain a degree of *heat* above that of the human body, though surrounded with the waters of the coldest northern seas, and amidst mountains of ice, in the neighbourhood of the pole.

Dr. Crawford observes, with regard to the power above illustrated, which animals possess, of producing cold, that, by the heat of the surrounding medium, the evaporation from the lungs is increased; and that if this increase to such a degree as to carry off the whole of the *heat* which is detached from the air, the arterial blood, when it returns by the pulmonary vein, will have its sensible *heat* greatly diminished, and will, consequently, absorb *heat* from the vessels which are in contact with it, and from the parts adjacent. And thus the same process, which in one case supplies the animal with *heat*, according to Dr. Crawford's theory, explained in the sequel of this article, will now become the instrument of producing cold; and the quantity of cold produced will be in proportion to the velocity of the blood through the lungs, and the fulness and frequency of the respiration. Thus, in winter seasons, and cold climates, the vessels on the surface of the body are constricted, the blood is determined to the lungs, and the pulse and respiration are rendered full and frequent; so that the quantity of *heat* absorbed from the air is proportionably increased. But in summer, the blood is determined to the surface, the velocity of the circulation through the lungs is diminished, and the quantity of *heat* absorbed is diminished; besides, if the quantity of *heat* absorbed by the vapour exhaled in respiration be so great, as that the remaining portion of the *heat* deposited by the air is not sufficient to support the temperature of the arterial blood, some degree of cold will be produced in consequence of the change which the blood undergoes in the lungs. Martine's Essays, Ess. vi. Phil. Trans. vol. lxx. part 1. art. 12. Id. ibid. part 2. art. 43. art. 45. art. 47. Id. vol. lxxii. part 1. art. 2. Crawford on *Heat*, &c. p. 31. &c.

There is hardly any subject of philosophical investigation that has afforded a greater variety of hypotheses and conjectures, and experiments, than the origin of animal *heat*. The reader will find the principal of them enumerated, and briefly illustrated, in this article. The first opinion which has very generally obtained is, that the *heat* of

animal bodies is owing to the attrition betwixt the arteries and the blood.

The arguments in favour of this opinion are, that if an artery is tied or cut, the part to which it goes turns cold; on the ceasing of the pulsation of the arteries, cold and death follow. An increase of *heat* attends a brisk circulation, and a languid circulation is accompanied with a small *heat*; but it has been already shown, that this is not universally the case. One who burns in a fever, or is hot with exercise, has a full and frequent pulse; in cold faintings, chlorosis, &c. the pulse is small and slow; and lastly, that the thermometer shews the arterial blood to be a little hotter than that of the veins. This is accounted for from the conical figure of the arteries, from their flexures and branchings into exquisitely small capillaries; whence the resistance and consequent attrition must be great; from the number, strength, and elasticity of their coats; from the propelling power of the heart, and their strong resistance. From all these the particles of the blood perpetually getting new motions, directions, and rotations, are attenuated, condensed, have their angles ground off, and are made homogeneous: hence the fluidity, red colour, and *heat* of the mals, which is here perfected. But this theory is doubtful; for what is said of arteries, may be said of any other parts, whose functions are necessary to life. The *heat* and pulsation of the arteries do not keep together in any regular proportion; in some morbid cases there is a great sensible *heat*, and a small pulse; and in others a full pulse, and great coldness. Besides, all the length this demoultration goes, is to shew, that the motion of the arteries and *heat* are generally in proportion, which, however, does not shew which is the cause, and which the effect; nor indeed that either is the cause or effect of the other, since both may be the effects of some other cause. As to the proof by the thermometer, it seems doubtful; and what adds to the doubt is, that the venal blood does not coagulate so soon as the arterial. In short, this theory is not established by any satisfactory and convincing proof.

Dr. Douglas, in his Essay on the Generation of *Heat* in Animals, ascribes it solely to the friction of the globules of blood in their circulation through the capillary vessels.

The second opinion is, that the lungs are the fountain of *heat* in the human body. All that has been said for the blood's being heated in the arteries, is advanced to prove this hypothesis, with considerable addition, viz. that in the lungs the blood-vessels every where attend, divide, and subdivide, along with the ramifications of the wind-pipe; and as these are perpetually changing their situation and form, becoming longer or shorter, making more acute or more obtuse angles, so must the concomitant blood-vessels every moment make new angles, and give the blood new directions; that at last the blood enters into an exquisitely fine network, spread every where on the vastly thin air vessels, where these air-bladders are perpetually changing their angles, points of contact, their form, volume, interstices, and so forth. From these, and the elasticity of the air, and weight of the atmosphere, the blood is said to be churned, pressed backward and forward, broken and kneaded together, dissolved and condensed, made red and hot in respiration. This theory, however plausible, is not satisfactory. For, 1. What was said before of the improbability of *heat* being generated by the sole attrition of fluids, takes place here.

2. Though the lungs be regularly supplied with plenty of air, which has weight and elasticity enough to carry on the alternate swelling and subsiding of the vessels; yet life and *heat* soon fail, if that air has, by passing through the fire, or any other way, been robbed of, or if it has acquired some particles or quality different from its weight and elasticity. 3. The argument from the additional action of the folds of the lungs on the blood, more than what is found in the arteries, from their greater and constantly varying motion, seems to be fully taken off by one part of Hook's experiment, exhibited before the Royal Society, in which the lungs of a dog being kept constantly distended by a fresh blast of air, the dog lived, and his heart beat regularly; so that there is no need of that frequent and great variation of angles, and points of contact, upon which the additional attrition is built. 4. That the cold air rushing into the spongy lungs, on the numberless air-bladders, on which the blood is almost superficially spread, should make the blood hot, is an improbable opinion, and supported by no proof. And as the cause appears not at all promising *a priori*, so the effect seems to demonstrate this not to be the cause. For, 5. That the blood is rather cooled than heated in the lungs, may be inferred from the benefit received by the inspiration of cool air in many inflammatory diseases, especially those of the lungs. In burning fevers, with a full quick pulse, red skin, and a large and

quick respiration, relief has often been given by opening a window, and admitting a stream of cool air to breathe in; the effects of which have been observed to be, that though the body was close covered, yet in one minute the respiration became slower, and very soon after the pulse abated of its fullness, and not only the face, but the whole body, of its fiery heat and colour. 6. If the blood were heated in the lungs, we should need less of their functions, when we are warm, or in a warm place, the heat of our bodies, or of the atmosphere, doing so much of the office of the lungs; and we should want more of it, when cool, or in cool air. But when we are hot, and want to be cooled, we breathe full and quick; and when we are cold, and want to be warmed, our respiration is slow and small; contrary to what one would expect, if the action of the air on the blood in the lungs were to heat it. 7. The blood which comes from the small vessels of the lungs, is not more expanded than before, as has been asserted, but not proved by any experiment, which it would certainly be, if it was hotter; for liquids rarely by heat, and few more than blood. 8. If the blood owes its heat to the action of the lungs, we must look out for another source of heat in the eggs and fetuses. To the objection, that the heat of the mother is sufficient for the purpose, till this new function comes into action, two observations may be opposed: the first is, that toward the end of incubation, an egg may be left by the dam, in a cold season, for a little longer time than would be safe for the chick, if all its heat depended upon her; yet long enough for an egg, that contains no warm principle to become of the temperature of the ambient air; yet upon opening it, the chick has been found neither quite so cold, nor dead. The second is, that a ripe fetus taken away from the mother, but continuing within the membranes, can live several hours by its own heat, without any assistance from the lungs. What is the cause of this heat before the lungs act? How comes it to fall as soon as the lungs play? Med. Ess. Edinb. abrid. vol. i. p. 228.

The third opinion is, that the cause of animal heat is owing to the action of the solid parts upon one another. The heart and arteries move, and it is natural to expect, that the heat should be owing to this motion. But even this does not seem very plausible, from the following considerations: 1. The moving parts, however we term them solid, are neither hard nor dry; which two conditions are absolutely requisite to make them fit to generate heat by attrition. 2. None of their motions are swift enough to promote heat in this way. 3. They have no great change of surface in their attrition. 4. The moveable fibres have fat, mucus, or liquors every way surrounding them, to prevent their being destroyed, or heated by attrition.

A fourth cause assigned for the heat of our bodies, is that process by which our aliment and fluids are perpetually undergoing some alteration.

This process, according to Dr. Stevenson, may be one *fermentatio*, somewhat of a middle nature, betwixt fermentation and putrefaction; and he thinks it to come so near to the latter, that he chooses to call it by that name. In putrefaction, which is a most powerful solvent of bodies, the intestine action of their minute particles creates, collects, or forms way or other is the cause or means of heat. The doctor thinks it probable, that this process is constantly carried on in all our juices, especially where there is blood, and this chiefly in the veins; so that the blood is both the fountain of heat, and the first spring of motion. He observes, that it is agreeable to the laws of natural philosophy to reason on the chemistry of the animal body, as well as on its mechanics; the minute component parts of solids having a set of laws peculiar to them; and their intimate changes and actions on one another are not to be accounted for by the coarse mechanical laws. He observes lastly, that since it has never been demonstrated, that any fluid acquired heat in the coarse mechanic way, by friction with a solid body; or that to considerable a change was made on the structure of the minute parts of bodies, as is made in this process, without producing heat in the same time; and since in fermentations, putrefactions, &c. the heat is not pretended to be owing to the vessels containing the changed subject, but to what happens to its minute parts, in undergoing the changes, it seems, on the whole, an unphilosophical partiality for mechanics to maintain, that our juices have all their heat communicated to them from the solids, and that they acquire it by rubbing with the vessels. See Medic. Ess. Edinb. vol. v. art. 77. Abrid. vol. i. p. 222, seq.

The ingenious Dr. Franklin inclines to this hypothesis, when he says, that the fluid fire, as well as the fluid air, is attracted by plants in their growth, and becomes consolidated with the other materials of which they are formed, and makes a great part of their substance; that,

when they come to be digested, and to suffer in the vessels a kind of fermentation, part of the fire, as well as part of the air, recovers its fluid active state again, and diffuses itself on the body digesting and separating it; that the fire so reproduced, by digestion and separation, continually leaving the body, its place is supplied by fresh quantities, arising from the continual fermentation; that whatever quickens the motion of the fluids in an animal, quickens the separation, and reproduces more of the fire, as exercise, &c. Hence he conceives, that animal heat arises by or from a kind of fermentation in the juices of the body, just as heat arises in the liquors preparing for distillation; and he adds, it is remarkable that the liquor in a distiller's vat, when in its highest and best state of fermentation, has the same degree of heat with the human body, i. e. about 94 or 96°.

But to this hypothesis it may be objected, that the putrefactive fermentation, which is the only species that can, with probability, be supposed to take place in the body, has been found by accurate experiments to produce no heat at all; as is apparent in a dead body, which continues cold, though tending ever to fall towards putridity. Besides, it may be asked, what fermentative or putrefactive process can possibly be carried on in the bodies of men or animals in such a climate as that of Siberia, where the thermometer frequently stands at 70° or 100° below 0, a heat is necessarily generated, in the body of a man using a proper degree of exercise, equal at least to 96° above that mark? And whether there be any such process, that generates greater quantities of heat in proportion to the increasing degrees of cold in the medium in which the process is carried on? Thus, let the heat of the body at a medium be 94°; and consequently, when the thermometer stands at temperate, or 50°, a heat is generated within the body equal to 44°, which may be considered as additional to the 50°, which the body would possess in a state of death. When the thermometer stands at 32°, the body, with proper exercise, is still 94°, and produces no less than 62 additional degrees of heat; and in the cold above stated of 90° below 0, the body of a living man must produce 184 degrees of heat above that of a dead man exposed in the same situation. Franklin's Exp. and Obs. &c. on Electricity, p. 346, &c. Monthly Rev. vol. xlii. p. 302.

A late author thinks the heat of animals explicable from the phosphorus and air they contain. Phosphorus exists, at least in a dormant state, in animal fluids; and it is also known that they all contain air; it is therefore only necessary to bring the phosphoral and aerial particles into contact, and heat must of consequence be generated; and were it not for the quantity of aqueous humours in animals, fatal ascensions would frequently happen. Dr. Mortimer, ap. Phil. Trans. N° 476. § 20. See *PHOSPHORUS*.

Dr. Cullen, as we have already observed, maintains that the vital principle may have such a peculiar power, that where it is different, different degrees of heat may be generated, though the velocity of the blood be the same. But this appears to be only an occult principle in the animal economy, producing effects in a manner not yet satisfactorily explained. And it seems contrary to experience, and absurd, to assert, that the principle of life can generate heat or cold, independently of chemical or mechanical means.

Dr. Black supposes, that animal heat is generated altogether in the lungs, by the action of the air on the principle of inflammability, and is thence diffused over the rest of the body by means of the circulation; but a late ingenious writer, Dr. Leslie, hath urged several arguments against this hypothesis, tending to show that it is repugnant to the known laws of the animal machine.

Dr. Leslie advances another hypothesis of his own, viz. that the subtle principle by chemists termed phlogiston, which enters into the composition of natural bodies, is in consequence of the action of the vascular system gradually evolved through every part of the animal machine, and that, during this evolution, heat is generated. This opinion, he candidly acknowledges, was first delivered by Dr. Duncan of Edinburgh, and somewhat similar to it is to be found in Dr. Franklin's Works, and in a paper of Dr. Mortimer's, in the Philosophical Transactions. He endeavours to establish this hypothesis by the following arguments: 1. That the blood contains phlogiston. 2. That the action of the blood-vessels evolves phlogiston. 3. That the evolution of phlogiston is attended with heat. 4. That the heat thus generated is sufficient to account for the heat of living animals. 5. That the most striking phenomena of animal heat evince the truth of these propositions. Philof. Inquiry into the Cause of Animal Heat, &c. 8vo. 1778.

With respect to this hypothesis, it may be observed, that it is altogether inconsistent with those experiments of Dr. Priestley, from which it appears, that arterial blood has

to strong an attraction to phlogiston, as to be capable of separating it from fixed and phlogisticated air. See BROWN. The 1st hypothesis we shall mention, is the very plausible one of the ingenious Dr. Crawford, lately published in his *Experiments and Observations on Animal Heat*. It has been already observed, that Dr. Crawford has inferred from a variety of experiments, that *heat* and phlogiston, so far from being connected, as most philosophers have imagined, act in some measure in opposition to each other. By the action of *heat* on bodies, the force of their attraction of phlogiston is diminished, and by the action of phlogiston, a part of their absolute *heat* is expelled. He has also demonstrated, that atmospherical air contains a greater quantity of absolute *heat* than the air which is expired from the lungs of animals; he makes the proportion of the absolute *heat* of atmospherical air to that of fixed air as 6 to 1, and the *heat* of dephlogisticated air to that of atmospherical air as 4 to 1; and observing, that Dr. Priestley has proved, that the power of this dephlogisticated air in supporting animal life is five times as great as that of atmospherical air, he concludes, that the quantity of absolute *heat* contained in any kind of air fit for respiration, is very nearly in proportion to its purity, or to its power of supporting animal life; and since the air expired by respiration is found to contain only the 1/5th part of the *heat* which was contained in the atmospherical air, previous to inspiration, it is very reasonably inferred, that the latter must necessarily deposit a very great proportion of its absolute *heat* in the lungs. It is natural to wish, that Dr. Crawford had made a greater variety of decisive experiments on phlogisticated air, which is not the same with fixed air, and experiments conducted on a larger scale than those from which some of these latter conclusions are deduced, in order to confirm his general theory. An ingenious friend of the editor informs him, that, interpreting Dr. Crawford's experiments with the utmost attention and exactness, he has obtained very different results; and expresses an apprehension, that his system is not sufficiently established by the experiments already published. Dr. Crawford has also demonstrated, that the blood which passes from the lungs to the heart, by the pulmonary vein, contains more absolute *heat* than that which passes from the heart to the lungs, by the pulmonary artery; the absolute *heat* of fixed arterial blood being to that of venous blood as 11 to 10; therefore, since the blood which is returned by the pulmonary vein to the heart has the quantity of its absolute *heat* increased, it must have acquired this *heat* in its passage through the lungs; so that in the process of respiration, a quantity of absolute *heat* is separated from the air, and absorbed by the blood. Dr. Priestley has also proved, that in respiration phlogiston is separated from the blood, and combined with air. From these general principles, the ingenious author infers, that animal *heat* is denegated from the atmospherical air, during the process of respiration, by the action of the phlogiston contained in the blood; the blood at the same moment being left at liberty to unite with that portion of *heat* which the air had deposited; so that a process is carried on similar to a chemical elective attraction. Thus, the air is received into the lungs, containing a great quantity of absolute *heat*, the blood is returned from the extremities, highly impregnated with phlogiston; the attraction of the air to the phlogiston is greater than that of the blood; this principle, therefore, will leave the blood to combine with the air. By the addition of phlogiston, the air is obliged to deposit a part of its absolute *heat*, and as the capacity of the blood for retaining *heat* is increased by the separation of the phlogiston, it will instantly unite with that portion of *heat* which had been detached from the air. Since arterial blood, as Dr. Priestley has proved, has a strong attraction to phlogiston, it will, consequently, during the circulation, imbibe this principle from those parts which retain it with least force; and hence the venous blood, when it returns to the lungs, is found to be highly impregnated with phlogiston. By this impregnation, its capacity for containing *heat* is diminished. In proportion, therefore, as the blood, which had been dephlogisticated by the process of respiration, becomes again combined with phlogiston in the course of the circulation, it will gradually give out that *heat* which it had received in the lungs, and diffuse it over the whole system. Consequently, in respiration the blood is continually discharging phlogiston, and absorbing *heat*; and in the course of the circulation, it is continually imbibing phlogiston, and emitting *heat*. But this *heat* being more than can be absorbed by those parts of the animal system, which communicate the phlogiston to the blood, the surplus becomes redundant, or is converted into moving or sensible *heat*, or that *heat* which is the object of our senses.

The author applies these principles to the explanation of a variety of phenomena accompanying animal *heat*. He

shows, that the causes which prevent the accumulation of *heat* in the animal body, in consequence of its continually absorbing it from the air, are the evaporation from the surface, and the cooling power of the air. These, he observes, are alternately increased and diminished in such a manner, as to produce an equal effect. When the cooling power of the air is diminished by the summer *heat*, the evaporation from the surface is increased; and when, on the contrary, the cooling power of the air is increased by the winter colds, the evaporation from the surface is proportionably diminished. Exercise contributes to accelerate the respiration, and to increase the velocity of the circulation, and, therefore, to increase the quantity of phlogiston discharged, and the quantity of *heat* absorbed. In the cold stage of fevers, preceded by languor, a state of debility, and a diminution in the action of the heart and arteries, the respiration is small, the pulse is weaker than its natural state, and the quantity of blood which passes through the lungs in a given time, is diminished; and hence less phlogiston will be discharged from the body, and, consequently, less *heat* separated from the air. But in the progress of this cold stage, the vessels on the surface of the body will be constricted, and the blood determined to the heart; and, therefore, its velocity through the lungs will be increased, and a greater quantity of *heat* will be absorbed. In the hot stage of fevers, there is a very great evaporation from the surface, which is one of the means employed by nature for moderating the *heat*, and restraining the violence of the disease.

In putrid fevers, as the solid and fluid parts of the system are in a putrescent state, and, consequently, retain their phlogiston with less force, a greater quantity of this principle will be discharged from the lungs, and the air more copiously supplied with it, will impart to the blood a greater proportion of its absolute *heat*; and to these causes it is probably owing, that the *heat* of the human body never rises so high as in putrid fevers. In topical inflammations, the *heat* is accumulated by the increased velocity of the blood through the part inflamed, in the same manner as it is accumulated upon fuel, in combustion, by directing a stream of fresh air into the fire.

Heat of inflammable and combustible bodies. Dr. Crawford's theory with respect to the inflammation of combustible bodies, is founded on the same principles as his doctrine concerning the *heat* of animals. According to him, the *heat* which is produced by combustion is derived from the air, and not from the inflammable body. Inflammable bodies, he says, abound with phlogiston, and contain little absolute *heat*; the atmosphere, on the contrary, abounds with absolute *heat*, and contains little phlogiston. In the process of inflammation, the phlogiston is separated from the inflammable body, and combined with the air; the air is phlogisticated, and gives off a great proportion of its absolute *heat*, which, when extricated suddenly, bursts forth into flame, and produces an intense degree of sensible *heat*. And since it appears by calculation, that the *heat* produced by converting atmospherical into fixed air, is such, if it were not dissipated, as would be sufficient to raise the air to changed, to more than twelve times the heat of red-hot iron, it follows, that in the process of inflammation a very great quantity of *heat* is derived from the air. But, on the contrary, no part of the *heat* can be derived from the combustible body, because the combustible body, during the inflammation, being deprived of its phlogiston, undergoes a change similar to that of the blood by the process of respiration, in consequence of which its capacity of containing *heat* is increased; and, therefore, it will not give off any part of its absolute *heat*, but, like the blood in its passage through the lungs, it will absorb *heat*. E.g. the calx of iron contains more than twice as much absolute *heat* as the iron in its metallic form; so that, in the process of inflammation, the former must necessarily absorb a quantity of *heat* equal to the excess of its *heat* above that of the latter. This *heat* cannot be conveyed from the iron; because the *heat* of the calx is more than double of that which was contained in the iron, previous to the calcination. But in the burning of iron, the phlogiston is separated from the metal, and combined with the air; and by the combination of phlogiston with air, a very intense *heat* is produced; and therefore, in the inflammation of iron, the atmospherical air is decomposed, a very great proportion of its absolute *heat* is separated, part of which is absorbed by the calx, and the rest appears in the form of flame, or becomes moving and sensible *heat*. This sensible *heat* excited in combustion must consequently depend upon the separation of absolute *heat* from the air, by the action of phlogiston. From this reasoning it appears, that, when the air, in which an inflamed body is confined, is saturated with phlogiston, and deprived of the greater part of its absolute *heat*, the source of inflammation will be exhausted, and

and the flame will be necessarily extinguished. Hence we see the reason, why a constant succession of fresh air is necessary to inflammation, as well as to the support of animal life. Moreover, it is manifest, that the less phlogiston, and consequently the more absolute heat any species of air contains, the longer it must contribute to the support of flame as well as to the preservation of life; and this agrees both with the author's experiments, and with those of Dr. Priestley: for Dr. Crawford has found, that dephlogisticated air contains nearly five times as much absolute heat as common air; and Dr. Priestley has shown, that five times as much sensible heat is produced by the conversion of it into fixed and phlogisticated air, as by that of common air; for a candle will continue to burn five times as long in the former as in the latter species of air. It is evident, likewise, that the intensity of the heat, all other circumstances being alike, must be in proportion to the quantity of air which is changed in a given time; and, therefore, the heat may be increased to a very great degree, if a stream of fresh air be directed upon the fuel, by the bellows, or the blow-pipe.

It is observed by Dr. Priestley, that the air which was tainted by combustion and respiration, is again purified by the growth of vegetables (see AIR, phlogisticated); and if this effect be produced by the separation of phlogiston, it follows, that vegetation will restore to the air that heat which had been detached from it in the process of respiration and combustion; and thus the principles of phlogiston and fire, by the medium of atmospheric air, will be continually circulating through the animal and vegetable kingdoms.

A similar theory of heat has lately been published by Mr. Elliott. See his Philosophical Observations on the Senses of Vision and Hearing; to which are added an Essay on Combustion and Animal Heat, &c. 8vo. 1780.

HEAT is usually divided, by the school philosophers, into actual and potential.

HEAT, actual, is that which we have been hitherto speaking of, and which is an effect of real, elementary fire.

HEAT, potential, is that which we find in pepper, wine, and certain chemical preparations, as oil of turpentine, brandy, quick-lime, &c.

The Peripateticians account for the heat of quick-lime from an antiperistasis.

The Epicureans, and other corporealians, attribute even potential heat to atoms of particles of fire detained and locked up in the pores of those bodies, and remaining at rest therein; which being excited to action again by the heat and moisture of the mouth, or by the effusion of cold water, or the like cause, then break their inclosures, and discover what they are.

This doctrine is illustrated by Mr. Lemery the younger, in the instances of quick-lime, regulus of antimony, tin, &c. in the calcination whereof he observes, 1. That the fire, which they imbibed in the operation, makes a sensible addition to the weight of the body, amounting sometimes to one tenth of the whole; and that, during this impregnation, it still retains all the particular properties or characters of fire, as appears hence, that when once set at liberty again, it has all the effects of other fire.

Thus a stony or saline body being calcined, and water poured thereon, that fluid is found sufficient, by its external impulsion, to break up the cells, and let the fire out; and upon this the water is rendered more or less warm, according to the quantity of fire lodged therein. Hence also it is, that some of these bodies visibly contain a great deal of actual fire; and the slightest occasion is capable of disengaging it; and upon applying them to the skin, they burn, and raise an eschar, not unlike the top of a live coal.

To this it is objected, that the particles of fire are only such in virtue of the rapid motion wherewith they are agitated; so that to suppose them fixed in the pores of a body, is to dwell them at once of that which constituted them fire, and, consequently, to disqualify them from producing the effects ascribed to them. To which Mr. Lemery answers, that though the rapid motion of fire doth contribute very greatly to its effects, yet the particular figure of its particles is also to be considered. And though fire should be detained, and fixed in the substance of bodies, yet why should it fare worse than other fluids under the same circumstances? Water, for instance, is a fluid, whose fluidity depends, as already observed, on fire; and consequently, it is less fluid than fire; and yet, every day, water is inclosed in bodies of all sorts, without losing its fluidity, or any of the properties that characterize it as water.

Add, that when water is frozen, the motion of its parts is, doubtless, discontinued; and yet, the figure of the particles remaining the same, it is ready to commence a fluid, as before, upon the least warmth.

Lastly, though salt be allowed to be the matter of tastes,

and that it has certain properties, arising chiefly from the figure of its parts; yet it only acts when dissolved, or, which amounts to the same, when it swims in a fluid proper to keep its parts in motion: yet it is not less salt, or less the matter of taste, when not in a state of dissolution: to deposite it of that quality, the figure of its parts must be altered.

As to what may be further objected, of the impossibility of fixing so fine, subtil, penetrative, and active a matter, as fire, within the spongy substance of a gross, porous body, it will be of no great weight, unless it can be proved, that the pores of the cells are bigger than the fibres. If it be insisted, again, that a body which could find its way into a solid body, might get out again the same way; and that as it only penetrated the body, because its own corpuscles were smaller than the pores, the same consideration must let it out again; it is answered, that the pores are not now in the same condition as before; the fire, in calcining, opened and distended the pores; which, upon the fire's ceasing, must naturally close and contract again. Mem. de l'Acad. an. 1713.

Mr. Boyle endeavours to set aside this account, and substitutes a mechanical property; viz. a peculiar texture of parts in these cases, in lieu of fire. Though a great likeness might be expected between the particles of fire adhering to the quick-lime, and those of highly rectified spirit of wine; yet he has not found, that the effusion of the spirit upon quick-lime produced any sensible heat, or visible dissolution of the lime, though it seemed to be as greedily sucked in, as common water would have been. And farther, he found, that if cold water were poured upon the same lime, to be drenched, there would ensue no manifest heat; nor did the jump appear swelled or broken till some hours after; which seems to argue, that the texture of the lime admitted some particles of the spirit of wine into some of its pores, which were either larger or more fit for it, without admitting it into the most numerous, whereinto the liquor must be received, to be able suddenly to dissipate the corpuscles of lime into their minute particles.

These phenomena, according to Mr. Boyle, seem to shew, that the disposition which lime has to grow hot with water, greatly depends on some peculiar texture; since the aqueous parts, which one would think capable of quenching most of the fiery atoms supposed to adhere to quick-lime, did not near so much weaken the disposition of it to heat, as that excess of the spiritous corpuscles, and their contexture with those of the lime, increased it.

Yet, in other places, this author appears rather to give into the corporeal scheme; urging, that if, instead of cold water, you quench the lime with hot water, the effusion will be, sometimes, far greater than if the liquor were cold; which, indeed, might well be expected, hot water being much fitter than cold suddenly to pervade the body of the lime, and hastily to dissolve, and set at liberty, the fiery and saline parts wherewith it abounds. And what a greater interest salts may have in producing such heats, than cold water, he has also tried, by pouring acid spirits, and particularly spirit of salt, upon good quick lime; for, by this means, there was always a far greater degree of heat excited, than if he had used common water; and this, whether he employed the spirit cold or hot.

It is not easy, says the same author, to apprehend how such light and minute bodies should be so long detained, as must by this hypothesis be allowed, in quick-lime especially; since no great heat ensues the pouring of water upon minium, or *cræta martis præparata*, though they have been calcined by a violent fire, the effluvia whereof seem to adhere to them, by the increase of the weight the lead and iron manifestly receive from the operation of it.

The true cause of the phenomenon, which is the subject of this article, or of the increase of weight which certain substances acquire in calcination, was not generally known, previous to the modern discoveries relating to air. From these it appears, that the additional weight of calcined substances, is not owing, as Mr. Boyle and others imagined, to the particles of fire that fix themselves in the metal, but to the air absorbed by these substances, and adhering to their constituent parts, in the process of calcination. See also FIRED AIR.

This curious discovery was suggested by Jean Rey, a physician at Perigord, in a very scarce book written at the beginning of the last century. *Essais de J. Rey, Sec. à Baza, 1630.*

Mr. Brun, apothecary at Bergerac, had informed him, that having put two pounds six ounces of fine tin into an iron vessel, exposed to a violent heat, during six hours, he found that it was converted into a calx, which weighed seven ounces more than the tin originally employed. This increase of weight, says Jean Rey, proceeds from the air, which has been thickened, rendered heavy, and in some degree adhesive,

by the vehement and long continued heat of the furnace; which air mixes with the calx, and attaches itself to its minutest particles, in the same manner as water adheres and adds weight to those of sand. This air, he adds, is no otherwise changed than in being deprived of its fluidity, which rendered it incapable of adhering to any substance; and in the present case is made more gross, heavy, and adhesive. Abbé Rozier's Observ. sur la Physique, vol. v. or Monthly Rev. vol. li. p. 124. See FIRE.

HEAT, method of estimating its effects on solids and fluids. See PYROMETER and THERMOMETER.

HEAT, in Chemistry. See FIRE.

HEAT, in Medicine. Great heats are not so much the immediate, as the remote cause of a general sickness, by relaxing the fibres, and disposing the humours to putrefaction; especially among soldiers, and persons exposed the whole day to the sun, for the greatest heats are seldom found to produce epidemic diseases, till the perspiration is stopped by wet cloths, fogs, dews, damps, &c. and then some bilious or putrid distemper is the certain consequence, as fevers, and ardent intermitting fevers. Nevertheless, it must be allowed, that heats have sometimes been too great, as to prove the more immediate cause of particular disorders. As when centinels have been placed without cover, or frequent fœtels, in forcing heat; or when troops march, or are exercised in the heat of the day; or when people imprudently lie down and sleep in the sun, all these circumstances are apt to bring on distempers, varying according to the season of the year. In the beginning of summer, these errors produce inflammatory fevers; and, in the end of it, or in the beginning of autumn, a remitting fever, or dysentery.

To prevent, therefore, the effects of intemperate heat, commanders have found it expedient to order the marches, that the men come to the ground before the heat of the day; and to give strict orders, that none of them sleep out of their tents; which in fixed encampments may be covered with boughs, to shade them from the sun. It is likewise a rule of great importance to have the soldiers exercised before the cool of the morning is over; for, by that means, not only the sultry heats are avoided, but the blood being cooled, and the fibres braced, the body will be better prepared to bear the heat of the day. Lastly, in very hot weather, it has been found proper to shorten the centinel duty, when obliged to stand in the sun. Priug's Obs. on the Diseases of the Army, p. 79-95.

HEAT, in Smithery, &c. See IRON.

HEAT is also used, in respect of race horses, for the exercises to be given them by the way of preparation, &c. Two heats in a week are reckoned a just measure for any horse, of what late or constitution forever. The jockeys lay it down as a rule, that one of the heats be given on the same day of the week wherein the horse is to run his match; and this is to be the sharpest heat.

HEATH, *Erica*, in Botany, a genus of the *atlantida myrtina* class. Its characters are these: the flower hath a coloured empanment of four leaves, and one swollen petal, which is quadrifid, with eight stamina fixed to the receptacle; in the bottom is situated a germen, which afterward becomes a round capsule, having four cells, which are filled with small seeds. Miller enumerates four species, which grow wild upon barren uncultivated places in divers parts of England; but notwithstanding their being so common, they deserve a place in small quarters of humble flowering shrubs, where the beauty and long continuance of the flowers, and diversity of the leaves, make an agreeable variety. Linnæus attributes forty-two different species to this genus.

The decoction of *heath* is diuretic; Celsus affirms that Rondeletius, the famous professor of physic at Montpellier, used the oil of its flowers for scurvy with success. Tabernæmontanus says, that it is a specific for these sorts of diseases; and that a fomentation with the flowers of *heath*, eases the pain of the gout. For the same disease they prepare a vapour-bath with its leaves and flowers. Martyn's Tournefort.

The juice, or the distilled water of the flowers, cures redness of the eyes, and mitigates pain in them. A decoction of the leaves taken warm, to the weight of five ounces, morning and evening, three hours before meat, for thirty days successively, is effectual for breaking and expelling the stone in the bladder, as Matthioli experienced. He adds, that he knew some, who, by observing an accurate regimen of diet, by only drinking this liquor, voided the stones from the bladder, crumbled into small particles.

Hence is derived its name *erica*, from *erica*, I break.

HEATH, *berry-bearing*, or *Blackberry* HEATH, *Empetrum*, in Botany, a genus of the *dissida triandria* class. Its char.

Vol. II. N° 168.

acters are these: it hath male and female flowers on different plants; the male flowers have a three-pointed empanment, and three petals, which are narrow at their base, and three long hanging stamina; the female flowers have the same empanment and petals as the male; and in the centre is situated a dissepiment germen, with nine reflexed spreading stigmas; the germen becomes a depressed round berry of one cell, including nine seeds, placed circularly. We have but one species in England, which grows wild on the mountains in Staffordshire, Derbyshire, and Yorkshire, where the soil is boggy; the heathrocks feed much upon the berries, which are called *heath berries*, or *crack berries*; and where these flourish are, there is generally plenty of these fowls. Miller.

HEATH, *hawthorn*. See *CORUS*.

HEATH, *sea*. See *BALEARENIA*.

HEATH, *prof.* See *Minor VETUS*.

HEATH-ACK. See *GRASS*.

HEATH, *mountain*. See *SAXIFRAGE*.

HEATHEN. See *PAGAN*.

HEATOTOTL, in Ornithology, the name of an American bird, described by Nieberberg, and called also *owenoti*. It is remarkable for a very large and round crest of whitish feathers on its head. Its breast is of a brownish grey; its belly white, and its feet yellow; its tail is round when expanded, and is variegated with black and white; its back and wings are black.

HEAVE, at Sea, signifies to throw away, or sling any thing over-board.

When a ship, being at anchor, rises and falls by the force of the waves, she is also said to *heave and set*.

To HEAVE a post. See *POST*.

To HEAVE at the capstan, signifies to turn it about. See *CAPSTAN*.

To HEAVE down. See *CAREENING*.

To HEAVE a flag already is to hang it out. See *FLAG*, and *SIGNAL*.

To HEAVE a-bow, is to make the ship advance by heaving in the cable, or other rope, which is fastened to an anchor at some distance before her. To *heave a-astern*, is to draw the ship backwards by the same operation.

To HEAVE the lead. See *SOUNDING*.

To HEAVE out, is to unfurl and throw loose a sail from the place where it had been rolled and stowed. The phrase is more particularly applied to the stay-sails; as, *loose the top-sails, and lower out the stay-sails*, which is done, in order to set or dry them.

To HEAVE short, is to draw so much of the cable into the ship, by means of the capstan or windlass, as that by advancing the will be almost perpendicularly above the anchor, and in a proper situation to set fast: and to *heave taut*, is to turn about the capstan, till the rope applied to it becomes taut, and ready for action.

HEAVE-up-sails, under the *Yankee* Law, were things offered up to God, by lifting them up on high.

HEAVEN, *Cælum*, an opaque, translucent orb, investing our earth; wherein the celestial bodies perform their motions.

The popular notion of *heaven*, it must be observed, has various ideas, in the language of philosophers, divines, and astronomers: agreeable to which, we may lay down divers *heavens*; as the *high*, or *empyrean heaven*; the *astral*, or *starry* heaven; the *planetary* heaven, &c.

HEAVEN, among Divines, called also the *empyrean heaven*, is the abode of God, and blessed spirits; as angels, and the souls of the righteous deposed.

In this sense, *heaven* stands opposite to *hell*.

This is also frequently called, in Scripture, the *kingdom of heaven*, the *heaven of heavens*, and by St. Paul the *third heaven*; sometimes *Paradise*, the *New Jerusalem*, &c.

This *heaven* is conceived as a place in some remote part of infinite space, wherein the Deity is pleased to afford a nearer and more immediate view of himself, and a more sensible manifestation of his glory; and a more adequate perception of his attributes, than in the other parts of the universe, where he is likewise present.

This makes what the divines also call the *heavenly vision*. Authors are much divided as to the reality of such *heaven*.

The inspired writers give us very magnificent descriptions of *heaven*, the structure, apparatus, and attendance thereof; particularly Isaiah, and St. John the Divine. Plato, in his *Dial. de Anim.* speaks of *heaven* in terms that bear so near a resemblance to those of Scripture, that Eusebius charges him with borrowing his account thence. De Prepar. Evangel. lib. xi. cap. 37.

The ancient Romans had a kind of *heaven* in their system of theology, which they called a *LYSVM*, or the *Æneas field*.

The Mahometan *heaven*, or *paradise*, is very gross, agreeable to the genius of their religion.

HEAVEN, among *Astronomers*, called also the *æthereal* and *starry heaven*, is that immense region wherein the stars, planets and comets, are disposed.

This is what *Moses* calls the *firmament*, speaking of it as the work of the second day's creation; at least it is thus the word *רָקִיעַ* is usually rendered by his interpreters; though somewhat absurdly, to countenance their own notion of the *heavens* being firm, or solid. The word, it is certain, properly signifies no more than *expanse*, or *extensile*; a term very well adapted by the prophet to the impression which the *heavens* make on our senses; whence, in other parts of Scripture, the *heaven* is compared to a curtain, or a tent stretched out to dwell in. The LXX. first added to this idea of *expanse*, that of *firm* or *solid*; rendering it by *קִיפָּה*, according to the philosophy of those times; in which they have been followed by the modern translators.

The later philosophers, as *Des Cartes*, *Kitcher*, &c. have easily demonstrated that *heaven* not to be solid, but fluid; but they still suppose it full, or perfectly dense, without any vacuity, and canonized out into many vortices.

But others carry the thing much farther, and overturn not only the solidity, but the supposed plenitude, of the *heavens*. *Sir Isaac Newton* has abundantly shewn the *heavens* void of almost all resistance, and, consequently, of almost all matter: this he proves from the phenomena of the celestial bodies; from the planets persisting in their motions without any sensible diminution of their velocity; and the comets freely passing in all directions towards all parts of the *heavens*.

Heaven, taken in this general sense, for the whole expanse between our earth and the remotest regions of the fixed stars, may be divided into two very unequal parts, according to the matter found therein; viz. the atmosphere, or *aerial heaven*, possessed by air; and the *æthereal heaven*, possessed by a thin, unresisting medium, called *æther*.

HEAVEN is more particularly used, in *Astronomy*, for an orb, or circular region, of the *æthereal heaven*.

The ancient astronomers assumed as many different *heavens* as they observed different motions therein. These they supposed all to be solid, as thinking they could not otherwise sustain the bodies fixed in them; and spherical, that being the most proper form for motion.

Thus we had seven *heavens* for the seven planets; viz. the *heavens* of the Moon, Mercury, Venus, the Sun, Mars, Jupiter, and Saturn.

The eighth was for the fixed stars, which they particularly called the *firmament*.

Ptolemy adds a ninth *heaven*, which he called the *primum mobile*.

After him two *CRYSTALLINE HEAVENS* were added, by *King Alphonsus*, &c. to account for some irregularities in the motions of the other *heavens*; and lastly, an *empyrean heaven* was drawn over the whole, for the residence of the Deity; which made the number twelve.

But others admitted many more *heavens*, according to their different views and hypotheses required. *Euclid* supposed twenty-three, *Clippus* thirty, *Regiomontanus* thirty-three, *Aristotle* forty-seven, and *Fracastor* no less than seventy.

We may add, that the astronomers did not much concern themselves whether the *heavens*, they thus allow of, were real or not, provided they served a purpose in accounting for any of the celestial motions, and agreed with the phenomena.

Among the other reveries of the rabbins, contained in the *Talmud*, we find it asserted, that there is a place where the *heavens* and the earth join together; that *rabbi Bar-chana*, going thither, laid his hat on the window of *heaven*; and that, going to take it again immediately after, it was gone, the *heavens* having carried it off; so that he must wait for a revolution of the orbs to bring it to its place again.

HEAVER, in *Sea Language*, is a name given by seamen to a wooden staff, which they employ as a lever on many occasions; particularly in setting up the top-mast shrouds, trappng the top-masts, stopping the larger blocks, seizing the standing rigging, &c.

HEAVINESS. See **GRAVITY**.

For the laws of the descent of *heavy bodies*, see **DESCENT**.

Heavy bodies do not tend precisely to the very centre of the earth, except at the poles, and the equator, on account of the spheroidal figure of the earth. Their direction is every where perpendicular to the surface of the spheroid.

HEAULME, or **HEAUME**, in *Heraldry*, a **HELMET**, or head-piece.

HEAVY, in the *Apocrypha. A horse is said to rest *heavy* upon the hand, who, through the softness of his neck, the weakness of his back, the weight of his fore-quarters, or through weariness, throws himself upon the bridle; but*

without making any resistance, or any effort, to force the horseman's hand. This fault is remedied, and the horse made light upon the hand, by stopping, and making him go back frequently, if it proceeds only from laziness and stiffness; but if caused by any defect in the back, there is no remedy for it.

HEBBING-WEAR, in our *Statutes*, is used for wears or engines made or laid at ebbing water, 23 Hen. VIII. cap. 5.

HEBDOME, *ΕΒΔΟΜΗ*, among the Athenians, a festival or holy day kept always on the seventh day of the moon in honour of *Apollo*; that being supposed to have been his birth-day.

HEBE, in *Ancient Mythology*, a goddess, the idea of whom, among the Romans, seems to have been much the same with that of eternal youth, or an immortality of bliss; agreeably to which, she is represented on a gem, in the great-duk's collection at Florence, with a young airy look, and drinking out of a little bowl; or, according to *Milton's* expression, "Quaffing immortality and joy." *Spence's Polymetis*, p. 189.

HEBENSTREITIA, in *Botany*, the name of a genus of plants, of the *dianthus angiosperma* class; the characters of which are these: the perianthium is of a tubular form; it consists of one leaf, lightly divided at the verge into two lips; the upper lip is short, straight, and narrow; the under is lanceolate, long, and bent downwards; the flower consists of one irregular petal; the tube is cylindrical and shorter than the cup; the lip is only one, not two, as in other labiated flowers; it is broad, and divided into four segments at the end, and is of the length of the under lip of the cup; the stamina are four filaments, two arising from each side of the lower part of the lip of the flower; the ovary of the pistil is oblong, the style is slender, and of the length of the flower, and the stigma is very thin; the fruit is an oblong capsule opening into two parts; the seeds are two in number, and are oblong, convex, and trifurcated on one side, and flat on the other.

HEBERMAN, in *Ancient Law Books*, a poacher, or a fisherman below London bridge: thus called, because he commonly fishes at ebb-water.

HEBERTHEFT, in *Ancient Customs*, a privilege of having the goods of a thief, and the trial of him, within a particular district.

HEBDOMADARY, **HEBDOMADARIUS**, or **HEBDOMARIUS**, a member of a chapter, or convent, whose week it is to officiate in the choir, to rehearse the anthems and prayers, and to perform the usual functions which the superiors perform at solemn feasts, and other extraordinary occasions.

The word is formed of the Greek *ἑβδομα*, which signifies the number seven; of *ἱερα*, *hier*.

The *hebdomadary* generally collates to the benefices which become vacant during his week; though it is usually looked on as an *abbacy*.

In cathedrals, the *hebdomadary* was a canon or prebendary, who had the peculiar care of the choir, and the inspection of the officers of his week.

In monasteries, the *hebdomadary* is he who waits at table for a week, or other stated period; directs and assists the cook, &c.

In church-antiquity, we meet with accounts of nine different sorts of *hebdomadaries*; viz. the *hebdomadarius cantor*, or *hebdomadary cantor*; *hebdomadarius chori*, *hebdomadary of the choir*, which two were really the same; viz. he who led or conducted the public service; *hebdomadary of the kitchen*, *hebdomadarius coquinae*; *hebdomadary of the deputed*, or the dead, *hebdomadarius defunctorum*, he who took care of the office and service of the dead; *hebdomadarius invitatori*, he who sung the invitatory; *hebdomadarius litter ad mensam*, who he read at meal time; *hebdomadarius majore missæ*, he who read mass; *hebdomadarius psalterii*, who probably was the same with the *hebdomadarius chori*; and *hebdomadarius sacri altaris*, who might be the same with the *hebdomadary of the high mass*.

HEBRAICA cæcis, in *Natural History*, a name given by authors to a very beautiful sea-shell of the *voluta* kind, from a number of black marks which seem to resemble the Hebrew characters.

HEBRAISM, an idiom, or manner of speaking, peculiar to the Hebrew tongue.

There is no understanding even the versions of the Old Testament, without some acquaintance with the Hebrew; they are so full of *Hebraisms*.

We have abundance of *Hebraisms* borrowed from Scripture, and naturalized in our own language; as, *Sin of perdition*; *to jump in the Lord*, &c.

HEBREW, something relating to the people of the Jews, i. e. the twelve tribes, descending from the twelve patriarchs, sons of Jacob. See **JAWI**. Thus we say,

HEBREW BIBLE. See **BIBLE**.

HEBREW character. There are two kinds of Hebrew characters: the *ancient*, called also the *square*; and the *modern*, or *rabbinical* characters. The *square Hebrew* takes its denomination from the figure of its characters, which stand more square, and have their angles more exact and precise than the other.

This character is used in the text of holy Scripture, and their other principal and most important writings. When both this and the rabbinical character are used in the same work, the former is for the text, or the fundamental part; and the latter for the accessory part; as the gloss, notes, commentaries, &c.

The best and most beautiful characters of this kind, are those copied from the characters in the Spanish manuscripts; next, those from the Italian manuscripts; then those from the French; and lastly, those of the Germans, whose characters are much the same, with respect to the other genuine *square Hebrew* characters, that the Gothic, or Dutch characters, are with respect to the Roman.

Several authors contend, that the *square* character is not the real ancient Hebrew character, written from the beginning of the language to the time of the Babylonish captivity; but that it is the Assyrian, or Chaldean character, which the Jews assumed, and accustomed themselves to, during the captivity, and retained afterwards.

They say, that the Jews, during the captivity, had quite disused their ancient characters; so that Ezra found it necessary to have the sacred books transcribed into the Chaldean square character. These authors add, that what we call the *Samaritan* character, is the genuine ancient Hebrew.

Of this opinion are Scaliger, Bochart, Cysaubeon, Vossius, Grotius, Walton, Capellus, &c. and among the ancients Jerome and Eusebius. On this side it is urged, that the present characters are called Assyrian by the ancient Jewish writers of the Talmud, and, therefore, must have been brought from Assyria; but to this argument it is replied, that there were two sorts of characters anciently in use, viz. the sacred, or present square character; and the profane or civil, which we call Samaritan; and that the sacred is called Assyrian, because it first began in Assyria to come into common use. It is farther alleged, that the Chaldean letters, which the Jews now use, were unknown to the ancient Jews before the captivity, from Dan. i. 4. Moreover, it is inferred from 2 Kings, xiii. 18, whence we learn that a Jewish priest was sent to teach the Samaritans the worship of Jehovah; on which occasion he must have taught them the law; and yet no mention occurs of his teaching them the language or character, that the law was then written in the character which the Samaritans used. But the chief argument is taken from some ancient Jewish books, with a legend on one side, "The shield of Israel;" and on the other "Jerusalem the holy," both in Samaritan characters. These shields, it is said, must have been coined before the division of the two kingdoms of Judah and Israel, or, at least, before the Assyrian captivity, because the Samaritans never afterwards reckoned Jerusalem holy. On the other side, or for the primitive antiquity of the square character, are the two Buxtorfs, Leusden, Calovius, Hottinger, Spanheim, Lightfoot, &c. They urge, from Matthew v. 18, that *not* is really the least of the consonants in the present Hebrew, whereas it is one of the largest characters in the Samaritan alphabet: but Walton replies, that if our Saviour here speaks of the least letter of the alphabet, we can only infer, that the Chaldean character was used in our Saviour's time, which is not denied by those who maintain the Samaritan to be the original. They also allege, that the Jews were too obdurate and superstitious to allow their sacred character to be altered; but if this was done under the direction and authority of Ezra, the argument will be much invalidated. Farther they say, that Ezra could not alter the ancient character, because it was impossible to make the alterations in all their copies. This argument, however, is contradicted by fact; since the old English black letter is actually changed for the Roman. They say, likewise, that Ezra was not disposed to profane the sacred writings with a heathen character: but this supposes that Ezra was so superstitious as to imagine, that there was some peculiar sanctity in the shape of the letters. Moreover, the advocates for this opinion appeal to ancient coins found in Judaea, with a legend in the Chaldean or Assyrian character. But the genuineness of these coins is much suspected.

The learned Jewish Societie maintains, with great address, that the ancient Hebrew character is that found on the medals of Simon, and others, commonly called *Samaritan medals*; but which, he asserts, were really *Hebrew* medals, struck by the Jews, and not the Samaritans. Buxtorf endeavours to reconcile these two opinions, by

producing a variety of passages from the rabbies to prove; that both these characters were anciently used; the present square character being that in which the tables of the law, and the copy deposited in the ark, were written; and the other character being used in the copies of the law, which were written for private and common use, and in civil affairs in general; and that after the captivity, Ezra enjoined the former to be used by the Jews on all occasions, leaving the latter to the Samaritans and apostates. But it can hardly be allowed by any who consider the difference between the Chaldean and Samaritan characters, with respect to convenience and beauty, that they were ever used in the same time. After all, it is of no great moment which of these, or whether either of them, were the original characters; since it appears, that no change of the words has arisen from the manner of writing them, because the Samaritan and Jewish Pentateuch almost always agree after so many ages. It is most probable that the form of these characters has varied in different periods; this appears from the testimony of Montfaucon, in his *Hexapla Origenis*, vol. i. p. 40. &c. and is implied in Dr. Kennicott's making the characters in which manuscripts are written, one sort of their age. See Jennings's *Art.* vol. ii. p. 316; and the authors there cited. Kennicott's *Diss.* on the *Hebrew Text*, vol. i. and ii.

HEBREW character, modern, or rabbinical, is a good neat character; formed of the *square Hebrew*, by rounding it, and retrenching most of the angles, or corners of the letters, to make it the more easy and flowing. The letters used by the Germans are very different from the rabbinical character used every where else, though all formed alike from the square character; but the German in a more slovenly manner than itself.

The rabbins frequently make use either of their own, or the *square Hebrew* character, to write the modern languages in. There are even books in the vulgar tongues, printed in *Hebrew* characters; instances whereof are seen in the French king's library.

HEBREW language, called also absolutely **HEBREW**, is the language spoke by the *Hebrews*, who were so called, as is most probable, from Heber the son of Shem, wherein all the books of the Old Testament are written; whence it is also called the *holy* or *sacred language*.

There is no piece in all antiquity, written in pure *Hebrew*, beside the books of the Old Testament; and even some parts of these are in *Chaldee*.

The *Hebrew*, then, appears to be the most ancient of all the languages in the world; at least it is so with regard to us, who know of no older. Some learned men will have it the language spoken by Adam in paradise; and that the fables will speak it in heaven; alleging, that it is so concise and yet so significant, so poetic and yet so free from leishy, or bombast, as of all languages to approach nearest to that of spirits, who need no words for conveying their ideas to each other. Dr. Sharpe adopts the opinion, that the *Hebrew* was the original language; not indeed that the *Hebrew* is the unvaried language of our first parents, but that it was the general language of men at the dispersion; and however it might have been improved and altered from the first speech of our first parents, it was the original of all the languages, or almost all the languages, or rather dialects, that have since arisen in the world. *Origin, &c.* of Languages, p. 22, &c. See **LANGUAGE**.

The *Hebrew*, such as we have it in the holy Scripture, is a very regular, unlogical language, and is particularly so in its conjugations. Properly speaking, there is but one simple conjugation; but this is varied in each verb seven or eight different ways, which has the effect of so many different conjugations, and affords a great number of expressions, whereby to represent, under one single word, all the different modifications of a verb, and several ideas at once; which in the modern, and most of the ancient and learned languages, are expressible only by phrases.

The original or primitive words in their language, which they call *radices*, *roots*, rarely consist of more than three letters, or of two syllables, which are expressed by two sounds, or by the same sound redoubled, which is indicated by a point.

There are twenty-two letters in the *Hebrew* language, which grammarians divide into *gutturals*, *palatals*, *dental*, *labial*, and *lingual*. This division is taken from the several organs of speech; some whereof contribute more than others to the pronunciation of certain letters.

Usually, they only reckon five vowels in the *Hebrew*, which are the same with ours, viz. *a, e, i, o, u*; but then each vowel is divided into two, a long, and a breve, or short; the sound of the former is somewhat graver, and longer; and that of the latter shorter, and more acute. It must be added, that the two last vowels have quite different

different sounds; different, we mean, in other respects besides quantity and degree of elevation.

To these ten or twelve vowels must be added some others, called *semi-vowels*, which are only slight motions serving to connect the consonants, and make the easier transitions from one to another.

The number of accents is prodigious in the *Hebrew*. Some reckon near forty different ones; and others reduce their number to thirty, and even lower; and of these there are several whose use is not well ascertained, notwithstanding all the inquiries of the learned into that matter.

In the general, we know these three things: 1. That they serve to distinguish the sentences, and the members thereof, like the points and commas, &c. in English. 2. To determine the quantity of the syllables; and, 3. To mark the tone wherewith they are to be spoke or sung. It is no wonder, then, that there should be more accents in the *Hebrew* than in other languages; as they do the office of three different things, which, in other languages, are called by different names. See ACCENTS.

As we have no *Liberty* but what is contained in the Scripture, that language to us wants a great many words; not only because in those primitive times the languages were not so copious as at present; but also on this account, that the inspired writers had no occasion to mention many of the terms that might be in the language.

the Chaldean, Syriac, Ethiopic, &c. languages, are by some held to be only dialects of the *Hebrew*; as the French, Italian, Spanish, &c. are dialects of the Latin. It has been supposed by many very learned men, that the *Hebrew* characters or letters were often used hieroglyphically, and that each had its several distinct sense understood as a hieroglyphic. Neuman, who seems to have taken infinite pains to find out this secret meaning of the letters, gives the following explanation: *א* *aleph*, he says, is a character denoting motion, readiness, and things; *ב* *bet*, signifies, 1. matter, body, substance, thing; 2. Place, place, or capacity. And, 3. In, within, or contained; *ג* *gimel*, stands for flexion, bending, or obliquity of any kind; *ד* *daleth*, signifies any protrusion made from without, or any promotion of any kind; *ה* *he*, stands for preience, or demonstrative efficacy of any thing; *ו* *vau*, stands for copulation or growing together of things; *ז* *zain*, expresses vehement protrusion and violent compulsion, such as is occasioned by at once violently discharging and confining a thing together; it also signifies, sometimes, the flattening of any figure into a narrow point at the end; *ח* *chet*, expresses addition, society, or any kind of composition, or combination of things together; *ט* *eth*, stands for the withdrawing, drawing back, or recede of any thing; *י* *yod*, signifies extension and length, whether in matter or in time; *כ* *cap*, expresses a turning, curvedness, or contrary; *ל* *lamed*, stands for an addition, access, impulse, or advection, and sometimes for preface; *מ* *mem*, expresses amplitude, or the amplifying any thing in whatever manner; in regard to continuous qualities, it signifies the *extending* length, breadth, and circumference; and the distinct qualities it signifies multitude; *נ* *nun*, signifies the propagation of one thing from another, or of the time thing from one person to another; *ס* *samech*, expresses circumscription and coarlescence; *ע* *ain*, stands for observation, objection, or observation; *פ* *pe*, stands for a crookedness or an angle of any figure; *צ* *tsade*, expresses contiguous and close succession; *ק* *qaph*, expresses a circle or ambit; *ר* *resh*, expresses the excess of any thing, as also the exterior part of a thing, and the extremity or end of any thing; *ש* *shin*, signifies the number three, or the third degree, or the utmost perfection of any thing; *ת* *tau*, expresses a figure, continuation, or succession of any thing.

According to this explication, as the several particular letters of the *Hebrew* alphabet separately signify the ideas of motion, matter, space, and the several modifications of matter, space, and motion, it follows, that a language, the words of which are composed of such expressive characters, must necessarily be of all languages the most perfect and expressive; as the words formed of such letters, according to their determinate separate significations, must convey the idea of all the matters contained in the sense of the several characters, and be at once a name and a definition, or succinct description of the subject, to which they are applied, and as every object, as well in the natural and moral world, must be known as soon as its names are known, and their separate letters considered.

The words URIM and THUMMIM are thus easily explained, and found, perhaps, the most apposite and expressive words that were ever formed.

HENREW, *rabbinical*, or *modern HENREW*, is the language used by the rabbins, in the writings they have composed.

The base, or body hereof, is the *Hebrew* and *Chaldee*, with others alterations in the words of these two languages, the meanings whereof they have considerably enlarged and extended. Abundance of things they have borrowed from the *Arabic*: the rest is chiefly composed of words and expressions, chiefly from the *Greek*; some from the *Latin*; and others from the other modern tongues; particularly that spoken in the place where each rabbin liveth or wrote.

The *rabbins Hebrew* must be allowed a very copious language. M. Simon, in his *Hist. Crit. du Vieux Testament* liv. in chap. 27, observes, that there is scarce any art, or science, but the rabbins have treated thereof in it. They have translated most of the ancient philosophers, mathematicians, astronomers, and physicians; and have wrote themselves on most subjects: they do not want even orators and poets. Add, that this language, notwithstanding it is crowded with foreign words, has its beauties visible enough in the works of those who have written well in it.

Mr. Simon, 1794, it is impossible to reduce it into an art, or system of rules; but several learned men are of another sentiment; and it not only appears possible, but has actually been performed. Gersondus first attempted it in his *Horae Rabbinicae*, which yet goes no farther than the learning to read it. Bussett seconded him, at the end of his *Horae Rabbinicae*; where we have an additional piece, under the title *Lectionis Hebraeo-Germanicae Uti et Exercitii*. Others have gone yet farther: Maim has lately given us a rabbinical grammar, at Gießen, under the title of *Johnannis Maim Grammatica Rabbinica*; and before him Sennert had done the same; *Rabbinicae*: b. e. *Præcepta Targumicae Talmudico-Rabbinicae*. Wirtenb. an. 1606.

HEUREUX *point* or *point*. See POINTS.

HEBREWS, *Epistle to the*, a canonical book of the New Testament, bearing no writer's name, but generally ascribed to the apostle Paul. Concerning the date of this epistle, and occasion of writing it, see **EPISTLE**.

HECATE, in *Mithology*, a name of the infernal Diana, represented with all the characteristics of a fury, holding instruments of terror in her hands, and grasping either cords, or swords, or serpents, or flaming torches. Under this character she was exhibited with three bodies, and invoked in enchantments.

HECATOMB, HECATOMBE, in *Antiquity*, a sacrifice of a hundred beasts of the same kind, at a hundred altars, and performed by a hundred priests, or sacrificers.

The word is formed of the Greek *ἱεράειν*, which properly signifies a *sumpsture*, or magnificent *sacrifice*. Others derive it from the Greek *ἑκατόν*, *centum*, a hundred, and *βου*, *bo*, *bullock*, &c. On which footing the *hecatomb* should be a sacrifice of a hundred bullocks. Others derive the word from *λατύν*, and *ωσ*, *ποι*, *fact*, and on that principle hold, that the *hecatomb* might consist of only twenty-five four-footed beasts. They add, that it was of no importance what kind of beasts were chose for victims, provided the quota of feet were but had.*

Pythagoras is said to have sacrificed a *hecatomb* to the Muses, of a hundred oxen, in joy and gratitude for his discovering the demonstration of the 47th proposition of the first book of Euclid, viz. that in a rectangled triangle, the square of the hypothenuse is equal to the squares of the two other sides.

For the origin of *hecatombæ*. Strabo relates, that there were a hundred cities in Laconia; and that each city used to sacrifice a bullock every year, for the common safety of the country; whence the institution of the celebrated sacrifice of a hundred victims, called *hecatombæ*. Others refer the origin of *hecatombæ* to a plague, where-with the hundred cities of Peloponnesus were afflicted; for the removal whereof, they jointly contributed to fo *hecatombæ* a sacrifice.

Julius Capitolinus relates, that for a *bestiarii* they erected a hundred altars of turf, and on these sacrificed a hundred sheep, and a hundred hogs. He adds, that when the emperors offered sacrifices of this kind, they sacrificed a hundred lions, a hundred eagles, and a hundred other beasts of the like kind.

HECATOMBAION, in *Chemistry*. See **ECATOMBAION**.
HECATOMPHONIA, *Exatompnia*, an ancient sacrifice among the Mæcenians; offered by such as had slain a hundred enemies in battle.

The word comes from *leaver*, a *hundred*, and *potter*, to *kill*.

HECATONSTYLON, 'ἑκατόνστολον, in the *Ancient Architecture*, a porch with a hundred columns. This designation was peculiar to the great porch of Pompey's theatre at Rome.

HECK, among *Hufbandmen*, a rack, at which horses are fed with hay.

It is also used as the name of an engine, wherewithal to take

take fish in the river Ouse. A salmon *beck* is a grate for the catching that sort of fish. See *Salmon-Fishing*.
Hece also **HECCAGIUM**, or **HECCAGIUM**, which occurs in ancient records, for a rent paid the lord for the liberty to use such engines.

HECKLE, among *Hemp-Drifters*. See **HATCHEL**.

HECKLING of *Hemp*. See **HEMP**.

HECTIC, or **HECTIC FEVER**, in *Medicine*, a sort of low habitual fever, seated in the solids, and gradually plying on and consuming the substance thereof.

The word is *verruet*, formed of *hectis*, a quality hard to separate from its subject.

A *hectic* is an usual attendant of a CONSUMPTION, and is reputed one of the diagnostic signs thereof.

The *hectic*, according to Dr. Quincy, is the reverse of those fevers which arise from the plethora, or too great a fulness: this being attended with too lax a state of the excretory passages, and particularly those of the skin, whereby too much runs off, as leaves not resistance enough in the contractile vessels to keep them sufficiently distended, so that they vibrate often, agitate the fluids more, and keep them thin and hot.

The symptoms of this disease distinguish it from the *febris lenta*, or *slow fever*, which is often confounded with it, are these: a perpetual dry burning in the flesh, which is most sensible in the hands after eating; a weak, low, and quick pulse; the return of a chilliness in the middle of the fever; a thick orange-coloured urine, with a pale red sediment, with a thin fatth cuticle upon it, and a strong smell, though the urine is so various, that nothing can be ascertained from its appearance; a languid habit of body, and a particular love of all cold meats; a dryness of the mouth, with continual thirst, and a frothy or glaucous spittle; unquiet sleep, not at all refreshing to the patient; a faccidie and continual wasting and emaciation of the body, a loss of strength, a languor of the mind, a sense of a weight and pain in one of the hypochondria, a sensibility of the lightest changes in the weather, and a continual growing worse at the greater changes which happen at the equinoxes; a vertiginous and dozing swimming in the head when the patient gets up, and in the latter stages of the disease colligative sweats; and finally, the scene is closed by a diarrhoea, and the facies Hippocratica, which is seen in no other disease so remarkably as in this and a consumption. A cough is no necessary consequence of a *hectic*, but it usually attends it, and arises from some conjunct cause.

Persons subject to it. Men are much more liable to fall into *hectic* than women; and of those principally such as are of a tender constitution and dry habit, and are violently addicted to the passions, and live high, eating seasoned food, and drinking large quantities of wine or other strong liquors; and such as have exhausted their strength and spirits by violent exercises, long watching, great study or thoughtfulness, want of nourishment, excessive venery, or by taking repeated doses of strong purgative medicines. Persons often fall into this disease also by omitting habitual bleedings and other evacuations, and by stopping customary discharges of blood by the hemorrhoidal veins, or other ways, by the taking astringent medicines; but more persons are thrown into *hectic* by injudicious treatment in fevers, than fall into them by all their other ways together, and especially by the bad treatment of intermittents. Lying in women, and those in whom the menses cease, are liable to this disorder; as well as all persons, of either sex, whose glands are disordered, or who are afflicted with abscesses or ulcers in the internal parts. The matter of these ulcers, absorbed into the blood, occasions a fever more or less violent.

Prognosis in it. When a *hectic* is confirmed and of some standing, it is in vain to attempt the cure of it; for when one of the viscera is ulcerated, nature will always bring on this fever to endeavour to abridge it; and as the cause never can be removed, the symptoms never will cease.

All that can be expected from medicine in these cases, is the mitigating the symptoms, and putting off the fatal period longer than it would naturally have happened. Younger people are much more suddenly destroyed by *hectic*, and are much more subject to them, than those more advanced in years; hence, from eighteen to five-and-thirty may be accounted the period of life most subject to danger from this disease; it is usually sudden in its declaration between these periods, afterwards if people fall into it, it becomes chronic, and they bear it a long time. The changes of the seasons are dangerous times for *hectic* people, but most of all the autumnal equinox, and so also the climacteric years. Young persons, first seized with *hectic* in spring, usually die in the autumn following; and those who are first seized with it

in the summer solstice, usually live till the same season of the following year. A discharge of blood by the hemorrhoidal veins in the last stages of a *hectic* usually hastens the death of the person, but in the beginning of the disease the same evacuation often proves a cure.

Method of treatment. The viscid humours collected in the prime viæ are to be attenuated by tartarum vitriolatum and the neutral salts, and the bowels to be kept gently open by clysters and small doses of magna and the other gentler cathartics; next the acrimony of the ulcerous matter is to be subdued by the absorbents fixed with vegetable acids, as by the crab-claws fixed with lemon juice; by coral, oyster-shells, and the like retentive substances, fixed in the same manner; decoctions of pimpernel and of hawthorn with daffy-flowers are also very ferriculous; a mixture of spirit of hawthorn and tincture of anniseed, and powders of coral and diaphoretic antimony, are to be given twice or oftener in a day. Small doses of scorax-pill will mitigate the cough, and emulsions of almonds, with a small mixture of lemon-juice, will greatly abate the hectic heat. During the whole time the diet must be nourishing, and jellies, strengthening pultices, and milk food, are to be taken. Junker's Comp. Med. 387 and 390.

But these medicines are not to be continued in an uninterrupted course, nature is to be sometimes eased of such a burden; and, in fine, the more the disease inveterates, the fewer medicines are to be given, as these grow less and less hope of benefit from them.

If a cough attends a *hectic*, great relief is usually found from a tincture of oil of sweet almonds and syrup of popple; or liquid ludanum may be occasionally given in small doses. The cough may be sometimes appeased by bleeding, and the expectoration promoted by pills formed of fresh squills, gum ammoniac, and powdered cassia-seed, of each a quarter of an ounce; four or five of these, made of a moderate size, may be taken twice or thrice a day. The milk of gum ammoniac and vegetable acids, as apples, oranges, lemons, &c. are proper medicines. The colligative sweats which attend this disease are not to be cured by suppressing them violently, but the patient is to keep himself moderately cool, and to take powders of coral, terra Lemnia, and the other absorbents, and a grain of opium may be added to the quantity of three or four doses. Whey and the cooling emulsions also have their good effects. Gum Arabic, added in moderate quantities to these emulsions, also is of great use in checking the diarrhoea which often attends *hectic*; and conserve of red roses with chalybeated milk are to be taken constantly to mitigate this symptom; and when it is more violent, a dose of diacordium dissolved in cinnamon water often proves a very efficacious medicine; and when the violence of the purging is once stopped by this, it will be kept from returning by the other methods. Heister's Comp. Med. p. 115.

The loss of appetite which usually attends these cases is to be remedied by bitters, such as tinctures of orange-peel and cortex cinchona, to which may be added a small quantity of the felsula bark; and to these a small quantity of spirit of sulphur or of vitriol may be added, the more immediately to excite the appetite.

When there is reason to apprehend that an imposthume is formed in the breast, recourse must be had to the Peruvian bark. Sir John Pringle observes, that he found nothing diminish the *hectic* fire so much as small but repeated bleedings, accompanied with saline draughts and cooling diet. Dr. Hulse recommends fixed air in *hectic* fevers, attended with pulmonary complaints. For the manner of administering it, see *PERIT FEVER*. But more depends on exercise, particularly riding, air, and diet, than on medicine. The diet should be chiefly vegetables and milk.

A milk diet is much recommended in *hectic*, and particularly asses milk, as being the least viscid and heavy of any kind; but it should be used fresh, and in sufficient quantities, to the amount of half a pint three or four times a day, and duly perfused in. When it happens to purge, it may be mixed with old conserve of roses, or powder of crab-claws.

Dr. Barnard proposes butter-milk as a succedaneum to asses milk. According to him, it answers most of the indications in this case, as it cools moistens, nourishes, &c. He adds, that he has known many persons cured of obstinate *hectic* only by a continued use thereof. This should be used sparingly at first, and the quantity gradually increased, till it becomes almost the only food. Though much may be expected from a milk and vegetable diet, regular exercise, and wholesome air, in the first stages of a consumption, yet those who have been accustomed to animal food and strong liquors must make the change by degrees; and if they have strength and sufficient resolution to persist in this course, they will

seldom be disappointed of a cure. *Buchan's Dom. Med.* p. 185. ed. 1776.

HEDAGIUM, anciently signified a toll or custom, paid at the hythe or wharf, &c. for landing merchandize, goods, &c.

The word is formed from *hedra*, a *hythe*, *port*, or *wharf*. From such toll, or customary duty, exemptions were sometimes granted by the sovereign to particular persons and societies.

HEDERA, *ivy*. See *IVY*.

HEDERA terrestris. See *GROUND-IVY*.

Larixma Hedera. See *IVY*.

HEDERALSIS, in *Botany*, a name used by Ruellius, and some other authors, for the plant called by others *ajacida* or *swallow-wort*.

HEDERARIUS plexus, a sort of reticular plexus formed by the spermatic vein and artery in their progress to the testicles.

HEDGE, in *Agriculture*, &c. a fence inclosing a field, garden, or the like, made of branches of trees interwoven.

The word is formed of the German *hege* or *hege*, or the Anglo-Saxon *hege*, or *hege*, which signifies simply *inclosure*, *circumference*.

HEDGE, *quickset*, is that made of quick or live trees, which have taken root, in contradistinction to that made of *faggots*, *hurdles*, or dry boughs, &c.

The hawthorn is allowed the best of all the English shrubs for quickset hedges. The best method of raising this for use, is to put the haws into the ground as soon as ripe, and cover them with earth, and by the spring twelvemonth the young shoots will be of a due size to transplant from the seed-pot into hedge-rows. The crab-tree is a common mixture with the hawthorn in hedges; but it grows faster than the hawthorn, and requires cutting to keep the hedge even. The young hawthorns raised from seed always thrive better than those picked up wild in the fields.

The great consideration in making quickset hedges is to bring the plants from a woody soil than that in which it is intended to fix them. They must be about the thickness of a goose-quill, well-rooted and strong, and must be planted about four or five inches out of the ground. If there be a ditch to the hedge, it should be six feet wide at the top, one and a half at the bottom, and three feet deep.

If the bank be without a ditch, the plants should be set in two rows, at a foot distance below one another. The turf is to be laid, with the grass-side downward, on that side of the ditch on which the bank is designed to be made, and some of the best mould must be laid upon it to bed the quick; then the quick is to be laid upon it a foot asunder, so that the end of it may be inclining upwards; and, at equal distances of thirty feet, plant an ash, oak, crab, or elm, to grow with the quick. When the first row of quick is laid, it must be covered with mould, and the turf laid upon it as before, and some more mould upon that; so that, when the bank is a foot high, another row of sets may be laid against the space of the lower quick. These must be then covered as the former, and the bank is to be then topped with the bottom of the ditch, and a dry or dead hedge laid to shade the under plantations. There should then be flakes driven into the loose earth quite down to the firm ground, at about two feet and a half distance from each other; oak flakes are accounted the best of all for this use, and the next to these of black-thorn or willow. Small bushes are to be laid below, but not too thick, only to cover the quick from being injured as it shoots.

The young plants must be constantly weeded, and great care must be taken to preserve them from the bitings of cattle, especially of sheep. If they have been cropped, or are not found to grow well, it is a good custom among the farmers to cut them down in February to the ground, or within an inch of it, for after this they usually send out new roots, and shoot very vigorously.

When the hedge is of eight or nine years growth, it may be plashed or laid down, by giving the shoots or branches a cut with a knife or a bill half through, and then weaving them about the flakes, and trimming off the small superfluous branches. See *PLASHING*.

The crab, black-thorn or haw, and holly, are sometimes planted for hedges. See *FENCE*.

Instead of building a garden wall facing the north-east, Mr. Lawrence advises, that to save charge, &c. a crab-tree hedge of three rows be planted, which will be a good mound, and quickly grow up to be a better fence than a wall against the west and south-west winds, which make the greatest destruction in a garden, and which blow two parts in three of the whole year; besides the flock of fruit such a hedge, grafted with red-brake or gooseberry, will yield.

Hege for ornament in gardens, are sometimes planted with evergreens, in which case the *HOLLY* is preferable to any other. Next to this, most people prefer the *YEW*, on account of its growing very close; but the dead colour of its leaves renders these *hedges* less agreeable. The *LAUREL* is one of the most beautiful evergreens, but the shoots are so luxuriant, that it is difficult to keep it in any tolerable shape; but *hedges* that are formed of laurel, which has large leaves, should be pruned with a knife, cutting the shoots just down to a leaf; and this method is much better than that of cutting them with shears. The *laurestinus* is also a very fine plant for the purpose of ornamental *hedges*; but this is liable to the same objection as the laurel: it ought, therefore, to be pruned with a knife, in April, when the flowers are going off; but the new shoots of the same spring must by no means be touched. The small-leaved and rough *laurestinus* are the best plants for this purpose. The tree *RAUEN* is the next best plant for *hedges*, which may be led up to the height of ten or twelve feet, and if they are kept narrow at the top, that the trees may not have room to lodge upon them, they will become close and thick, and make a fine appearance. The *elm*, or evergreen oak, is also planted for *hedges*, and is a fit plant for those that are designed to be very tall. The deciduous trees, which are usually planted to form *hedges* in gardens, are the hornbeam, which may be kept neat with less trouble than most other plants; the beech; and the small-leaved English elm, which should not be planted closer than seven or eight, or even ten feet: the lime-tree has also been recommended for this purpose; but, as *hedges* thus formed become thin at bottom, and the leaves turn of a black disagreeable colour, it is now disused. The alder is frequently used for *hedges*; and, where the soil is moist, it is preferable to any of the deciduous trees, because its leaves are of a lively green till late in autumn, and when they decay their litter is soon over. Many of the flowering shrubs have been planted for *hedges*, such as roses, honey-suckles, sweet-brier, &c. but these are difficult to train; and if they are cut to keep them within compass, their flowers, which are their greatest beauty, will be entirely destroyed. However, these *hedges* are by no means to be recommended for pleasure-gardens, either as ornamental or useful. Miller.

By 43 Eliz. cap. 7, *hedge-breakers* are bound to pay such damages as a justice of the peace shall think fit; and if not able to pay, they shall be committed to the gaol to be whipped. And *hedge-thefters* may be apprehended, and the justice shall adjudge a penalty, not exceeding 10s. to the poor, or, in want of payment, they shall be sent to the house of correction for a month. 15 Car. II. cap. 2. And persons convicted of buying stolen wood shall forfeit treble the value.

HEDGES, *spallier*. See *SPALLIER*.

To *line a Hedge*, in *Military Affairs*, is to plant musketeers along it, under cover; either to fire upon an enemy that is advancing, or to save themselves from the host, or to defend a pass or defile.

HEDGE, *leg*. See *HEDGE-HOG*.

See HEDERA, &c.

See CISTANTHIA and **EPHEDRUM**.

HEDGE, *leg*, in *Botany*. See *Small TREES*.

HEDGE, *leg*, *quince*, in *Botany*. See *LUCERNE*.

HEDGE, *leg*, *quince*, a name sometimes given to a distinct genus of plants, called by authors *CACTUS*. See *Moss* *TRITILE*.

Spanish Hedge, *leg*, *quince*, in *Botany*. See *LADY'S FINGER*.

HEDGE, *leg*, *quince*. See *HEDGE-HOG*.

HEDGE, *leg*, is also a name sometimes given to a distinct genus of plants, called by botanists *DICHTALIS*. See *FOX-GLOVE*.

HEDGE, *leg*, the name of a genus of plants, known among botanists by that of *HYSSOPUS*. See *HEDGE-MUSTARD*.

HEDGE, *leg*, a name sometimes given to a genus of plants, called by botanists *GALOPHYS*. See *SHRUBBY HEDGE*.

HEDGE, *leg*, a name by which some call the *prunus*, a distinct genus of plants. See *SHRUBBY HEDGE*.

HEDGE, *leg*, the English name of a species of *metastichus*. See *HEDGE-SUCKER*.

HEDYUNDA, in *Botany*. See *Belladonna*.

HEDYOSMOS, of *plants*, and *quince*, *leg*, in *Botany*, a name given by some writers to *mint*, because of its sweet smell.

HEDYOTIS, in *Botany*, a genus of the *tetranebris* *conjugata* class. The corolla has a single petal and is funnel-shaped; and the fruit is a two-valved capsule, containing many seeds.

HEDYSON, in *Botany*. See *HYOSCYAMUS*.

HEDYSARUM, in *Botany*. See *Fresh HONEY-SUCKLE*.

HEEL, in *Anatomy*, the hind part of the *FOOT*.

In winter, the *hoof* are liable to a kind of chilblains called *hibes*, which sometimes tend to a mortification. The bone of the *heel* is called *calcaneum*.

HEEL of a *horse*, is the lowest hind part of the foot, comprehended between the quarters and opposite to the toe. The *heel* should be high and large, and one side not rise higher on the pattern than the other. The disempers incident to this part are *scabbiness* and *scratches*.

Some narrow-shod horses have high *heels*, but so weak and tender, that by pressing the two sides of the *heel* one against another they will sensibly yield. See *Hoof*.

To *open the HEELS*, is to pare the foot and cut the *heel* low, almost close to the flesh; taking it down within a finger's breadth of the coronet or top of the hoof, so as to separate the quarters, and by that means weaken and take away the substance of the foot, and make it close and become narrow at the *heel*.

HEEL of a *horseman*. This being the part which is armed with a spur, the word is used for the spur itself; as, this horse understands the *heel* well.

To *ride a horse from one HEEL to another*, is to make him go sideways, sometimes towards one *heel*, and sometimes another.

HEEL, among *Carpenters*, denotes an inverted *angle*.

HEEL, in *Sea-language*, is a name often given to the after-end of a ship's keel; and also to the lower-end of the stern-post, to which it is firmly joined.

If a ship lean on one side, whether aground or aloft, they say the *heel* is starboard or port, or the *heel* offward or to the shore; that is, the inclines more to one side than to the other.

HEEL of a *mail*, is that part of the foot thereof which is paved away flanting, that the *MAST* may be flayed afterward on it.

HEEL of a *top-mast*, is the lower end, fastened on the trussel-tree by means of an iron bar, called the *FIDD*.

HEELER, or *Bloody-HEEL* *Cock*, is a fighting cock which strikes of wounds much with his spurs.

The masters know such a cock, even while a chicken by the striking his two *heels* together in his going.

HEGEMONE, in *Mythology*, one of the *GRACES*. See *AUXO*.

HEGIRA, in *Chronology*, a celebrated epocha, used by the Arabs and Mahometans for the computation of time.

The word is Arabic, formed of هجرة, *hijra*, flight; of هجر, *to fly, to quit one's country, family, friends, &c.* The event which gave occasion to this epocha, was Mahomet's flight from Mecca. The magistrates of that city, fearing his importunities might raise a sedition, resolved to expel him: this, accordingly, they effected in the year of our Lord 622, on the evening of the 12th or 16th of July.

To render this epocha more creditable, the Mahometans affect to use the word *hijra* in a peculiar sense, for an act of religion, whereby a man forsakes his country, and gives way to the violence of persecutors and enemies of the faith: they add, that the Coraschites, being then the strongest party in the city, obliged their prophet to fly, as not being able to endure his abolishing of idolatry. This flight was not the first of Mahomet's, but it was the most famous. It happened in the fourteenth year from his assuming the character of prophet and apostle, and promulgating his new religion.

The Orientals do not agree with us as to the time of the *hijra*. Among the Mahometans, Amari fixes it to the year of Christ 630, and from the death of Moses 2347; and Ben Caffem, to the year of the world 5800: to the Greek computation, among the Christians, Said Ebn Batrick refers the *hijra* to the year of Christ 614, and of the creation 6114.

Klondemir relates, that it was Omar, the second caliph, that first established the *hijra* as an epocha, and appointed the years to be numbered from it: at the time he made this decree, there were already seven years elapsed. This establishment was made in imitation of the Christians, who, in those times, reckoned their years from the persecution of Dioclesian.

But there is another *hijra*, and the earlier too, though of less eminence. Mahomet, in the fourteenth year of his mission, was obliged to relinquish Medina: the Coraschites had all along opposed him very vigorously, as an innovator and disturber of the public peace; and many of his disciples, not enduring to be reputed followers of an impolite, desired leave of him to abandon the city, for fear of being obliged to renounce their religion. This retreat makes the first *hijra*. These two *hijras* the Mahometans, in their language, call *hijras*.

The years of the *hijra* consist only of 354 days. To reduce these years to the Julian calendar, i. e. to find what Julian year a given year of the *hijra* answers to, reduce the year of the *hijra* given into days, by multiplying

by 354, divide the product by 365, and from the quotient subtract the intercalations, i. e. as many days as there are four years in the quotient; and lastly, to the remainder add 622. See *YEAR*.

HEIGHT, the third DIMENSION of a body, considered with regard to its elevation above the ground.

To find the *height* of a hill, see the article of *LEVELLING*, toward the end.

HEIGHT, in *Astronomy*, *Geography*, &c. See *ALTITUDE* and *ELEVATION*.

HEIGHT, in the *Manège*, &c. the stature of a horse, &c.

It is reputed an imperfection in a horse, when set too high on his legs, i. e. when the legs are too long in proportion to the body.

Some jockeys have determined a measure for them thus: take a string, and measure from the horse's withers to his elbow; and what length that is, the same should he have betwixt the elbow and the lower part of the heels. Some measure their colts after this manner at a year old, being of opinion that the legs of a colt at this age are as long as they ever will be.

The duke of Newcastle, and Sir W. Hope, allow this to hold generally, but not universally.

HEIGHTS, in the *Military Art*, are the eminences round a fortified place, whence the armies usually post themselves. The enemy had seized all the *heights*, appeared on the *heights*, &c.

HEINASE, among *Sportsmen*, a 100-buck of the fourth year.

HEIR, HEIRS, in the *Civil Law*, denotes the person who succeeds to the whole estate and effects of another, whether by right of blood or of testament.

The word is formed of the Latin *heres*, of the verb *heredo, to inherit, to remain fast, to stay, follow immediately*, &c.

The institution of an *heir* is a circumstance necessary to the validity of a testament.

There are two principal kinds of *heirs*, the *apparent* and *presumptive*.

HEIR apparent, is he on whom the succession is so settled, that he cannot be set aside without altering the laws of succession; or, whose right of inheritance is indefeasible, provided he outlives the ancestor; as the eldest son or his issue, who must by the course of the common law be *heir* to the father, whenever he happens to die.

HEIR presumptive, is one who, if the ancestor should die immediately, would, in the present circumstances of things, be his *heir*; but whose right of inheritance may be defeated by contingency of some nearer *heir* being born; as a brother or nephew, whose presumptive succession may be destroyed by the birth of a child; or a daughter, whose present hopes may be cut off by the birth of a son. Nay, even if the estate hath descended, by the death of the owner, to such brother or nephew, or daughter; in the former case the estate shall be taken away by the birth of a posthumous child, and in the latter, by the birth of a posthumous son.

HEIR, in *Common Law*, is he who succeeds, by right of blood, to any man's lands, or tenements in fee.

For nothing passes in common law, *jura hereditaria*, by right of inheritance, but fee.

By common law, therefore, a man cannot be *heir* to goods or chattels; for *heres dicitur ab hereditate*, it is the inheritance denominates the *heir*.

Every *heir* having lands by descent, is bound by the sds of his ancestors, if he be named; it being a maxim, that *qui facit unumquemque, facit debitor eius*. But, though ever so much land come to him from such ancestors by gift in tail, or conveyance of the father, and not by descent, he is no way chargeable; and the case is the same in all other estates, except fee-simple.

Estates are transmitted from the ancestor to the *heir*, according to certain rules or canons of inheritance, for which see *DESCENT* *colateral*.

Those that are incapable of being *heirs* are *BASTARDS*, *ALIENS*, and persons attainted for treason or felony, (see *ATTAINER*); but idiots and lunatics, persons excommunicated, or that are attainted in a *praemunire*, outlaws in debt, &c. are capable of being *heirs*.

The *heir* is favoured by common law; for not only land, but rent not due and in arrear at the death of the ancestor, shall go to the *heir*; so corn sown by a tenant for years, where his term expires before his corn is ripe, and every thing fastened to the freehold, timber-trees, deeds belonging to the inheritance, deer, conies, pigeons, fish, &c. go to the *heir*. If an *heir* hath more land fallen to him by descent, execution had been against him to the value of the land, &c. if it be not sold *bona fide* before the action brought, in which case there is a saving by the stat. 3 and 4 Will. and Mary, cap. 14, and it shall be

HELICE, *Ensis*, in *Astronomy*, the same with *URSA major*.
HELICOID *parabola*, or the *parabola spiralis*, a curve arising upon a supposition of the axis of the common Apollonian PARABOLA's being bent round into the periphery of a circle.

The *helical parabola*, then, is a line passing through the extremities of the ordinates, which converge towards the centre of the said circle.

Suppose, e. g. the axis of the common parabola to be bent into the periphery of the circle BDM, (see *Tab. Canticæ*, fig. 11.) then the curve BFGNA, which passes through the extremities of the ordinates CP and DG, which converge towards the centre of the circle A, constitutes what we call the *helicoid*, or *helical parabola*.

If the arch BC, as an abscissa, be called x , and the part CF of the radius, as an ordinate to it, be called y , and the parameter of the parabola be called l , the nature of this curve will be expressed by the equation $l = x^2 y$. See EQUATION.

HELICON, in *Antient Geography*, the name of a mountain in the neighbourhood of Paros and Cytheron, sacred to Apollo and the Muses, who are thence called *Heliconides*. This fountain *Eliferece* flowed at the foot of this mountain, and here was also shown the sepulchre of Orpheus. It is situated in Livadia, and now called Zagora or Zagura.

HELICTERIS, in *Botany*, the *Screw-tree*, a genus of the *gynandria didynamia* class. Its characters are these: the flower has a gorgeous empalement of one leaf; it hath five oblong equal petals, which are fixed to the empalement, and ten short filamina at the base of the germen, with five medianis surrounding the germen, which have the appearance of petals: the style supports the germen at the top, which afterward turns to a twisted spiral fruit with one cell, enclosing many kidney-shaped seeds. There are three species, natives of the West Indies. Miller.

HELIOCARPUS, in *Botany*, a genus of the *didynamia digyna* class. Its characters are these: the flower hath one petal, which is cut into five segments, and hath an empalement of one leaf, which is cut into five parts; in the centre is situated a roundish germen, attended by several filamina, which becomes an oval compressed capsule, about three lines long and two lines broad, with a transverse partition dividing it into two cells, each containing a single roundish seed ending in a point; the borders of the capsule are set with hairs resembling rays. We know but one species of this plant, which was discovered by Dr. Houlton growing at Old La Vera Cruz, in New Spain. Miller.

HELIOCENTRIC *place of a planet*, is the place wherein the planet would appear, to be if viewed from the centre of the sun, or the point of the ecliptic, whence a planet viewed from the sun would appear to be.
 The word is compounded of *heli*, sun, and *centric*, centre. The *heliocentric* place, therefore, coincides with the longitude of a planet viewed from the sun. See PLACE.

HELIOCENTRIC *latitude of a planet*, is the inclination of the line drawn between the centre of the sun and the centre of a planet to the plane of the ecliptic.

The *heliocentric* latitude of a planet is thus determined: if the circle KDM (see *Tab. Astron.* fig. 62.) represent the orbit of the earth round the sun, and the inner one ANBN, be placed so as to be inclined to the plane of the other (for which reason it appears in the form of an ellipse), when the planet is in N or n (which points are called its *nodes*), it will appear in the ecliptic, and to have no latitude; if it move to P, then, being seen from the sun, it will appear to decline from the ecliptic, or to have a latitude; and the inclination of the line RP to the plane of the ecliptic, is called the planet's *heliocentric* latitude; and the measure of it is the angle PRQ, supposing the line PQ to be perpendicular to the plane of the ecliptic.

This *heliocentric* latitude will be continually increasing, till it come to the point A, which they call the limit or utmost extent of it; and then it will decrease again, till it come to nothing in N; after which it will increase again, till it come to B; and lastly, it will be decreasing again, till the planet comes to be in n, &c.

HELIOCENTROS, in *Natural History*, a name given to an insect of the poisonous kind, called by Aristotle PHALANGIUM *delictum*, and by the Latins SOLIPUGA.

HELIOCOMETES, *comet of the sun*, a phenomenon sometimes observed at the setting of the sun; this denominated by Strabonius and Ptolemy, who had seen it, because it seems to make a comet of the sun, being a large tail, or column of light, fixed or hung to that luminary, and straggling after it at its setting, much in the manner of a tail of a comet.

It was observed by M. Pyle, at Grypswald, March 15, 1752, at five o'clock in the afternoon, the end which

Vol. II. N° 168.

touched the sun was only half the sun's diameter broad, but the other end, opposite to the sun, was much broader; its length was above ten diameters of the sun, and it moved in the same track as the sun; its colour was yellow, near the sun, and darker farther off; it was only seen pointed on the thinner higher clouds; a little telescope easily discovered, that there was nothing of it on the thicker and lower clouds, though the naked eye could not discover so much. It lasted in its full vigour the space of an hour, and then gradually diminished.

HELIONETER, *formica of soap, sun, and silver, I measure*, the name of an instrument called also *effrontery*, invented by M. Bouguer in 1747, for measuring with particular exactness the diameters of the flat, and especially those of the sun and moon.

This instrument is a kind of telescope, consisting of two object glasses of equal focal distance, placed one of them by the side of the other, so that the same eye-glass serves for both. The tube of this instrument is of a conic form, larger at the upper end, which receives the two object-glasses, than at the lower, which is furnished with an eye-glass and micrometer. By the construction of this instrument two distinct images of an object are formed in the focus of the eye-glass, whose distance, depending on that of the two object-glasses from one another, may be measured with great accuracy: nor is it necessary that the whole disc of the sun or moon come within the field of view; since, if the images of only a small part of the disc be formed by each object-glass, the whole diameter may be easily computed, by their position with respect to one another: for, if the object be large, the images will approach, or perhaps lie even over one another; and the object-glasses being movable, the two images may always be brought exactly to touch one another, and the diameter may be computed from the known distance of the centres of the two glasses: besides, as this instrument has a common micrometer in the focus of the eye-glasses, when the two images of the sun or moon are made in part to cover one another, that part which is common to both the images may be measured with great exactness, as being viewed upon a ground that is only one half less luminous than itself; whereas, in general, the heavenly bodies are viewed upon a dark ground, and, on that account, are imagined to be larger than they really are. By a small addition to this instrument, provided it be of a moderate length, M. Bouguer thought it very possible to measure angles of three or four degrees, which is of particular consequence in taking the distance of stars from the moon. With this instrument M. Bouguer, by repeated observation, found, that the sun's vertical diameter, though somewhat diminished by the astronomical refraction, is longer than the horizontal diameter; and, in ascertaining this phenomenon, he also found, that the upper and lower edges of the sun's disc are not so equally defined as the other parts; on this account his image appears somewhat extended in the vertical direction. This is owing to the decomposition of light, which is known to consist of rays differently refrangible in its passage through our atmosphere. Thus, the blue and violet rays, which proceed from the upper part of the disc at the same time with those of other colours, are somewhat more refracted than the others, and, therefore, seem to us to have proceeded from a higher point; whereas, on the contrary, the red rays proceeding from the lower edge of the disc, being less refracted than the others, seem to proceed from a lower point: so that the vertical diameter is extended or appears longer than the horizontal diameter. Mem. Acad. Sc. Par. 1748.

Mr. Servington Savery discovered a similar method of improving the micrometer, which was communicated to the Royal Society in 1743. See MICROMETER.

HELIOPHILA, in *Botany*, a genus of the *tetradynamia filiquia* class. The corolla consists of two medianis, that are recurved towards the vascular base of the calyx.

HELIOSCOPE, in *Optics*, a sort of telescope, peculiarly fitted for viewing and observing the sun, without doing prejudice to the eye.

The word is compounded of *heli*, the sun, and *scopus*, vision, sight, I see, view, consider. Helioscopes are necessary in viewing the phenomena of the sun, as his spots, eclipses, &c.

There are various apparatuses of this kind. As coloured glasses are found to diminish the force of the sun's rays, to make a helioscope, it is enough that both the object-glass and the eye-glass of the telescope be of coloured glass; the first, e. g. of red, and the latter green.

But as there is a necessity for the glasses to be very transparent and equally coloured, which rarely happens, Helioscopes rather to use two plain-coloured glasses, with a piece of paper between, either tied or cemented together, and applied before the eye-glass.

Dr. Hooke, in an *excellent* treatise on *helioscopes*, recommends four reflecting glasses placed in the tube: by these, he observes, the force of the rays will be so weakened, as only to strike the eye with a 25th part of their force; and this *helioscope* he prefers to all others.

M. Huygens's method is much easier: he only blackens the inside of the eye-glass of the telescope, by holding it over the flame or smoke of a lamp or candle; or, which is yet more commodious, blackens a piece of plain glass, and holds it between the eye and the object-glass; or, which is the best of all, joins the smoked glass to another, with a rim of thick paper between, to keep the black from rubbing off, and fits the two into a cell or frame, to be applied between the eye and the eye-glass.

HELIOSTATA, from *heli*, sun, and *stata*, I fix, in *Optics*, the name of an instrument invented by Dr. Gravesande, and thus called from its property of fixing the sun-beam in due position, viz. in a horizontal direction across the dark chamber whilst it is used.

This is an automaton, or piece of clock-work, consisting of the following parts: A A (Tab. II. *Opticæ*, fig. 29) is a frame in which a metalline speculum S is suspended, moveable about its axis by means of two small screws at *a*. This frame is fixed to the piece Q, which being hollow, is moveable upon the cylindric flut. P about the iron pin *e*. (See the part by itself.) This pillar R is fixed to a triangular base or foot set perpendicularly by the three screws B, B, B.

On the back part of the speculum is fixed a long cylindric wire or tail DE, in a perpendicular position. By this it is connected to the second part of the *heliostata*, which is a common twenty-four hour clock, represented at H; the plane of which clock is parallel to that of the equator in any given place. This clock is fastened on the column FG, in which it is moveable up and down by a thin lamina or plate that enters it as a case, and fixed to a proper height by the screws *d*, *d*, at the side. The whole is truly adjusted to a perpendicular situation by means of the three screws I, I, I, in the tripod LLM, and the plummet Q, whose culpis must answer to the points beneath.

The axis of the wheel, which moves the index NO over the hour-circle is somewhat large, and perforated with a cylindric cavity verging a little to a conical figure; and receives the thick *q* of the said index NO very close and tight; that by its motion the index may be carried round. In the extremity O of the index is a small cylindric piece *n*, with a cylindric perforation to receive the tail of the fork T, yet so as to admit a free motion therein. In each side of the fork are several holes exactly opposite to each other, in which go the screws *r*, *r*, upon whose smooth cylindric ends moves the tubular piece R on its axis *u*, *u*.

When the machine is to be fixed for use, another part is made use of to adjust it; which is called the *pillar*, and is denoted by the letters VXYZ. The cylindric C is removed with the speculum from the foot P, and the brass column V X put on in its stead, and adheres more strictly to the pin *a*, that it may keep its position while the machine is constituted.

On the top of the column, about X as a centre, moves the lever YZ, so that it may be any-how inclined to the horizon, and keep its position. The arm YX may be of any length at pleasure, but the arm YZ is of a peculiar construction, and of a determinate length. To this arm, which extends no farther than Y, is adapted a sliding-piece Z *w* sharp-pointed at Z. By this the arm XZ is determined to a given length, the piece Z *w* being fixed by the screws *z*.

Upon this arm, is drawn the short line *u*, *u*, by which it may be lengthened in the whole, and is $\frac{1}{10}$ of the whole length XZ when shortest. The reason is, this arm is always to increase and decrease in proportion to the secant of the sun's declination to the radius XZ when shortest; but the radius is to the secant of $23^{\circ} 30'$ (the sun's greatest declination) as 1000000 to 1090411, or as 100 to 109.

New the reason of this construction of the arm XZ is to find for any given day the distance of the centre of the speculum S from the top I of the style IN, which must ever be equal to the secant of the sun's declination; for it must always be equal to the distance of the top of the said style I from the centre of the cylinder R in the fork T, and that is ever equal to the said secant of declination.

For since the style IN and the fork T are in a position parallel to each other, therefore the middle hole in the sides of the fork being (as they must be) of the same height above the end of the index O as is the height of the style IN, it is evident that on an equinoctial day the sun's rays will pass directly through the perforation of the piece R, if it be put in a position parallel to the plane

of the ecliptic, or that of the clock; and also that the top of the shadow of the same style will fall exactly on the said hole.

In this case the top of the style is at the least distance from the central point of R, and therefore may be represented by radius, while in any other position above or below, the distance will increase in proportion to the secant of the angle which the rays make with this first or middle ray, that pass by the top of the style, and through the hole R.

Now it may be demonstrated, that on any day of the year, if the clock and its pedestal be so fixed, that the line of XII be exactly in the meridian, and that the position of R in the fork be such that the sun's rays go directly through it, and the shadow of the style's top fall just upon the hole; moreover, if the distance of the centre of the speculum S from the top of the style I be made equal (by the position) to the distance of the central point R therefrom; and lastly, the tail of the speculum DE passing through R; if then the clock be put into motion, the index NO shall carry about the tail of the speculum in such a manner, that at all times of that day when the sun can come upon the speculum it will reflect the rays constantly in one and the same position and direction all the time without variation.

The machine thus constituted is placed in a box or case, and set in a window with one side open, exposed to the sun, and all the other parts close; so that when the room is made dark, and the solar microscope fixed to the fore-part of the box in which the *heliostata* is placed, just against the centre of the speculum to receive the reflected horizontal beam, all the experiments of the darkened room are then performed as usual. This is a very ingenious construction of a solar microscope apparatus, and full of art, but it is to be feared, too expensive and troublesome for common use. However, it is easy to see that this machine is capable of being greatly reduced; for it may be made to answer the end very well without a clock; also the speculum may be glass instead of metal, and all fixed on one foot or pedestal.

For a farther account of this instrument, the principles of its construction, and its use, see Gravesande's *Physico-Mathematicæ*, &c. tom. ii. p. 715, &c. ed. 3ta. 1742.

HELIOSTROPHUS, in the *Metamorphosis*, a name given by some of the Greek writers of the later ages to the gum ammoniacum of the ancients, which seems to have been a very different thing from what is called gum ammoniacum at this time; it being yellow and friable, our's whitish and tough.

HELIOTROPE, *heliotropium*, among the *Antients*, an instrument or machine for shewing when the sun arrived at the tropics and the equinoctial line. This name was also used for a sundial in general.

HELIOTROPE is also a precious stone, of a green colour, streaked with red veins.

Pliny says, it is thus called, because, when cast into a vessel of water, the sun's rays, falling thereon, seem to be of a blood colour; and that, when out of the water, it gives a faint reflection of the figure of the sun, and is proper to observe eclipses of the sun, as a helioscope.

The *heliotrope* is also called *oriental jasper*, on account of its rusty spots.

It is found in the East Indies; as also in Ethiopia, Germany, Bohemia, &c. Some have ascribed to it the faculty of rendering people invisible, like Gyges's ring. See **HAMATITES**.

HELIOTROPE, *heliotropium*, from *heli*, sun, and *trope*, I turn, in *Bary*. See **TURNIOLE**.

HELISPHERICAL line, in *Navigation*, denotes the RHUM line.

It is thus called, because, on the globe, it winds round the pole helically, i. e. spirally, and still comes nearer and nearer to it.

HELIX, in *Geometry*, a spiral line. See **SPIRAL**.

The word is Greek, *hélē*, and literally signifies a wreath or winding; of *corona*, *incoronatus*, *perizonia*.

In *Architecture*, some authors make a difference between the *helix* and the *spiral*.

A *helic*, according to Davila, is in a *helix*, or is *helical*, when the stairs or steps wind round a cylindric vessel; whereas the *spiral* winds round a cone, and is continually approaching nearer and nearer its axis.

HELIX is also applied, in *Architecture*, to the volutes, or little volutes, under the flowers of the Corinthian capital; called also *volutes*. See *Tab. Archit.* fig. 27. See also **CAULICOLES**.

HELIX, in *Astronomy*, is the whole circuit of extent of the auricle, or border of the ear outwards.

In opposition to which, the inner protuberance surrounded thereby, and answering thereto, is called *antihelix*.

HEL

Helix jambulii and *violacea*, a kind of shell-fish or testaceous animal, first found floating on the surface. It is a small, firm, fleshy, and supported on the surface of the foot by a small cluster of bubbles, which are filled with air, and a tenuous, slimy substance, that will easily part with its contents. This animal is oviparous, and these bubbles serve only as a medium for its eggs. It is probable it never goes down to the bottom, nor willingly approaches any shore, for the shell is exceedingly brittle, few fresh-water snails having flesh so thin. Every shell contains about a tea-spoonful of liquor, which it easily discharges on being touched, and which is of the most beautiful purple that can be conceived. It is greenish colour, and it may be worth enquiry, as the shell is certainly found in the Mediterranean, whether it be not the *maraca* of the ancients. The *larva crassidula* probably feeds upon it, as in June it is of the same colour with that of the beautiful liquor contained in its shell.

HELL, a place of punishment, wherein the wicked are to receive the rewards of their evil deeds after this life. In this sense hell stands opposed to HEAVEN.

Among the ancients hell was called *Tartarus*, *Tafarsis*, *Tartar*, *Tartara*, *'Adn*, *Hades*, *Infernal*, *Inferna*, *Infer*. &c.

The Jews, wanting a proper name for it, called it *Gebenna*, or *Gehennam*, from a valley near Jerusalem, wherein was a Tophet, or place where a fire was perpetually kept.

Divines reduce the torments of *hell* to two kinds; *pæna damni*, the loss and privation of the beatific vision; and *pæna sensus*, the horrors of darkness, with the continual pains of fire inextinguishable.

bold nations and religions have their notions of a hell.
The end of the poets is terrible enough: witness the
 punishment of Tityus, Prometheus, the Danaids, La-
 ois, Phlegyas, &c. described by Ovid in his *Metamor-*
phosis. Virgil, after a survey of hell, *Maecius*, his si-
 dears, that if he had a hundred millions of stu-
 gers, they would not suffice to recount all the plagues of the
 tortured. The New Testament represents hell as a *lake*
of fire and brimstone, and a worm which dieth not, &c.
 Rev. x. 10, 14. &c. Mark ix. 48. Luke xvi. 23. &c.
 The Caffres are said to admit thirteen *hells*, and twenty-
 seven parallels; where every person finds a place of re-
 compence suited to the degree of good or evil he has
 done.

There are two great points of controversy among writers concerning *bell*, the bell, whether there really be any local *bell*, any proper and specific place of torment by fire? or, second, whether the torments of *bell* are to be eternal? I. The locality of *bell*, and the reality of the fire thereof, have been controverted from the time of Origen. That father, in his treatise *Apoc. Agg.*, interpreting the scripture account metathetically, makes *bell* to consist not in external punishments, but in the confidence of sinners, the feare of their guilt, and the remembrance of their sin, as places of torment. This opinion is one of the same opinion in his time; and Calvin, and many of his followers, have embraced it in ours.

The retainers to the contrary opinion, who are much the greatest part of mankind, are divided as to the situation and other circumstances of this horrible scene. The Greeks after Homer, Hesiod, &c. conceived *hell*, τὸν τῶν δαιμόνων καὶ τῶν ψυχῶν, &c. as *large and dark place under the earth*. Lucian, De Luctu; and Eustathius, on Homer.

Some of the Romans lodged it in the subterranean regions directly under the lake Avernus, in Campania; in which they were led to from the consideration of the poisonous vapours emitted by that lake. Through a dark cave near this lake Virgil makes Aeneas descend to hell. See AENEAS.

Others placed *hell* under Tenarus, a promontory of Laconia; as being a dark frightful place, beset with thick woods, out of which there was no finding a passage. This way, Ovid says, Orpheus descended to *hell*. Others fancied the river or fountain of Styx, in Arcadia, the spring-head of *hell*, because the waters thereof were deadly.

But they are all to be considered as only fables of poets, who, according to the genius of their art, allegorizing and personifying every thing, from the certain dead men with in those places took occasion to represent them as in many gates or entering places into the other world. The primitive *Chiristians*, conceiving the earth a large extended plain, and the heavens an arch drawn over the same, took *hell* to be a place of the earth, the farthest distant from the heavens; so that their *hell* was our antipodes.

Tertullian, *De Anima*, represents the Christians of his time as believing *hell* to be an abyss in the centre of the earth; which opinion was chiefly founded on the belief

HEL

of Christ's descent into *Hades*, *hell*, *Mat.* xii. 40. See the following article *HELL*.

Mr. Whilton has advanced a new opinion. According to him, the comets are to be conceived as so many *hells*, appointed in the course of their trajectories or orbits, alternately to carry the damned into the confines of the fun, there to be torched by his flames; and then to return them to freeze in the cold, dreary, dark regions, beyond the orbit of Saturn.

Mr. T. Swinden, in an express enquiry into the Nature and Place of *Hell*, not contented with any of the places hitherto assigned, contends for a new one. According to him the true *hell* is the *hell* *hell*. This does not seem to be his own discovery: it is probable he was led into the opinion by that passage in Rev. xvi. 8, 9. "I thought it must be added, that Pythagoras seems to have had the like view, because he places *hell* in the sphere of fire, and that sphere in the middle of the universe. Add, that Aristotle mentions some of the Pythagoric fables, and places the sphere of fire in the sun, and even calls it Jupiter's Prison. De Caelo, lib. ii.

His arguments for the fun's being *the best of all* are, 1. Its capacity. Nobody can enjoy the fun (space) until he has got all the damned consequences of it. There will be no want of room. Nor will Sir be wanting, if we admit of Mr. Swinden's argument against Aristotle, whereby he demonstrates that the fun is hot, p. 208, & seq. The good man is "filled with amazement to think what Pyrenean mountains of sulphur, how many Aetnaic oceans of scalding bitumen, must go to maintain such mighty flames as those of the fun;" to which our *Zeus* and *Vesuvius* are more glorious worms." P. 137.

3. Its distance and opposition to the empyreum, which has usually been looked upon as the local heaven: such opposition is perfectly unwearyable so that opposition in the nature and office of a place of angels and devils, of elect and reprobate, of glory and horror, of hallelujahs and curfings; and the distance quadrates well with Dives seeing Abraham *exor off*, and the great gulf *between them*, which this author takes to be the polar vortex.

3. That the empyreum is the highest and the sun the lowest place of the creation, considering it as the centre of our system; and that the sun was the first part of the visible world created, which agrees with the notion of its being primarily intended or prepared to receive the angels, whose fall he supposes to have immediately preceded the creation.

4. The early and almost universal idolatry paid to the sun ; which foits well with the great subtilty of that spirit to entice mankind to worship his throne.

11. As to the eternity of *hell*-torments, we have Origen, again, at the head of those who deny it; it being the doctrine of that writer, that not only men, but devils themselves, after a suitable course of punishment, answerable to their respective crimes, shall be pardoned and referred to heaven. *Aug. De Civit. Dei*, lib. xxi. cap. 17. The chief principle Origen went upon was this, that all punishments are emendatory, applied only as painful medicines, for the recovery of the patients' health. And other objections insisted on by modern authors are the disproportion between temporary crimes and eternal punishments. &c.

The scripture parables for eternity, as is observed by archbishop Tillotson, do not always import an infinite duration: thus, in the Old Testament, for *our* cities signify only a long time, particularly to the end of the Jewish dispensation: thus, in the Epistle of Jude, ver. 7, the cities of Sodom and Gomorrah are said to be set forth for an example, suffering the vengeance of *eternal* fire; that is, of a fire that was not extinguished till those cities were utterly consumed. So one generation is said to come, &c. but the earth endureth *for ever*.

In effect, M. Le Clerc notes, that there is no Hebrew word which properly expresses eternity: **הוּלָם**, *hulam*, only imports a time whose beginning or end is not known; and is accordingly used in a more or less extensive sense according to the thing treated of.

Archbishop Tillotson, however, argues very strenuously, that where *hell-sentence* is spoken of, the words are to be understood in the strict sense of infinite duration; and what he effects a peremptory decision of the point is, that the duration of the punishment of the wicked is in the very same sentence expressed by the very same word which is used for the duration of the happiness of the righteous, which all agree to be eternal. "There," speaking of the wicked, shall go away, *in eternum*," *amoveo, into eternal punishment*; but the righteous, *in eternum vivunt, live life eternal*."

The same great author attempts to reconcile this eternity with the divine justice, which had not been satisfactorily done.

done before. Some had arg'd, that all sin is infinite, in respect of the object it is committed against, viz. God; and therefore deserves infinite punishment: but, that crime should be heightened by the quality of the object to such a degree, is absurd; since the evil and demerit of all sin must be equal, inasmuch as none can be more than infinite; and consequently there can be no foundation for degrees of punishment in the next life. Add, that for the same reason as the least sin against God is infinite, in respect of its object, the least punishment inflicted by God may be said to be infinite, because of its author; and thus all punishments from, as well as sin against God, would be equal.

Others have urg'd, that if the wicked were to live for ever they would sin for ever: but this, says the author, is mere presumption. Who can say, that if a man lived ever to long, he would never repent? besides, the justice of God only punishes *sin* which men have committed, not those they might possibly have committed.

Others therefore urg'd, that God gives men the choice of everlasting happiness and misery; and that the reward promised to obedience is equal to the punishment threatened to disobedience. To which it was answered, that though it be not contrary to justice to exceed in rewards, that being matter of mere favour, it may be so to exceed in punishments.

It may be added, that a man in this case has nothing to complain of, since he has only his election. But though this may suffice to silence the sinner, and make him acknowledge his destruction to be of himself, it does not satisfy the objection from the disproportion between the crime and the punishment. All the considerations, therefore, hitherto alleged, proving ineffectual, our great author is left to solve the difficulty himself.

In order to this he observes, that the measure of penalties with respect to crimes, is not only, nor always, taken from the quality and degree of the offence, much less from the duration and continuance of it; but from the reasons of government, which properly require such penalties as may secure the observation of the law, and deter men from the breach of it. Among men it is not reckoned injudicious to punish murder, and many other crimes, which perhaps are committed in a moment, with perpetual loss of estate, or liberty, or life: so that the objection of temporary crimes being punished with such long sufferings is of no force.

In effect, what proportion crimes and penalties are to bear to each other, is not so properly a consideration of justice as of wisdom and prudence in the lawgiver, who may enforce his laws with what penalties he pleases, without any impeachment of his justice, which is out of the question.

The primary end of all threatening is not punishment, but the prevention of it: God does not threaten, that men may sin, and be punished; but that they may not sin, and so escape; and therefore the higher the threatening runs, the more goodness there is in it.

After all, it is to be considered, says the good archbishop, that he who threatens has still the power of execution in his own hands. There is this difference between promises and threatenings; that he who promises, passes over a right to another, and thereby stands obliged to him, in justice and faithfulness, to make good his word; but it is otherwise in threatenings; he that threatens, keeps the right of punishing still with him, and is not obliged to execute what he has threatened, any farther than the reasons and ends of government require. Thus, God absolutely threatened the destruction of Nineveh, and his pious prophet understood the threatening to be absolute, and was angry for being employed in a message that was not made good; but God understood his own right, and did what he pleased, notwithstanding the threatening he had denounced, and notwithstanding Jonah was touched in point of honour, that he had rather have perished than Nineveh should have escaped. Tillotson's Sermons, vol. i. p. 411. ed. fol. 1710.

HELL, *hades*, is sometimes also used, in the scripture style, for death and perdition; because the Hebrew and Greek names signify sometimes the place of the damned, and sometimes simply the grave. See *ADAM*.

The word *hell* is of Saxon extraction, and signifies a *causal pain*; and thence, by an easy transition, the place of the dead, or the invisible state into which death removes mankind. From the same original we still retain in our language the word *hell*, or *hell*, which signifies to *over-see*; and in this sense lord King maintains that the word *hell* is used and ought to be understood in the Apostle's Creed: the meaning of the article relating to our Saviour's descent into *hell* being no other than this, that his soul, being separated from his body by a real transition and local motion, went into the unseen region of spirits, where, according to the laws of death it re-

mained among other pious departed souls till the resurrection of his body. Others contend, that he descended into the place of torments, where he triumphed over the devils, &c. Cui. Hist. of the Apostles Creed, p. 181, &c. Pearson on the Creed, p. 219. The Romanists add, that he there comforted the souls in purgatory, and brought away the spirits of the patriarchs, and other just persons, departed till that time, carrying them with him into paradise.

In the Romish church, that part of *hell*, wherein those were retained who died in the mercy and favour of God before our Saviour's sufferings, is called *LIMBUS*.

HELLEBORE, *RAKIBOROL*, or *ELEROROL*, a medicinal plant, reputed among the ancients, a specific for the cure of melancholy and madness.

There are two kinds of *hellebore*, the *black* and the *white*.

The characters of the *black hellebore*, also called the Christmas-flower, which is a genus of the *polyandria polygama* class, are these: the flower has no empalement, but has five large, roundish permanent petals, and many small nectaries placed circularly; it has a great number of stamina, and several compressed germina, which afterward turn to compressed capsules with two keels, the lower short, and the upper convex, filled with round seeds adhering to the seam. Miller enumerates six species, Linnaeus five.

The *white hellebore*, *veratrum*, which is a genus of the *polyandria masculina* class, has these characters: it has hermaphrodite and male flowers intermixed in the same spike; the flowers have no empalement, but have six oblong spear-shaped petals which are permanent, and six awl-shaped stamina fitting on the point of the germin, spreading slender, and terminated by quadrangular summits; they have three oblong erect germina fitting upon the style, which are scarcely visible, crowned by a single spreading stigma; the germina afterward become three oblong, erect, compressed capsules, with one cell opening on the inside, including many oblong, compressed, membranaceous seeds: the male flowers have the same characters with the hermaphrodite, but are barren. There are four species according to Miller, and three in the Linnaean system.

It is only the roots that are used in each kind, which are to be chosen large and fair, furnished with thick filaments: those of the *white*, tan-colour without, and white within; and those of the *black*, blackish without, and brownish within; dry, clean, and of a sharp, disagreeable taste.

The ancients, as already observed, had a great opinion of their efficacy in diseases of the mind: whence various phrases and forms of speaking among writers; as *egrot helleborum dignum*: Juvenal says, Nisi necesse est double dose of *hellebore*; *dosis de elchibi multo pars maxima eris*. The island of Anteyra, situate against mount Cera, was famous for the growth and use of this plant; it being here in its greatest perfection, and used with the best effect: whence the proverb *Navigat Anteyra, sed him a torpore in Anteyra*, spoken of a madman.

The *white*, which is common in mountainous places, in Germany, Switzerland, and other parts of Europe acts in doses of ten or fifteen grains, as a purgative, but is very violently both upwards and downwards, as frequently to cause convulsions; whence the use of it internally is now discontinued: but it is still retained with success for the *farcy* in horses and the *scab* in sheep, and for some kinds of maniacal cases, as a last resource.

The chief use wherein the present practice acknowledges it, is in form of a trepanatory powder, to clear and open the head, in lethargic and other disorders: the powder has likewise been used, with other external applications, for destroying cutaneous insects. Infusions of the root in water, and the extracts obtained by inspissating them, operate with less violence.

There is a preparation in the shops, which is used sometimes in glysters, called *mal helleborum*, which is obtained by macerating a pound of the root for three days in four pints of water, and boiling it a little; the decoction, strained, is mixed with three pounds of clarified honey, and the mixture boiled down till the water has exhaled. There is also a tincture, drawn with a quart of proof spirit from eight ounces of the root, which is sometimes given in doses of a few drops as an alterative, and once or two drams and upwards as a cathartic and emetic.

The *black hellebore*, also called *malampicium*, and used among us, Dr. Quincy suggests to be much inferior in virtue to that of the ancients; because it will not operate much by stool, but is only a powerful alterative, getting far into the habit, and to promoting sweat; however, in doses of ten grains to half a dram, it will prove a strong

a strong, though not very violent cathartic: the root and its preparations are chiefly used, in small doses, as attenuants and deobstruents.

He adds, that he has known it do wonders in the gout and rheumatism, and that it rarely fails in obstructions of the menses. It is also serviceable in plethoric and sanguine constitutions, where chalybeate are ineffectual or injurious.

The extract made with water, given in doses from eight or ten grains to a scruple or more, is the best and safest preparation of this root, when designed for a cathartic; and a tincture made in proof spirits appears to be the most eligible preparation for the purpose of an alterative and deobstruent: four ounces of the root may be digested in a quart of the spirit, with the addition of thirty or forty grains of cochineal; and the filtered tincture may be given in the quantity of a tea-spoonful twice a day, in warm water or any other convenient vehicle. *Lewo, Mar. Med.*

HELLEBORE, *Helleborus*, or *Helleborine*, *scutellaria*, in Botany, a genus of the *gynandria diandria* class. Its characters are these: it has a single leaf, and the sheath of the flower is at a distance; the germen sustains the flower, which has no enlargement, but has five oblong oval petals; the nectarium is the length of the petal, hollowed at the base, oval and gibbous below, cut into three points; the flower has two short stamens, sitting upon the point, terminated by erect filaments, placed under the upper lip of the nectarium, and an oblong contorted germen, situated under the flower, the style growing to the upper lip of the nectarium, crowned by an obsolete stigma; the germen becomes an oval, obtuse, three-cornered capsule, armed with three keels, opening with a valve under each, having one cell, filled with small seeds. There are four species. *Miller. Linnaeus recusus fix.*

HELLEBORE with a *globosa floure*, or *glob. runcuncul.*, *trifolius*, in Botany, a genus of the *polyandria polygama* class. Its characters are: the flower has no enlargement; it has about fourteen almost oval petals, whose points meet together; it has nine narrow, plain, incurved, umbellicated nectaries, which are perforated at their base; and a great number of bristly filaments, terminated by erect filaments, with numerous germina forming a capsule, without styles, which afterward become as many capsules, collected into an oval head, each containing one seed. There are two species. *Miller.*

HELLENISM, a sort of Grecism; or a phrase peculiarly accommodated to the genius and construction of the Greek tongue.

Hellenism is distinguished from *Grecism*, in that the former is not applied to authors who have written in Greek; their language, it is evident, should be a continual *Hellenism*; but it is applied to authors, who, writing in some other language, use terms and expressions peculiar to the Greek.

There are abundance of *Hellenisms* in the Vulgate version of the scriptures.

HELLENISTIC, or **HELLENISTIC language**, that used among the *HELLENISTS*.

The critics are divided as to this language. Several of them, and among the rest *Drassus* and *Scaliger*, take it to be the language used among the Grecian Jews. They add, that it is in this language the Greek translation of the Septuagint was written, and even the books of the New Testament composed. *M. Simon* calls it the language of the *Ismaelites*.

It must not be imagined, that this was any peculiar language distinct from all others, or even any peculiar dialect of the Greek; it was only denominated, to show that it was Greek, mixed with *Hebraisms* and *Syncretisms*. *Salmasius* respects the common opinion of the learned touching the *Hellesinist* language, and has written two volumes on the subject, in which there is not a little *logomachy*.

HELLENISTS, *HELLENISTAE*, a term occurring in the Greek text of the New Testament, and which in the English version is rendered *Grecians*.

The critics are divided as to the signification of the word. *Guicciardini*, in his *Scholia* on *Act. vi.* 1. observes, that it is not to be understood as signifying those of the religion of the Greeks, but those who spoke Greek, the *Hebraei phrygians*. The authors of the Vulgate version, indeed, render it, like ours, *Grecians*; but *Mellius* Du Port Royal, more accurately, *Trist. Greci, Greek or Graecian Jews*; it being the Jews who spoke Greek that are here treated of, and who are hereby distinguished from the Jews called *Hebraei*, that is, who spoke the Hebrew tongue of that time.

The *Hellesinistae*, or Grecian Jews, were those who lived in Egypt, and other parts, where the Greek tongue prevailed. It is to them we owe the Greek version of the Old Testament, commonly called the *SEPTUAGINT*, or that of the Seventy.

VOL. II. N° 169.

Salmasius and *Vossius* are of a different sentiment with regard to the *Hellesinistae*. The latter will only have them to be those who adhered to the Grecian intercity.

Scaliger is represented, in the *Scaligeriana*, as asserting the *Hellesinistae* to be the Jews who lived in Greece and other places, and who read the Greek Bible in their synagogue, and used the Greek language in society; and thus they were uprooted to the Hebrew Jews, who performed their public worship in the Hebrew tongue; and in this sense *St. Paul* speaks of himself as a Hebrew of the Hebrews, *Phil. iii. 5.* i. e. a Hebrew both by nation and language. The *Hellesinistae* are thus properly distinguished from the *Hebraei* or Greeks, mentioned *John xii. 20.* who were Greeks by birth and nation, and yet professed to be Jewish religion.

HELLENODICA, *Ἑλληνικά*, in Antiquity, the directors of the Olympian games. At first there was only one, afterwards the number increased to two and to three, and at length to nine. They assembled in a place called *Ἑλληνισμός*, in the Eleian forum, where they were obliged to reside ten months before the celebration of the games, to take care that such as offered themselves to contend, performed their *ὑπομνηματα*, or preparatory exercises, and to be instructed in all the laws of games by certain men called *νομοφύλακες*, i. e. keepers of the laws. And the better to prevent all unjust practices they were farther obliged to take an oath, that they would act impartially, would take no bribes, nor discover the reason for which they disliked or approved of any of the contenders. At the solemnity they sat naked, having before them the viclorial crown till the exercises were finished, and then it was presented to whomsoever they adjudged it. Nevertheless, there lay an appeal from the *hellenodica* to the Olympian senate. *Post. Archæol. Græc. lib. ii. cap. 23. tom. i. p. 448.*

HELLENODICÆUM, *Ἑλληνιστικόν*, in Antiquity, the place where the *HELLENODICA* were used to assemble.

HELLENOTAMIA, *Ἑλληνισμῶν*, in Antiquity, Athenian officers appointed to receive the money due from the tributary cities.

They were also called *hellenotamiae*.

HELLOTIA, *Ἑλλώτια*, in Antiquity, two festivals, one of which was celebrated in Cæro, in honour of Europa, called *Hellosia*; the other was celebrated by the Corinthians, with solemn games and races, wherein young men contended, running with lighted torches in their hands. See a farther account of these festivals in *Post. Archæol. Græc. lib. ii. cap. 20. tom. i. p. 393.*

HELLOITIS, *Ἑλλώτις*, in Antiquity, a myrtle garland, carried in procession with Europa's bones at the festival called *HELLOTIA*.

This garland was no less than twenty cubits in circumference.

HELM, in Sea-language, is a long and flat piece of timber, or an assemblage of several pieces, suspended along the hind-part of a ship's stern-post, where it turns upon hinges to the right or left, serving to direct the course of the vessel. The *helm* is usually composed of three parts, viz. the *RUDDER*, the *TILLER*, and the wheel, except in small vessels, where the wheel is unnecessary.

HELM, *relle the*. See *A-LEE*.

HELM, *bear up the*. See *BEARING*.

HELM, *raise the*. See *RAISE*.

HELM, *put the*. See *PORT*.

HELM, *right the*, or *helm the midship*. See *RIGHT*.

Shifting the HELM. See *SHIFTING*.

HELM, *sharpened the*. See *STARBOARD*.

HELM, in Chymistry, is the head of a still or alembic; thus called, because in figure it sometimes resembles a *helm* or helmet.

Hence, to bring the thing *over the helm* is the same as to force it by fire up to the top of the vessel, that it may distil down into the receiver by the beak of the head.

And when they say, such a thing cannot be brought over the *helm*, they mean that it is of too fixed a nature to be raised into vapour by the force of fire.

HELM, a term used by country people for straw, bruised by threshing or otherwise, and bound up in bundles for stanching. See *THATCH*.

HELMET, or **HELM**, an ancient armour of defence, worn by the cavaliers, both in war and in tournaments, as a cover and defence of the head; and still used by way of a crest or ornament over the shield or coat of arms.

The *helmet* is known by divers other names, as the *vest*, *head-piece*, *steel cap*, &c.

The *helmet* covered the head and face, only leaving an aperture about the eyes, secured by bars, which served as a visor.

The *helmet* is borne in armoury as a mark of nobility; and by the different circumstances of the bearing of the *brim*, are the different degrees of nobility indicated. In France, whence all our heraldry originally came, the following rules obtain.

A person newly ennobled, or made a gentleman, bears over his escutcheon a *helmet* of bright iron or steel, in profile, or standing sideways; the visor quite close.

A gentleman of three descents bears a little open, but still in profile, showing three bars of the visor.

Ancient knights, &c. have it in profile, but showing five bars: the edges of silver.

A baron's *helmet* is of silver; the edges gold, with seven bars neither quite in profile, nor yet in front, with a coronet over it adorned with pearls.

Viscounets and earls formerly bore a *helmet*, with gold edges, its position like the former: but now they bear it quite fronting, with a coronet over it.

Marquises bear a silver *helmet*, damasked, fronting; with eleven bars, and their coronet.

Dukes and princes have their *helmet*, damasked, fronting, the visor almost open, and without bars, with their coronets over them.

Lastly, the *helmet* of kings and princes are all of gold, damasked full fronting, and the visor quite open, and without bars.

The *helmet* of barons are to be turned to the left, to denote their baseness.

Among the English heralds, these laws are of late somewhat varied. Knights will have the *helmet* profile and close to belong to knights; but all other authors give it to equites and gentlemen. See III. Heraldry, fig. 91.

To a knight's and baron's, they assign the *helmet* standing right forward, with the beaver a little open, and without bars. Fig. 92.

The *helmet* in profile, or pointed sideways, and open, with four bars, belongs to a nobleman under the condition of a duke. Fig. 93.

The *helmet* right forward and open, with many bars, is assigned to dukes, princes, and kings: that appropriated to dukes and marquises has five bars, one exactly in the middle, and two on each side, (fig. 95.) whereas the king's *helmet* has six bars, three on each side. Fig. 91.

Those turned sideways are supposed to be giving ear to the command of their superiors; and those right forward, to be giving orders with absolute authority.

Commonly there is but one *helmet* in a shield; but sometimes there are two or three: if there be two, they must be placed facing each other; if three, the two extremes must be looking towards that in the middle.

HELMET-PLUMES, in *Botany*. See ACORNITE and WOLF'S-HEAD.

HELMET-PIGEON, the name given to a particular species of pigeon, called by Moore the *columba palacea*. It has its name from its having its head covered with a plume of a distinct colour from that of the rest of the body, and appearing somewhat like a *helmet* covering the head.

It is a moderate sized pigeon, a little bigger than the species called the *haze*. The head, tuft, and slight-feathers of the wings, are always of the same colour, which is either black, red, or yellow, and sometimes, though rarely, blue; the rest of the body is all white. They are docile, and have no hood like that of the *haze*, otherwise they approach much to that species. Moore's *Columbarum*, p. 48.

HELMET-BIRD, in *Natural History*. See GALEA.

HELMINTHOGA, of *snake*, *worm*, and *eye*, I call medicines contrived to destroy and expel worms.

HELMINTHES, in the *Medical Writers*, a word used to signify the worms in human bodies.

HELMINTHOTHUS, of *snake*, *worm*, and *side*, *flame*, in *Natural History*, a name given by Linnaeus to petrified bodies resembling worms. Of these he enumerates twenty-four different genera.

HELMINTHOTHES, in *Botany*, a name given by Vaillant to a genus of plants, first described by Linnaeus under the name *PICES*.

HELMONTII, *Indian*. See LUDUS *Helmontii*.

HELODES, formed of *ox*, *marly*, in *Natural History*, a term applied to certain plants, to signify their place of growth to be in fens, bogs, or marly places; thus a kind of St Peter's wort, which is distinguished from the others by being hairy, and growing always in boggy places, is called by Ray and others, *aletrum caliginis Lelandi*.

In *Medicine*, the same word, or *elodes*, is used as a characteristic epithet in certain fevers. These are such as are attended, in their beginning, with profuse sweats, which afford no relief; and all the time the tongue is dry, and the skin hard, and as if it were parched. These are usually of dangerous consequence.

HELODIA, in *Botany*, a genus of the *Linaria* tripartita class. The characters are, that the corolla has six petals, that it has no calyx, and the fruit is a three-celled capsule. There are two species.

HELOPS, in *Ichthyology*, the name of a fish which often occurs in the old Greek and Latin writers. Aristotle, Elean, Ovid, and others, mention it. It seems to have been the same with their oniscus and acrocephus, which was

our STURGEON. Pliny's account of the *helops* counterpoises this opinion.

HELOSIS, of *eyes*, I felt up, in *Medicine*, the name of a disorder of the eyes, attended with an eversion, or turning up of the eyelids.

HELOTIS, a name given by some authors to a disease called *pitca Palencia*.

HELOTS, in *Antiquity*, a kind of slaves, among the Lacedaemonians, so named from Helos, a Lacedaemon town, conquered by the Spartans, who made all the inhabitants prisoners of war, and reduced them and their posterity to the condition of slavery.

On these slaves lay the whole care of supplying the city with provisions; the ground was tilled, and all manner of trades managed by them; whilst their masters spent all their time in dining and feasting, in their exercises, hunting-matches, and the *hagya*, or places where good company used to meet. Notwithstanding the great usefulness of the *Helots*, they were treated in a most barbarous manner, and often murdered without committing any fault, and without any show of justice. Pott. *Archaeol. Graec. lib. i. cap. 10.*

HELPS, in the *Manège*. To teach a horse, his lessons, there are seven *helps* or aids to be known: these are the *voice*, *red*, *bit* or *passive*, the *calves* of the legs, the *stirrup*, the *spur*, and the *ground*. See *ARMS*.

The *helps* are occasionally turned into *CONNECTIONS*.

HELPESED, in *Natural History*, a name used by some writers for *COARSE*.

HELSEBON, an affected word, used by some of the chemical writers to express common sea-salt, well purified by solution and rectification.

HELISINGI, *character*, a character inscribed on some stones found in Helsingland, in the north parts of Sweden. It differs from the Runic; though one of these characters may easily be transformed into the other. See *RUNIC*.

HELVE, the handle of a hatchet, pick-axe, mattock, &c. and to *helve* these is to put handles to them.

HELVELLA, in the *Linnaean System of Botany*, a genus of the *cryptogamia fungi*. See *TURBACITIS*.

HELVETIC, something that has a relation to the Switzers or inhabitants of the Swiss cantons, who were anciently called *Helvici*.

The *Helvetic* body comprehends the republic of Switzerland, consisting of thirteen cantons, which make to many particular commonwealths.

By the laws and customs of the *Helvetic* body, all differences between the several states and republics are to be decided within themselves, without the intervention of any foreign power.

The government of this body is chiefly democratic, with some mixture of the aristocratic.

HELVIDIANS, a sect of ancient heretics denominated from their leader Helvidius, a disciple of Aeneas the Syrian, whose distinguishing principle was, that Mary, the mother of Jesus, did not continue a virgin, but had other children by Joseph.

The *Helvidians* are called, by the Greeks, *ANTIDOCIMARIANITES*.

HELVINE, in *Botany*, a name used, by some authors, for the parietaria, or *PELLISTORY* of the wall.

HELVINE, *cissampylis*, in *Botany*, a name given by some authors to a species of bindweed, called by Mr. Tournefort *convolvulus major alius triflorus* & *convolvulus folio maritimo*; the great white-flowered sea bindweed, with thick auriculated leaves. See *CONVOLVULUS*.

HEM, a partition in the ovens, wherein the *lepis columbaria*, or *columine*, is baked. These ovens have a hearth made on one side, divided from the oven itself by a partition, or *hem*, open at the top, by which the flame passes over, and to heats and bakes the *columine*.

HEMATOPUS, in *Ornithology*, a name used by Bellonius and some others, for the bird commonly known in England by the name of the *screeper*, and called by Mr. Ray and some authors *PICA MARINA*.

HEMEROPHASTS, a sect among the ancient Jews, thus called from their walking and bathing every day, in all seasons; and performing this custom with the greatest solemnity, as a religious rite necessary to salvation.

Epiphanius, who mentions this as the fourth hereby among the Jews, observes, that in other points these heretics had such the same opinions as the Scribes and Pharisees; only that they denied the resurrection of the dead, in common with the Sadducees, and retained a few other of the improprieties of their law.

The sects who pass in the East under the denomination of Sabians, calling themselves *Mahadi Jinni*, or the disciples of John, and whom the Europeans entitle the Christians of St. John, because they yet retain some knowledge of the Gospel, is probably of Jewish origin, and seems to have been derived from the ancient *Hemerophasts*; at least it is certain, that that John, whom they consider as the founder of their sect, bears no sort of

similitude

similitude to John the Baptist, but rather resembles the person of that name, whom the ancient writers represent as the chief of the Jewish *Hemerobaptists*. These ambiguous Christians dwell in Persia and Arabia, and principally at Bassora; and their religion consists in bodily washings, performed frequently, and with great solemnity, and attended with certain ceremonies which the priests mingle with this superstitious service. Mollheim's *Ecl. Hist.* vol. iii. p. 408, 8vo. 1758.

HEMEROBATUS, in *Zoology*, a genus of insects of the *neuroptera* order; the characters of which are, that the mouth has two tentacula, the wings are deflex, without folds, and the antennae are longer than the convex thorax, setaceous, and extended. There are fifteen species. See *Curr. Zooz.* 12.

HEMEROCALIS. See *LICY*.

HEMERODROMI, compounded of *hēma*, day, and *dromos*, race, &c. among the *Ancients*, were centinels, or guards, appointed for the security and preservation of cities, and other places.

They went out of the city every morning, as soon as the gates were opened, and kept all day patrolling round the place; sometimes, also, making excursions farther into the country, to see that there were no enemies lying in wait to surprise them.

HEMERODROMI were also a sort of couriers, among the *Ancients*, who only travelled one day, and then delivered their packets, or dispatches, to a fresh man, who ran his day, and so on, to the end of the journey.

The Greeks had of their sort of couriers which they derived from the Persians, who were the inventors thereof, as appears from Herodotus. Augustus had the same; at least he established couriers, who if they did not relieve each other from day to day, yet did it from space to space, and that space was not very great.

HEMEROTROPHIS, in *Antiquity*, a measure of capacity, the same with the *CHOREN*.

It was so called from its holding one day's food.

The word is compounded of *hēma*, a day, and *trophē*, food. **HEMEROLOPIA**, or *hēma*, day, and *lopiā*, a distemper, a disease of the eyes, by means of which persons can only see in broad day-light, and not distinguish objects at all in the dark of the evening. It is owing to a great contraction of the pupil.

HEMI, a word used in the composition of divers terms. It signifies the same with *semi* or *dimid*, viz. half, being an abbreviation of *hemisphaerium*, which signifies the same. The Greeks retrenched the last syllable of the word *hemisphaerium*, in the composition of words, and after their example, we have done so too, in most of the compounds borrowed from them.

HEMICRANIA, *Hēmicrania*, in *Medicine*, a species of cephalalgia, or head-ach; wherein only one hemisphere, or half, or one side of the head, is affected; and owing to a congestion of blood in the vessels of that half.

Physicians divide the *hemisphaerium* into four kinds. 1. The idiopathic, when it is properly a disease of itself. 2. The symptomatic, where it is properly only the symptom of some other disease. 3. The continual or fixed, where it admits of no absolute intermissions. And, 4. The periodical, where the patient is regularly free from it at certain stated periods.

Signs of it. Among these are vibrative and very acute pains: the pain occupies only one part of the head, while the other part is wholly free and at ease. The left side of the head is usually the part in pain. In that side of the head where the pain is, it is not fixed to any one spot, but wanders up and down from one part to another; and sometimes the eye on that side, sometimes the jaw and teeth are affected by it. When the lower part of the head is in pain, the upper part is somewhat easy; and in some cases the pain has been known to descend to the arm of that side. To this it is to be added, that the patient is usually collared, and makes very little urine. Women are much more subject to this distemper than men, and among them principally such as live high, and use little exercise: such as are subject to violent passions of the mind, such as have had frequent suppressions of the menses; and such as live in a married state without having children.

The principal cause of the distemper is a plethora, occasioned usually by a suppression of the menses, or hemorrhoids, or some other natural evacuation, or the omission of habitual bleedings at spring or fall. To these causes are to be added a distemperature of the primæ viæ, and consequent acidities or indigestion, a change of the course of life from one full of exercise to a sedentary one; excessive watchings or studies; too great heat of the body, or too sudden cooling of it; violent passions, as of anger, or the like, suppressed; and, finally, too high living, and the free use of strong liquors.

Pregnities. This species of head-ach not unfrequently brings on suffusions, and other disorders of the eyes, and

often is a fore-runner of the gout, especially if it be imprudently treated during the fit; if the congestion of blood be driven by repellents at this time to the feet, it continues that painful distemper; but if it fall upon the viscera, it usually brings on an inflammatory fever. When it extends to the arm and side of the affected half of the head, there is danger of a palsy coming on. In itself it is not difficult to cure in young people; but in women advanced in years, after the cessation of the menses, it is scarce ever perfectly cured so as not to return.

Manner of cure. As the primæ viæ are almost always obstructed in this complaint, the regular beginning of a cure is by emptying them; and a gentle vomit and purging medicines are to be given. Stool sévices, to answer both these purposes at once, by rhubarb and castile soap mixed together. After the emollient clysters are to be given, then the violent motion of the blood is to be quieted, by giving powders composed of nitre, scrabicyes, and cinabar; and in cases where the pain is violent and unsufferable, a gentle opiate may be given; such as a small dose of the thorax pill; and at other times the quantity of the cinabar may be increased from five grains to ten or twenty in a dose; and this will supply the place of the opiate, and procure the same effect in giving ease. After the bowels have been sufficiently cleaned, chalybeate waters, and such bitters to strengthen the stomach, will be necessary. Spirit of wine camphorated may also be used externally; and frequently bathing the feet in the decoctions of the warm and emollient herbs, has a great effect. In the absence of the fit, the methods to be used, by way of prevention, are bleeding in the arête, to remove the plethora; and where the suppression of the menstrual, or any other discharge, has been the cause, this is to be restored, if possible, to its wonted periods; and in all cases a sedentary life is to be avoided. Bleeding is never proper in the time of the fit, unless the plethora be very great, or the congestion in the head so great, that worse consequences are to be feared.

Junker, *Comp. Med.* p. 118.

HEMICYCLE, *Hēmicyclum*, compounded of *hēma*, half, and *κύκλος*, circle, a **HEMICIRCLE**.

HEMICYLE is particularly applied, in *Architecture*, to vaults in the cradle form; or arches, or sweep, of vaults, constituting a perfect femicircle.

To construct an arch of hewn stone, they divide the *hemicycle* into so many modules, taking care to make them an uneven number, that there be no joint in the middle, where the key-stone should be. See *KEY* and *BUTTOCK*.

HEMICYCLUM was also a part of the orchestra in the ancient theatre. Staliger, however, observes, it was no standing part of the orchestra; being only used in dramatic pieces, where some person was supposed to be arrived from sea, as in *Plautus's Rudens*.

The ancients had also a sort of sun-dial called *hemicycleum*. It was a concave femicircle, the upper end, or culpe whereof, looked to the north.

There was a style, or gnomon, issuing from the middle of the *hemicycle*, whereof that point corresponding to the centre of the *hemicycle*, represented the centre of the earth; and its shadow projected on the concavity of the *hemicycle*, which represented the space between one tropic and another, the sun's declination, the day of the month, hour of the day, &c.

HEMINA, formed of *hēma*, half, a vessel used as a measure among the ancient Romans, containing half the sextary. The *hemina*, called also *cistella*, and *acetabulum*, contained eight ounces of liquor and was the twelfth part of the congius.

Several authors have wrote express treatises on the Roman *hemina*; particularly Meib. Arnaut and Pelletier. St. Benedict prescribes the *hemina* as the portion or quantity of wine to be allowed the religious of his order at each meal. F. Mabillon, who has wrote on the subject, shews that this *hemina* was a measure peculiar to the Benedictines, as well as the pound of bread allowed the same religious, which only consisted of fifteen ounces. F. Lanctot has a dissertation to prove, that the *hemina* of wine prescribed by St. Benedict, only amounts to a demi-septer of Paris measures; but others make it two septiers, and others three.

HEMIOBOLON, a weight often mentioned by the ancient writers in medicine; and expressing the half of their obolus, or the twelfth part of a dram, that is five grains.

HEMIOLIOS, or *Hēmiolus*, compounded of *hēma*, half, and *λίος*, whole, an ancient mathematical term, occurring chiefly in musical writers. It signifies the ratio of two things, whereof the one contains the other once and a half; as 3 to 2, or 15 to 10; otherwife called *sesquialtrate*.

See **RATIO**, and **SEQUIALTRATE**. Macrobius, on the *Somnium Scipionis*, lib. ii. cap. 1. observes, that the concord, called in the ancient music *diapente*, and in the modern a *fifth*, arises from this proportion.

HEMI-

HEMORRHOIDS, of *hemorrhoides*, a *male*, *male* or *male*-fem, in the Linnaean system of *Bleeding*, the name of a genus of *ferus*, the character of which is, that the *hemorrhoids* are disposed in branched lines, or such as intermix with and intersect one another.

The characters of *hemorrhoids*, according to Tournefort, are these: the flowers are not discovered, but the seeds stand in clusters on the back part of the leaves; the leaves are all furnished with broad awicles at their base, and are in some species simple, and in others branched or compound. Tournefort, p. 516.

The species of *hemorrhoids*, enumerated by Mr. Tournefort, are thirteen; and by Linnaeus three.

HEMIOPE, or **HEMIOPE**, compounded of *hemis*, half, and *ope*, hole, a musical instrument in use among the ancients.

The *hemiope* was a flute with only three small holes. **HEMIPAGIA**, a pain that affects only one half of the head; the same as *hemiplegia*.

HEMIPLEGIA, or **HEMIPLEGIA**, compounded of *hemis*, half, and *plegia*, stroke, or *stroke*, in Medicine, a palsy of one whole side of the body. See PALSY, and Medical ELECTRICITY.

HEMIPTERA, derived from *hemis*, half, and *ptera*, wing, in the Linnaean system, the second order of insects, comprehending twelve genera, viz. the *blatt*, *mantis*, *pyris*, *scutigera*, *scutigera*, *scutigera*, *scutigera*, *scutigera*, *scutigera*, *scutigera*, *scutigera*, and *scutigera*, and a great number of species. The characters of this order are, that the mouth is either situated in the breast, or inclined towards it; and that the upper wings are semi-membraceous, semi-membraceous, and imbricated, and not connected by a straight longitudinal suture, as in the order of COLEOPTERA.

HEMISPHERE, **HEMISPHERUM**, compounded of *hemis*, half, and *sphaera*, sphere, in Geometry, is one half of a globe, or sphere, when divided into two by a plane passing through its centre.

If a diameter of a sphere be equal to the distance of the two eyes; and a right line drawn from the centre of the sphere to the middle of that distance be perpendicular to the line which joins the eyes; the eyes making a rotation on the axis, or middle point between them, will see the whole hemisphere. If the distance of the eyes be either greater or lesser than the diameter of the sphere, in making such rotation they will view respectively more or less than a hemisphere. See VISION.

The centre of gravity of a hemisphere is five eighths of the radius distant from the vertex.

HEMISPHERE, in Astronomy, is particularly used for one half of the mundane sphere.

The equator divides the sphere into two equal parts, called the northern and southern hemispheres. The northern hemisphere is that half in whose vertex is the north pole. Such is that represented by DPA, Tab. Astronomy, fig. 2; terminated by the equator DA, and having the pole P in its zenith.

The southern hemisphere is that other half DQA, terminated by the equator DA; and having the south pole Q in its zenith.

The horizon also divides the sphere into two hemispheres; the upper and the lower.

The upper hemisphere is that also of the mundane sphere HZR, terminated by the horizon HR, and having the zenith Z in its vertex.

The lower hemisphere is that other half HNR, terminated by the horizon HR, and having the nadir N in its vertex.

HEMISPHERE is also used for a map, or projection, of half the terrestrial globe, or half the celestial sphere, on a plane. Hemispheres are frequently called planispheres.

HEMISPHERIA, a name by which Dr. Hill calls the genus of flies known in English by that of *hemi*, or *hemi*.

Ray, and other writers, have described these among the beetles. See SCABIEUS.

HEMISPHEROIDAL, in Geometry, something that approaches to the figure of a hemisphere, but is not justly so.

HEMISTICH, compounded of *hemis*, half, and *tich*, verse, in Poetry, a half verse.

Such, e. g. art, *Cervix Dentis* *imud* *windu*— or *Adit* *tuifinus* *itis*, &c. It is disputed, whether or no the hemistichs in the *Æneid* were left with design; or whether they are owing to the work's being unfinished?

In English, &c. the common and Alexandrine verses require a rest at the end of each hemistich; common verses require it at the end of four syllables; and Alexandrine at the end of six.

Leonine verses rhythm both at the end and at the hemistich. See LEONINE.

HEMITONE, in the *Acoustics*, was what we now call a half-note, or semi-tone.

HEMITRITHEUS, *Hemitritheus*, compounded of *hemis*, half, and *trithea*, three; or, as modern Latin authors express it, *hemitritheus*, in Medicine, an irregular intermitting fever, which returns twice every day; by which it is distinguished from the quotidian, which only returns once in the day.

HEMISTON, a measure among the ancients, containing half a xestes. The xestes contained two cotyles; and therefore the hemiston was a cople.

HEMLOCK, *Conium*, in History, a genus of the *solanacea* *serena* class. Its characters are these: it is an umbelliferous plant; the petals of the greater umbels are uniform; each flower is composed of five unequal heart-shaped petals, which turn inward, and have five stamens; the germ, which is situated under the flower, supports two reflex styles, and becomes a roundish channelled fruit, divided into two parts, containing two seeds. There are three species, the greater hemlock, with striated seeds; and smaller leaves, the greater hemlock with narrower leaves, and the hemlock with prickly seeds.

The first and common sort grows naturally on the sides of banks and roads in many parts of England; and is a biennial plant, perishing after it has opened its seeds; it hath a long taper root like a parsnip, but much smaller; the stalk is smooth, spotted with purple, and rises from four to six feet high; branching out toward the top into several stalks, which are garnished with decomposed leaves, whose small leaves are cut at the top into three parts; these are of a lucid green, and have a disagreeable smell; the stalks are terminated by umbels of white flowers, each being composed of about ten rays, or small umbels, which have a great number of flowers spread open, each sitting upon slender footstalks; the seed is small, and channelled like those of mife.

Hemlock is seldom allowed room in gardens, being supposed to have a poisonous quality: some physicians have asserted that it is so to all animals, while others have asserted that it is eaten by the inhabitants of some parts of Italy when it is young, and is by them esteemed a great salu. Mr. Ray tells us, that he found the gizzard of a thrush full of hemlock seeds, with four or five grains of corn intermixed, which is the time of harvest that bird had neglected for what we reckon to be very pernicious. However, it is very certain that scarce any animal will eat the green herb.

This plant is esteemed by many physicians as an excellent remedy to dissolve scirrhus tumors; and some have greatly recommended it for cancers: most of them agree that it may be prescribed as a good narcotic.

We are chiefly indebted for the knowledge of the beneficial effects of hemlock to the experiments of Dr. Storck, physician at Vienna, in account of which was published in the year 1766. This ingenious writer relates, that he took of the dry leaves, culled together, boiled for a few minutes in water, or milk, then squeezed from the superfluous liquid, and applied warm, checked the progress of very bad gangrenes, and procured a suppuration of the corrupted parts; that the same application abated the pains of an obstinate gout, and dissolved the tophaceous concretions; and that it effected were likewise considerable in cedematous tumors, scirrhus thymæ, indurations of the glands of the breast, and in very bad cancers; and that plasters, containing the juice of hemlock, often resolve and disperse what resists all other applications. With us this herb has been chiefly used in the form of plaster, prepared by mixing the recent juice with a solution of twice its quantity of gum ammoniac, made in vinegar of quills, and boiling down the mixture to a due consistence.

For internal purposes, Dr. Storck directs the fresh juice to be inspitulated in an earthen vessel over a very gentle fire, till it acquires the consistence of a thick extract; which is to be mixed with as much of the powdered leaves as will reduce it into a mass for pills. This preparation produced very powerful and salutary effects in some diseases that were reputed incurable, acting, though slowly and insensibly, as a hard resolute. He relates histories of inveterate fistulous ulcers, and the worst kinds of ulcers and fistulas, being completely cured by it; and says, that it also resolves recent catarrhs, or at least retards their progress. He begins always with small doses, giving one pill of two grains, first twice a day, then three a day, and gradually increasing the number to six or more for a dose. The good effects of the medicine were sometimes visible in a few days, though the cure generally required several months.

It appears from several late trials of this medicine, both in England and Ireland, particularly by Dr. Fothergill and Dr. Rusty, that, though it is far from answering the high expectations which Dr. Storck had formed of it, it may, nevertheless, be a very useful acquisition, and may assist in curing or alleviating disorders, in which the common medicines

dicines are insufficient. In real cancers, whether ulcerated or occult, there is no influence of its effecting a complete cure; but it has been found to retard the progress of this disease, to mitigate the pain, and to change the thin, ichorous, fetid discharge, to a flatter more approaching that of laudable pus. In different kinds of ulcers it likewise mended the discharge, and disposed the ulcers to heal. Some scrophulous tumours have been completely resolved by it, and the cure has stood for several seasons; in other cases of this kind, the patient has frequently relapsed, especially in the spring. Dr. Fothergill observes, that the success of this medicine depends on its being given in as large a dose as the patient can bear; that the *hemlock* is in greatest perfection when the flowers begin to fade, and the habit of the plant inclines to yellow; and that in making the extract, the less heat it undergoes, the better; that he has found twenty grains of one sort of extract equal in efficacy to near forty of another; that the dose is to be increased by degrees, till it produces certain effects, which seldom fail to attend a full dose, and which are generally a goldenness of the head, and motions of the eyes, as if they were pulled outwards, or a slight thickening and trembling agitation of the body, or a laxative stool or two; that here we must stop till these effects subside, and in three or four days advance a few grains more; that a greater quantity can commonly be borne at night than at noon, and at noon than in the morning; that the method he usually pursues is to order two drams of the extract to be made into thirty pills, of which two are to be taken in a morning, two at noon, and three or four at night, and one pill added to each dose, as the patient can bear it; that the extract, given in this manner, is apparently anodyne, promotes rest, and eases pain; seldom creates thirst, or that kind of morning head-ach which succeeds an opiate; rarely occasions coliciveness, but in most cases procures a laxative stool the next day; that in some habits very small drops offend the stomach, excite spasmodic twitchings, heat, and thirst; and that in such cases its use is immediately forbid. *London Med. Diss. and Inq. vol. lii. p. 210. and p. 405. See also in p. 353, Dec. vol. v. p. 113, &c.*

The root of *hemlock* is generally supposed to have greater activity than the leaves, both when applied externally, and when taken internally. The juice applied in a drop or two to the tongue, will occasion rigidity, pain, and swellings, in an attempt to prevent speech, which Dr. Boerhaave may be corrected by washing and rubbing the tongue with citron juice. In drying it loses its violence; and there are instances, in which twenty and thirty grains have been given, with advantage, in febrile affections of the liver, in quantum aqua on the approach of a fit, and even in acute fevers. The seeds have been recommended by some as demulcent, pectoric, and antiparodiac. *Levi's Mat. Med.*

HEMLOCK, legend. See LOTAGUS.

HEMLOCK, *lyris*, *Althaea*, a genus of the *pentandria digynia* class. This is also called foot's pusley, and is a kind of poisonous weed frequently found in gardens and rich ground. It may be distinguished from parsley by the narrowness of the small leaves, which are also more pointed, and of a darker green.

HEMLOCK, water, *Cicuta*, a genus of the *pentandria digynia* class: the characters are, that it has an umbellated flower; the principal umbel is composed of several smaller, called rays, and has no involucre, as the smaller have; the flowers have each five petals, nearly equal, turning inward, and five hairy stamens; the germs are situated below the flower, and supports two slender styles, which are permanent, and longer than the petals, and afterward becomes a roundish channelled fruit, dividing in two parts, containing two oval seeds, plain on one side and convex on the other. There are two species, one of which grows naturally to the height of near four feet, in stagnant waters, in many parts of England. It has a branching hollow stalk, garnished with winged leaves; the stalks are terminated by umbels of yellowish flowers, which are succeeded by small channelled seeds, like those of parsley. It flowers in June and July, and the seeds ripen in autumn.

The leaves are commended by Blaneard in virulent inflammations of the penis; internally, it is an emetic. It is supposed to be much like the common *hemlock* in its nature and quality, but more poisonous; it is therefore very seldom used in the shops. *Wether* has wrote a treatise entirely on this plant. *Miller*.

The *CICUTA* so much celebrated among the ancients was the juice of a species of this plant, called *scantia aquatica* *triste* *foetida*.

The second species grows naturally in North America.

HEMLOCK drop-wort, see WATER DROP-WORT.

HEMP, *Conopsea*, in *Betony*, a genus of the *disticta* pen. Vol. II. N° 169.

tandria class. Its characters are these: it is male and female in different plants; the male flowers have a five-leaved concave empanement, without petals, but have five short hairy stamens, terminated by oblong, square filaments; the female flowers have permanent empanements, of one leaf, without petals, but a small germs, which afterward becomes a globular depericled seed, enclosed in the empanement. We have but one species of this plant, which is propagated in the rich feney parts in Lincolnshire in great quantities, for its bark, which is useful for cordage, cloth, &c.

Hemp bears a near analogy to *flax*, *linum*; in respect of form, culture, and use. It rises quick into a tall, slender sort of shrub, whose stems however is hollow, and big enough to be charred; and is often thus used in the composition of gunpowder. Its leaves arise by fives or sixes from the same pedicle, and are a little jagged; yielding a strong smell, which affects the head. Its flowers grow in clusters, opposite to each other, in manner of a St. Andrews cross; each consisting of five yellowish stamens, encompassed with a like number of petals, purple without, and white within; its fruit, or seed, is small and round, filled with a white soft pulp, and grows on the top of the stem, having its stalks distinct from those of the flowers; lastly, its bark is a trifling of fibres, joined together by a soft matter, which easily rots away.

Hemp is always sowed on a deep, moist, rich soil, such as that of Holland, Lincolnshire, and the fens in the Isle of Ely, where it is cultivated to great advantage, as it might in many other parts of England, where there is the like soil; but it will not thrive on cold clay, or stiff cold land. It is esteemed very good to destroy weeds, which is no other way effected but by robbing them of their nourishment; for *hemp* greatly impoverishes the ground; so that this crop must not be repeated on the same land. *Miller*.

The best *hemp*-seed for sowing, is that which looks brightest, and which will retain its brightness, and not break when rubbed. It should be always of the growth of the preceding year, and every second or third year taken from a different soil. Three bushels of seed are the general allowance for an acre; but the richer the land is, the thicker it should be sown; and the poorer, on the contrary the thinner sown. Some people only give the land one ploughing for *hemp*, which is just before they sow it; but others prepare it as finely as the gardeners do their mould. For this purpose it should be ploughed once in the preceding autumn, and two or three times in the spring; and after the last spring plowing in February, it should be well manured; though M. Du-Hamel recommends the laying on of the manure before the winter ploughing; that the dung may rot on the ground, and be afterwards thoroughly mixed with the earth by the spring ploughings. The time for sowing *hemp* is from the beginning of April till the end, and the best season is just after a gentle fall of rain. The seed must not be buried, but only just covered in the ground. When *hemp* is chiefly cultivated for the seed, it is sown the best way to sow it thin; and if the plants are raised on ridges, and horse-hoed, the seed will be superior to what is obtained from broad-cast *hemp*; and with respect both to seed and *hemp*, it will be best to drill it in equidistant rows, and to hand-hoe it, which will improve both the land and crop; and less manure will suffice than when it is sown by hand. If it be sown in a dry time, it must be at first carefully preserved from the birds, which are great devourers of the seed before it shoots. When the plants are come up, they should be hoed out like turnips, leaving the plants twelve or fifteen inches apart, and cutting down all the weeds. This crop will require a second hoeing about a month or six weeks after the first, in order to destroy the weeds; after which the *hemp* will soon cover the ground, and prevent the growth of weeds.

An acre of *hemp* in the best land yields from two to three quarters of seed; and this seed, with the *hemp* unwrought, is worth from six to eight pounds; and if the *hemp* be wrought from ten to twelve pounds, or more; but the male, or *finch-hemp*, is not worth more than half as much as the other. The growing of *hemp* on proper lands would not only be a great advantage to the farmers, but also to the poor, as it would give them a second harvest after the corn-harvest was over, and which would employ them even in wet seasons; yet it is a piece of husbandry too much neglected among us.

It does not appear, that the ancients were acquainted with the use of *hemp*, in respect of the thread it affords. *Pliny*, who speaks of the plant in his *Natural History*, lib. xx. cap. 23. says not a word of this; contenting himself with extolling the virtues of its stem, leaves, and root. In effect, what some writers of the Roman antiquities remark,

H E M

mark, viz. that the *hemp* necessary for the use of war was all stored up in two cities of the western empire, viz. at Ravenna and Vienne, under the direction of two procurators, called *procuratores linteis*, must be understood of linum, or flax.

The culture and management of *lamp* makes a considerable article of agriculture, there being divers operations required therein: as *pulling*, *watering*, *beating*, *fining*, &c.

The first task for pulling the *kump* is about the middle of August, when they begin to pull the male plants, which the farmers call the *male-kump*; but Mr. Miller says it would be better to defer this for a fortnight or three weeks longer, till these male plants, which contain the *forma farinacea*, have shed their dust, without which the seeds will prove abortive, produce nothing if sown the next year, and fetch no price at the oil-mills, because they are only empty husks, without any kernel for yielding the oil; but they begin to decay after having shed their tannin. The signs of its maturity are the yellowness of its leaves, and the whitiness of its flax. The remaining plants, which are the female *kump*, called by the farmers *far-kump*, are to be pulled a little after Michaelmas, when the seeds are ripe. The ripeness of the female *kump* is known, not only by the flame tinge to that of the male, but also by the seeds beginning to turn brown, and by the capsules which contain them beginning to open.

The way of gathering it, is to pull it up by the roots, after which they kindling in handfuls, or bundles. The female lays her eggs eight or ten days in the air, that the food may dry and ripen; after which they cut off the heads, and beat or thresh them, to get out the seeds. The feed which falls out is still in always rippled and bed, and should therefore be reserved for sowing the next spring; and as to that which remains in the heads after this operation, it is got out by combing the heads on the teeth of a ripple, which pulls off the flares, the hulls of the seeds, and the seeds themselves, all together. These are gathered in a heap, and left in that condition for a few days, in order to their heading a little, after which they are spread out to dry; then they are threshed, and the seeds are separated by winnowing and sifting. This second feed is much inferior to the first, and accordingly it is used only for extracting oil from it, or feeding of poultry. They also beat the male, to get out a husk, still, feed for of dull contained therein.

This done, they proceed to *water or rate it*, by laying it five or six days in a pool, or other stagnant water, to rot the bark &c. so that it may be the more easily separated from the resin. A stream, or running water, would do the business much better, but that it infects the water, and gives it a quality very pernicious to the health; for which reason it is forbidden to use it in any waters used for domestic purposes.

When it is sufficiently heated, and taken out again, they dry it; for which there have been various contrivances. In many parts of France they dry their hemp in a kind of oven, described by M. Du-Roi and Mercandier, which is generally six or seven feet high, five or six feet wide, and nine or ten feet long. At about four feet above the floor of this drying place, and two feet from its entrance, three bars of wood, about an inch thick, are placed across the cavern, from side to side, and there fixed. On these bars the hemp is laid about six inches thick, and under it is kept a small fire made of the fragments of the wood of hemp that has already been broken or peeled. When a small quantity of hemp is to be dried, an oven, of a moderate heat, is the safest method; and when the quantity is greater, it is usual to dry it on a kiln, and the bell fuel that can be used for this purpose, is coals.

When the *long* is sufficiently dried, they proceed either to pick, by taking one flake after another, breaking the root, and dipping out the bark, or to break or *break* it. The last, which is the woolly part of the fleece, from the tip of the bark which covers it, is performed three ways, viz. by beating the wool with becks, which is laborious and tedious; or by a toothed instrument called a *brake*, beginning with the root and so on, which is the best method; by spun rollers, that are wrought by horse, wind, or water. The Moroccan wool used in America is a good instrument for this operation: it consists of a large, heavy cone, shaped like a sugar-loaf, with the small end out; this is moved by a water-mill, and the *long* being laid on the floor, is bruised by the weight of the cone pulling over it. Mr. Robert Macpherson, assistant secretary to the commissioners and trustees for improvements in Scotland, has lately invented a new water-mill, and foot machine, for breaking, scouring, and beating flax and hemp.

HEN

When the bun is sufficiently broke, and hangs by small slivers, they *twinge, fawn*, or beat it out with a piece of wood, edged for the purpose, called a *twing-bone*, or *finster*. But this operation is now performed more expeditiously by means of water-mills, in which several scutches, fixed in the same axle-tree, are moved with great velocity. The intention of this process is to separate the feces from the *bunp*. Note, the *hard-bunp* they sometimes break with the fingers and strip off the rind, without the help of the beak or twinge.

the great thing is to *steep, or bathe, the hemp*, which is done either on a block, or in a trough, with a hammer, or with beetle, till it feels sufficiently soft and pliable. The beetles used for this purpose are moved either by hand or by water. M. Mercander, in his *Treatise on Hemp*, translated into English in 1766, proposes, instead of trampling and beating the *hemp*, to give it a few days' steeping after it has been peeled or broken, in order to soften the bark, and the more ready to bring it to a proper degree of fineness. The *hemp* is for this purpose, to be divided into small parcels, and tied loosely with packthread, and thus laid in a vessel of water, where it is to remain for a longer or shorter time, according to the bairness of its fibres, and the quantity of glutinous matter adhering to it. Afterwards it should be washed clean in a running stream; and if many of the fibres of the *hemp* are found to cling together, he advises to beat it in the manner that linen is beaten in bleaching. After this beating, the parcels are opened, spread on a board, and laid in the sun to dry. The *hemp* may be again steeped and washed in a ley of potash, or wood ashes, which will soften the true reject of the flaxing. M. Mercander also used for this purpose a ley, prepared of horse-chestnuts peeled, and tamped into soft water, in the proportion of two or three parts to every quart of water. This ley may be used either before or after the wash with beer; and the *hemp*, after having been steeped and washed in it, is carefully dried, and then tied up in bundles. *Hemp* thus prepared, say the same author, may be dyed like silk, wool, or cotton; and made into various cloths and garments, which will be in no danger of being destroyed by tawse worms that eat woollen cloth. The *hemp* remains now to be *broken*, or pulled through divers toothed instruments, not unlike the wool-combs combs, of different fineness: this separating the shorter tow from it, the rest is fit to be spun, woven, sew, for thread, cordage, or the like.

Hierofach are used in medicine on many occasions; but they are suspected of being bad for the health. An emulsion made from them, by trituration in water, and decoctions of them in milk, are of great use in old coughs, and the jaundice. They have been formerly believed to occasion impotency; but that is not at all likely, for they not only cause heats to lay eggs in plenty, if given moderately, but the famous baugoe, so much used by the Persians and Indians to invigorate them, is a species of *hemp*. Miller.

Hieracium, latifolium, Drostka, in Batany, a genus of the *Festuca didyma* class. Its characters are these: there are male and female flowers in different plants; the male flowers have a five-leaved empaleament, but no petals, with ten stamens; the female flowers have no petals, but empaleaments like the male, with an oblong perisperm germin, supporting three styles, and an oblong triangular capsule with three valves, filled with small seeds, adhering to the three sides of the capsule. There are two females. Miller.

clump, water. See *Water-Hemp* Acanthoscy.

Вульф. 4 Мем. agrimontu. See *ЛОКАТИУМ*.

Chrysomelids, not *beetles*. See VERONICA.

HEN, in Ornithology. See *TYPE FOWL*, and *G*.

CAOUI.

Hen, Guinea. See GUINEA-*hen*.

HENBANE, *Hyoscyamus*, in Botany, a genus of the pre-

Andrena polymorpha clark. Its characters are: the flower has a cylindrical calyx of one leaf, which is permanent; it has one funnel-shaped petal, cut into five obtuse parts, with five inclined lamina; in the centre is situated a roundish germin, which becomes an obtuse capsule, divided into two cells by an intermediate partition, opening with a lid at the top, to let out many seeds which adhere to the partition. There are six species.

The roots of the common *hemp* are used for anodyne necklaces, to hang about children's necks, to prevent fits, and cause them to breed their teeth easily; but they are very dangerous to use inwardly. Miller.

There are two kinds of *umbellæ* used in medicine, which possess the same narcotic virtues, but in a different degree; the white is the milder of the two, and therefore generally prescribed. They are recommended in many cases, particularly in fortifying of blood, sharp

fluxions on the lungs, and likewise in some convulsive disorders. This medicine, however, is of suspicious quality, and appears at best to be only a precarious succedaneum to the products of the poppy.

Hemban has been always esteemed poisonous; and we have a late account of the manner of its affecting those who have taken it, from Tozey in France, which appears very singular. See Phil. Trans. N° 450. p. 449.

Hemban-fish, is used by many people in the tooth-ach, and in several other maladies, and is an ingredient in some of the official compositions, particularly in the phlegmon Romanum; but it has been found, when taken alone, to be poisonous. Sir Hans Sloane gives an account in the Philosophical Transactions, of some children who, eating the seeds of the common *hemban*, were affected with intense thirst, ravings, dimness of sight, and a profound sleep, which in one of them lasted two days. These were all recovered by bleeding, blistering, purging, and vomiting. What Sir Hans observes particularly of the case is, that the delirium which was occasioned by these seeds was not of the common kind, but was of the nature of that produced by the datura, a species of stramonium, and by the bauges of the East Indies, which is a plant with leaves like hemp. Phil. Trans. N° 430. The virtues of this seed may compensate for the mischief it may do when taken in any improper manner; in the tooth-ach nothing perhaps is equal to it. Sir Hans Sloane mentions an account of a quack who cured this pain immediately by burning these seeds, and causing the vapour to be received into the tooth through a funnel. The empiric daily continued to have fine small maggots conveyed at the same time into a pail of water placed under the patient's head, which he pretended to have fallen out of the tooth; by the virtues of the medicine; but these being bred up to their change, became small beetles, and were doubtless of the common kind.

HENBANK, *silva*. See TOBACCO.

HENBANK-HILL, in *Natural History*, a name given by some to a peculiar insect found very frequently on that plant in the summer months. It is one of the cimetes of authors, and is very well described by Lister in the Philosophical Transactions. It is a very large cimet, of a fine red, spotted with black. It feeds on the juices of the *hemban*, whole leaves and stalks it pierces with its trunk. It is very remarkable that the juices of this stinking plant become of a very agreeable and aromatic flavour in the body of this insect; and so that it may perhaps be found, that the mischievous narcotic quality of the plant may be rendered wholesome, and a good medicine, in the body of this insect. Phil. Trans. N° 71.

In June and July it is common to see several series of oblong orange-coloured bodies adhering to the upper sides of the leaves of this plant; these are the eggs of this cimet. These eggs are white in the belly of the insect, and whitish when laid first; but they grow more deep-coloured when the young one comes near the time of hatching. They are hatched into perfect cimetes, not into worms. These eggs yield a colour, which is so fine, that it may be worth introducing into use, in some manner; it is a fine lively carmine. There needs no more to obtain it, but the rubbing on crushing the eggs, while fresh, upon white paper. The insects themselves are so common, that from May to the end of June it is scarce possible to find a plant without them; and the eggs are not less frequent in their season, in hot weather. They are sometimes laid in May, but never later than June; their colour is apt to fade of itself; but this might probably be much assisted as to holding, by alum, or other additions.

HENDECAGON, compounded of *deka*, eleven, and *gonia*, angle, in *Geometry*, a figure which has eleven sides, and is many angles.

HENDECAGON, in *Fortification*, is used for a place defended by eleven bastions.

HENDECASYLLABUM, *ἑκατασύλλαβον*, compounded of *deka*, eleven, and *syllaba*, syllable, of *τετρασύλλαβον*, I comprehend, in Greek and Latin Poetry, a verse of eleven syllables. Sapphic and Phalæcic verses are, *hendecasyllabi*, or *hendecasyllabi*. E.g.

Sap. Jam satis terribilis visus atque dira.

Phal. Pajus mortuus est mea puella.

HENED-PENNY, in our *Old Writers*, a customary payment of money instead of *hen*, at Christmastide. It is mentioned in a charter of King Edward III. Mon. Angl. tom. ii. p. 327. Du-Cange is of opinion it may be *hen-penny*, *gallinarius*, or a composition for eggs; but Cowell thinks it is misprinted *head-penny* for *breed-penny*, or *head-penny*.

HEN-HARRIER, in *Ornithology*, the English name for the *falco cygnus* of Linnaeus, which has been supposed to be the male subbutto, the female of which is to very dif-

ferent, that it has been called by another name, the *KING-EAGLE*. But males have been lately discovered of this species.

The *hen-harrier* is smaller than the ring-tail; its head, neck, and back, are of a dove-colour; its shoulder-feathers, however, are somewhat brownish; its rump is somewhat whitish, and its breast of a fine clean white, variegated with transverse brown spots; its wings and tail are grey or dove-coloured, variegated with black, and its legs smaller and slenderer than is usual in the hawk-kind, and of a yellow colour. These birds, which fly near the surface of the ground in search of prey, and breed on the ground, without ever settling on trees, are extremely desired for in young poultry, and the feathered game. Ray and Pennant.

HEN-HOUSE, a place or building for confining, or sheltering poultry.

HENICOCOE, in *Botany*, a name given by the people of Guinea to a species of plant which we are unacquainted with, but which they give with very great success in all kinds of the colic, boiled in water. Phil. Trans. N° 222.

HENIOCHAS, *Ἡνιοχας*, in *Astronomy*, a northern constellation. See AURIGA.

HEN-MOULD, *sol*, in *Agriculture*, a term used by the husbandmen in Northamptonshire, and other counties, to express a black, hollow, spongy, and mouldering earth, usually found at the bottoms of hills.

It is an earth much fitter for grazing than for corn, because it will never settle close enough to the grain to keep it sufficiently steady while it is growing up, without which, the farmers observe, it either does not grow well, or, if it seem to thrive, as it will in some years, the growth is rank, and yields much straw, but little ear.

It is too moist, and to that it is principally to be attributed the rankness of the crop in some years, and the occasion of its remaining so much mottled in, that it usually has a bed of a thin clay, which will not let the water run off into the under strata.

In some places they also give this name to a black, rich, and dense earth, with streaks of a whitish mould in many parts. This sort of *hen-mould* is usually found very rich and fertile. Morison's Northampton, p. 37.

HENNA, in *Botany*, a name given by Ludwig to a genus of plants, called also by Dr. Shaw and others, and since named by LINNÆUS *LAWSONIA*.

HENOTHRIX, in *Natural History*, the name of a fly of the fericuda or hair-tailed kind. This is distinguished from the others by having only one hair, and is called also by some unites. The whole body of this species is black, except the middle of the back and belly, which are red; the wings are silvery; and the antennæ very small and black. It is very common in the warm climates, and is usually found sitting on the animal, or bishop's weed; whence it is called by some the animal fly.

HENOTICUM, *Ἡνωτικον*, a. d. *reconciliator*, of *two*, I unite, in *Church History*, a famous edict of the emperor Zenos, published A. D. 482, and intended to reconcile and reunite the Eusebians with the Catholics.

It was procured of the emperor by means of Acacius, patriarch of Constantinople, with the assistance of the friends of Peter Mongus and Peter Trullo.

The thing of this edict lies here; that it repeats and confirms all that had been enacted in the councils of Nice, Constantinople, Ephesus, and Chalcedon, against the Arians, Nestorians, and Eusebians, without making any particular mention of the council of Chalcedon. It is in form of a letter, addressed by Zenos to the bishops, priests, monks, and people of Egypt and Lybia. It was opposed by the Catholics, and condemned in form by pope Felix II.

HENRICIANS, in *Reformation History*, a sect so called from Henry its founder, who, though a monk and hermit, undertook to reform the superstitions and vices of the clergy; for this purpose he left Lausanne in Switzerland, and removing from different places, at length settled at Tholouse in the year 1147, and there exercised his ministerial function, till being overcome by the opposition of Bernard abbot of Clairvaux, and condemned by pope Eugenius III. at a council assembled at Rhims, he was committed to a close prison in 1148, where he soon ended his days. This reformer rejected the baptism of infants; severely censured the corrupt manners of the clergy; treating the ceremonies and festivals of the church with the utmost contempt, and held clandestine assemblies for inculcating his peculiar doctrines. Moeur's Eccl. Hist. vol. ii. p. 448. ed. 8vo. 1768. See PETROBRUSIANS.

HENRICUS, *valens*, in the affected language of some chemists, a name given to vitriol when calcined to a redness.

HENTINGS, in *Agriculture*, a term used by the farmers for a particular method of sowing before the plough; the corn

corn being cast into a straight line just where the plough is to come, is by this means perfectly ploughed in. By this way of sowing they think they have a great deal of feed and other charge, a dextrous boy being as capable of sowing this way out of his hat, as the most skillful seedsman. *Ploer's Hill, of Oxfordshire, p. 251.*

HENTINO is also a term used by the plowmen, and others, to signify the two furrows that are turned from one another at the bottom, in the ploughing of a ridge. The word seems to be a corruption of *enting*, because those furrows make an end of ploughing the ridges. The tops of the ridges they call *veerings*.

HENWEDD, *Gnarus, Patersoni*, in *Batey*, a genus of the *hesperis tetragyna* class. Its characters are these: the flower has a permanent calyx; it hath four small white petals, placed in form of a cross, which soon fall off; and six well-placed erect stamens, terminated by single summits; in the centre is situated an oblong compressed germ, with four well-shaped styles; the petiole afterwards becomes one oblong leaf, narrow at the bottom, and taper, but broad, and flattened at the top, resembling an inverted shield, armed with the acute styles, which is reflexed.

We know but one species of this plant, which is a very common plant in Jamaica, Barbadoes, and most of the other islands in the West Indies, where it grows in such plenty as to become a very troublesome weed. In Europe this plant is preferred in the gardens of those persons who are curious in botany; but there is little beauty in it, and having a strong rank scent upon being handled, it is less valuable. *Milner.*

HERBIPPENY, in our *Old Writers*, the same with what at first was called *Ranunculus*, and afterwards *PATERSCUS*.

The word is Saxon, from *herb*, *herb*, a herb, and *penning*, denoting, a penny.

HEPAR, in *Anatomy*. See **LIVER**.

HEPAR, in *Chemistry*. See **LIVER**.

HEPAR stramonii, the same with **PLACENTA**.

HEPATIC, in *Medicine and Anatomy*, something that relates to the liver; by the Greeks called *hepar*, *hepar*.

HEPATIC stone. See **ALLOES**.

HEPATIC duct, is a vessel more usually called *pancreatic duct*.

HEPATIC flux, *fluxus hepaticus*, a flux of the belly of a very singular kind, and so rarely met with, that many authors have confounded the accounts of it with those of dysenteries and hemorrhoidal fluxes. The signs by which it is known, are these: the patient voids by the anus a liquid matter, resembling water in which raw flesh had been washed; this is attended with pains and a sense of weight and tension in the abdomen, and spastic motions about the loins, which sometimes extend themselves to the right-side toward the region of the liver. In some patients there is no sensation of any pain, or any particular frumpon, and in some a tenesmus is joined continually with this voiding of a bloody flux.

The persons principally subject to this disease are men, and those between the age of eighteen and forty for the most part, as also such as are of a sanguine-phlegmatic habit, and of a sedentary life. This disease is obviously distinguished from a dysentery, in that there is always in that disease blood mixed with a mucous matter voided, which is not at all the case in this; and in that there is always more or less of a fever attending, whereas in this there is none.

Causa of it. The ancients supposed this to be owing to a debility in the liver, which was not able in this case properly to attract or retain the blood. But it seems rather to belong to the hemorrhoidal discharges; and as in the menes, when the pure and proper blood is not discharged, a bloody water is; so in these cases when true blood is not voided, this fluid comes in its place. This flux is never dangerous at the time; but when it is long continued it will at length wear down the strength, and bring on bad habits.

Method of cure. This is to be treated in the same manner as a hemorrhoidal discharge when obstructed, and antispasmodic and astringent medicines are to be given, with gentle purges. Rhubarb, in doses from a scruple to two or more, is to be given every day for a long time; after this nitre, tartarum vitriolatum, the alkaline salts of plants, ivy of wormwood, with the absorbent powders, such as crabs eyes; and to these may be added decoctions of small caryony, and dist-like herbs. *Juncker's Comp. Med. p. 50.*

HEPATIC pleura. See **PLEURA hepatica**.

HEPATIC vein, is that otherwise called **HEMICA**.

HEPATIC cystic duct. See **CYSTIC duct**.

HEPATICA, in *Anatomy*. See **LIVER** vein.

HEPATIS infectus, in *Medicine*, the name of a disease, consisting in a flagrant congestion of the blood in the

liver. This is of two kinds, the one owing to an indurate contraction of the liver, which is usually the case when this happens to adults; the other is owing to a too great expansion of this viscum, which is the case more frequently in youth. Either of these disempowers of this organ prevents the free passage of the blood through it, and by this means lays the basis of this infection.

Signs of it. These are a flatness of the pericostia, especially about the right hypochondrium, and a difficulty of breathing, a heavy and obscure pain in the same part, which sometimes becomes pulsative, an uncertain and irregular heat of the whole body, and frequent flushings of the face; a violent thirst at times, but not continual, a dryness of the mouth, and often a bitter taste in it; a glutinous texture of the spittle; a dry cough, a loss of appetite, and lassitude of the limbs; uneasiness, and not sound sleep, frequent tossing about while in bed; a faccid habit of body; and to all these it is to be added, that the urine is thin and limpid at first; but as the hectic, that always attends it, increases, it becomes of a deep orange colour, and finally deposits a deep red sediment; and in case of an expansion of the liver being the cause, the right hypochondrium is sensibly swelled.

Persons subject to this disorder, are principally such as are of a robust and sedentary, or idle life; such as have omitted usual bleedings, or have had suppressions of the natural discharges by the hemorrhoids or menses, and such as use too thick a diet.

Causa of it. These are a plethora, joined with a too great thickness of the blood, and this occasionally increased by improper treatment in different diseases, as in intermittents, with too powerful astringents; and in acute fevers with too cooling a regimen or the abuse of the volatile salts in large doses. To these may be added violent passions of the mind; and the sudden chilling the body when very hot.

Prognosis. This is a disease that when recent admits of a cure under the proper methods of treatment; but when neglected, it very easily degenerates into a leishus, and finally into a hectic and a dropsy.

Method of cure. This differs greatly in regard to the different causes of the disease, which, as before observed, are exact contraries; it sometimes arises from an over-contraction, sometimes from an over-expansion of the liver. In cases arising from the expansion, the same method is to be used as in infections of the SPLEEN. But on the contrary, when it arises from a contraction of this viscum, the method must be this: the prime via must be first cleaned and evacuated by gentle purges; after this bleeding in the foot is to be ordered, and then the matter impacted in the liver is to be incised and attenuated by decoctions of daucus and pimpinell roots, with maiden-hair, sorrel, dodder, and daisy-flowers; after this the gums, as ammoniacum, and the resin are to be taken; and after these the digestive salts, as tartarum vitriolatum, nitre, and the like, and during the use of these, all the external medicines of the emollient kind are to be applied to the right hypochondrium; but this not continually, but at different intervals, lest they should bring on a suppuration in the liver. *Juncker's Comp. Med. p. 204. &c.*

HEPATITIS, in *Medicine*, the name of an acute, continuous, and inflammatory fever, in which nature frequently and forcibly propels the humours through the liver, seemingly with intent to resolve and dissolve congestions and flatus of the blood in that viscum.

The *hepatitis* is distinguished from all other fevers by the seat of it in the liver, and by its being of all fevers the most fatal. It differs however in degree, some cases depending on a more superficial, some on a deeper and more internal inflammation of the liver.

Signs of it. This dangerous fever usually seizes the patient with a chilliness, which lasts a considerable time; this is at length succeeded by a violent heat, which is much more intense sometimes than at others, and is attended with an insupportable thirst. The patient perceives a severe and heavy pain on the right side about the seventh or eighth rib, and is afflicted with a violent flatness of the breast, and difficulty of breathing, and the extremities are very apt to become cold. After drinking any thing they usually belch, and the narrowness of the breast and difficulty of breathing always increase upon this, though not the pain. Often also there are nausea andretching in vomit, and a viscid matter is thrown up, and sometimes spastic motions of the throat are very frequent and painful. The one or the other of these symptoms occur, as the yellow bile or the other part of the liver are affected. The cough attending this disease is dry, and not violent, and the sweats are continual, but moderate, and easily struck back, or often cold and clammy. The urine for the first days is reddish and thick, and about the fourth day it usually begins to deposit a sediment,

HEPTAGONAL numbers, are a sort of polygonal numbers, wherein the difference of the terms of the corresponding arithmetical progression is five.

One property, among others, of these numbers, is, that if they be multiplied by 40, and 9 be added to the product, the sum is always a square NUMBER.

HEPTAMERIS, literally signifies a *seventh part*; being formed of the Greek *hepta*, seven, and *meros*, part, or portion.

The word is used by M. Saurer, in his Principles of Acoustics, for the seventh part of a MERIS; and, in his System, for the forty-third part of the octave.

HEPTAMERON, a term literally implying *seven days*; being compounded of *hepta*, seven, and *meros*, day.

It is chiefly used as a title of certain books, containing the transactions of seven days.

The *Heptameron* of Margarete de Valois, sister to Francis I. of France, and queen of Navarre, is a very ingenious piece, in the manner of Boccaccio's Decamerone.

HEPTANDRIA, in Botany, the seventh class of plants with hermaphrodite flowers, and seven male parts or stamina in each.

The word is formed of the Greek *hepta*, seven, and *andria*, male.

This class comprehends four orders, viz. *monogynia*, which includes three genera, viz. horse-chestnut, trientalis, and disandra; *gynia*, having one genus, viz. *linum*; *tetragynia*, including one genus, viz. *aurantia*; and *heptagynia*, of which there is also one genus, viz. *lupinus*. See Tab. I. Botany, Heptandria, and Tab. IV. Botany, Class VII. See FRUCTIFICATION.

HEPTANGULAR figure, in Geometry, a figure with seven angles, or seven sides.

HEPTAPHARMACUM, a relaxing, suppurating, and incarnating medicine, compounded of seven ingredients. This is much talked of among the ancient writers in medicine. The ingredients were, ceras, was, pitch, litharge, colophony, bull's fat, and frankincense. It is described by Aetius in his Tetrab. ferm. 3. cap. 27.

HEPTAPLEURON, *Septimervus*, having seven ribs; a word used in botany to express a sort of common plantain, every leaf of which has seven ribs belonging to it.

HEPTARCHY, compounded of the Greek *hepta*, seven, and *arche*, imperium, government, a government composed of seven persons, or a country governed by seven persons, or divided into seven kingdoms.

The Saxon *heptarchy* included all England, which was cantoned out into seven petty independent kingdoms, peopled and governed by different clans and colonies; viz. those of Kent, the South Saxons, West Saxons, East Saxons, Northumberland, the East Angles, and Mercia. The *heptarchy* was formed by degrees, from the year 445, when first the kingdom of Kent was created, and Hengist assumed the title of king of Kent immediately after the battle of Eglesford; and it terminated in 827, or 828, when king Egbert reunited them into one, made the *heptarchy* into a MONARCHY, and assumed the title of king of England. It must be observed, however, that though Egbert became monarch of England, he was not perfectly absolute. The kingdom which he actually possessed consisted of the ancient kingdoms of Wessex, Suffex, Kent, and Essex, that had been peopled by Saxons and Jutes. As for the other three kingdoms, whose inhabitants were Angles, he contented himself with preserving the sovereignty over them, permitting them to be governed by kings, who were his vassals and tributaries.

The government of the *heptarchy*, reckoning from the founding of the kingdom of Mercia, the last of the seven Anglo-Saxon kingdoms, lasted two hundred and forty-three years; but if the time spent by the Saxons in their conquests from the arrival of Hengist in 445 be added, the *heptarchy* will be found to have lasted three hundred and seventy-eight years, from its commencement to its dissolution. The causes of the dissolution of the *heptarchy* were the great inequality among the seven kingdoms, three of which greatly surpassed the others in extent and power; the default of male heirs in the royal families of all the kingdoms, that of Wessex excepted; and the concurrence of various circumstances which combined in the time of Egbert.

HEPTATEUCH, in *Masters of Literature*, a volume, or work, consisting of seven books.

The word is compounded of *hepta*, seven, and *teucha*, 1. *work*; whence *teucha*, a work, book; and *hepta*, seven, *heptateuch*, a work of seven parts or seven different works joined in one volume.

Heptateuch is chiefly applied to the first seven books of the Old Testament; viz. Genesis, Exodus, Leviticus, Numbers, Deuteronomy, Joshua, and Judges; that is, the five books of Moses called the *Pentateuch*, and the two following ones, which are usually joined therewith.

HERACANTHA, in Botany, a term used by some authors to express the common wild carline-thistle. See CAR-LINA.

HERACLEON, in Botany, a name given by some of the Greek writers to the lithoperum, or ground-swallow. It was originally called the *heracleon spinosus*, *spinosa artem*, the *heracleon-jedi*, from the remarkable hardness of the seed; but the latter word was dropped, and the *heracleon* only preserved. There is great reason against using the word *dispyros* as a synonym for the groundswallow, because it is a name given by some of the Greeks to a very different kind of vegetable, a sort of cherry. Pliny, lib. xvi. cap. 11.

HERACLEONITES, ancient heretics of the sect of the Gnostics, thus called from their leader, Heracleon.

St. Epiphanius, Har. 36. is very ample on this heresy. He represents Heracleon as one who had reformed the theology of the Gnostics in many points; though, at bottom, he had retained the principal articles thereof. He refined on the ordinary interpretations of abundance of texts of Scripture; and even altered the words of some, to make them consist with his own notions.

He distinguished two kinds of worlds, the one divine, the other corruptible; and restrained the word *maria*, all things, to this last. He held, that the Word did not create the world immediately, and of himself; but only that he gave occasion to the demigods to do it.

The *Heracleonites*, after the example of their master, annulled all the ancient prophecies, holding that St. John was really the voice that proclaimed and pointed out the Messiah; but that the prophecies were only empty fables, and signified nothing. They held themselves superior, in point of knowledge, to the apostles; and, on that footing, dared to advance the most extravagant paradoxes, on pretence of explaining Scripture in a sublime, elevated manner. They were so fond of these mystic interpretations, that Origen, though a sinner that way himself, was obliged to reproach Heracleon with his abusing Scripture by that means.

HERACLEUM, in Botany. See CUSCUTARIA.

HERACLEUS lapsi, in the *Natural History of the Animals*, a name by which many have called the loadstone. This was the name given to it by the ancient Greeks from Heracles, a city of Lydia, near which it used to be found; but subsequent writers to far erred from the origin and orthography of the word, as to call it *herculeus lapsi*, as if it had been named from Hercules.

The after-ages of the Greeks called it also *magnetus lapsi*, but this was a name by no means applied to it in the earlier times, but then was used to express a very different substance, a white silvery looking stone, which had no power of attraction, but was turned into beautiful vessels for the use of the table; and the not attending to the ages in which the authors lived who use the word *magneti*, has been the occasion of great errors in their commentaries, who did not consider that in the succession of a few ages, the same word became the name of two very different things. Hill's Theophr. p. 79. See BASALTES.

HERACLIA, *Ἡρακλῆα*, in Antiquity, an Athenian festival celebrated every fifth year in honour of Hercules.

The Thibians and Thebans in Arcadia observed a solemn festival in honour of Hercules, farmed *heros*, because apples were offered to him. Besides these there were other festivals kept in honour of Hercules; for a description of all which, see Potter's Antiquar. Græc. lib. ii. cap. 20. tom. i. p. 398, seq.

HERACLIDÆ, in Antiquity, the descendants of Hercules, whom the Greeks called *Heracleæ*, from *heros*, hero, *heros*, and *heros*, glory, on account of the glory he acquired by executing what Juno induced him to undertake.

The *Heracleidæ* were expelled from Peloponnesus by Euristheus, king of Mycenæ, after the death of Hercules.

HERACLIDÆ, return of the, into Peloponnesus, is a celebrated epocha in the ancient chronology.

The time of this return is differently assigned; because authors mistake the divers attempts which they made to return, for the return itself. The first attempt was twenty years before the taking of Troy; the second was a hundred years later, or eighty years after the taking of Troy. This last is supposed to have succeeded; at least, according to Ptolemy, who mentions only these two. Rat. Temp. p. 1. lib. i. cap. 12. and Decl. lib. ix. cap. 30. Scaliger distinguishes three attempts; and five, the first fifty years later than Ptolemy's; viz. thirty years after the taking of Troy. He says nothing of the second, which was unfortunate, like the first; but he places the third in the same year with Ptolemy's.

As it occasioned many changes and revolutions in the affairs of Greece, inasmuch that scarce a state, or people, but were turned upside down thereby, the return of the *Heracleidæ* is the epocha of the beginning of profane history.

tory, all the time that preceded it is reputed fabulous. Accordingly, Ephorus, Cumanius, Callisthenes, and Theopompus, only begin their histories from hence. See *Newman's Principles of Chronology*.

HERACLITISM, in *Antiquity*, denotes the philosophy of *Heraclitus*, who was born at Ephesus, and flourished about the sixty-ninth Olympiad. This philosopher differing from the vulgar concerning the nature of the gods and of the universe, was slighted and persecuted by his countrymen, and betook himself to a private life, and living in the mountains, subsisted on grass and herbs. His writings were comprised in a treatise, which, according to *Laertius*, contained a continued discourse on nature, and was divided into three books; one concerning the universe; the second, concerning politics; and the third, of theology. This book he deposited in the temple of *Diana*; and it is said, that he affected to write obscurely, lest it should be read by the vulgar, and become contemptible. The fundamental doctrine of his philosophy was, that fire is the principle of all things; and the ancient philosophers have collected and preserved admirable apophthegms of this philosopher.

HERÆA, *Hææa*, a festival celebrated at Argos in the honour of Juno, called in Greek *Ἡραία*. See a description of the ceremonies attending this solemnity, in *Potter's Archæol. Græc.* lib. ii. cap. 20. tom. i. p. 397.

There was another festival of this name, celebrated every fifth year in Elis, where sixteen matrons were appointed to weave a garment for the goddess.

There were other solemnities of this nature. See *Potter*, loc. cit. seq.

HERALD, an officer of arms, anciently in great repute, and possessed of several considerable functions, rights, and privileges.

The word *herald*, according to *Du-Cange*, comes from the Saxon *here*, or German *herr*, army, and *aid*, servant; because chiefly serving in the army. Others will have the two words signify *champion of the arms*; in allusion to their office of denouncing war, proclaiming peace, &c. *Du-Cange* adds, that they were called *clavigarii*, as well as *heraldi*. *Borel* derives the word from the Latin *heras*, master; q. d. one coming from his master; others from *herbau*; q. d. *high lord*; others from *herald*, which is the same with *dominus ostentans*; and others, lastly, from *her*, master, or army; and *bold*, q. d. *bold to his lord*, or the army.

The origin of *herald* is very ancient. *Stentor* is represented, by *Homer*, as *herald of the Greeks*, who had a voice louder than fifty men together. The Greeks called them *megaron*, and *epimechaneis*; and the Romans, *scudarii*.

The Romans had a college of *heraldi*, appointed to decide whether a war was just or unjust; and to prevent its coming to open hostilities, till all means had been attempted for deciding the difference in a pacific way.

Heraldi, or *heraldi at arms*, have formerly been denominated *duci at arms*, because properly belonging to dukes; as kings at arms, to kings.

In England we have six *heraldi*; viz. 1. *Richmond*; 2. *Lancaster*; 3. *Cheshire*; 4. *Windsor*; 5. *Somerlet*; 6. *York*. To which may be added three *heraldi* extraordinary; viz. *Arundel*, *Norfolk*, and *Mowbray*. Their office is, to wait at court, to order and attend public solemnities, as coronations, installations, &c. to proclaim war and peace, to look to the regulation of the bearings of arms, and to search pedigrees, &c. under the authority of the earl marshal and his deputy.

They were formerly created and christened by the king, who, slowly pouring a gold cup of wine on their head, gave them their *herald's* name: now it is done by the earl marshal. They could not arrive at the dignity of *herald*, without having been seven years *pourcuivant*; nor could they quit the function of *herald*, but to be made *king at arms*.

Their principal employment was, to compose, or make out, coats of arms, genealogies, and titles, of the nobility. They were the superintendents of military exploits, and the conservators of the honours of war. They had a right to take away the arms of such as, for cowardice, treason, &c. deserved to be degraded. They had a commission to examine and correct the vices and disorders of the nobles, and, on such occasions, to exclude them from jousts, tournaments, &c. to them belonged also the correcting of all usurpations and abuses relating to crowns, coronets, caiks, crests, supporters, &c. They took cognizance of all differences among the nobles, with respect to their bearings, the antiquity of their families, precedencies, &c. They went into the several countries to search into the grounds and pretensions of nobility; and had a right to open all libraries, and to command all the ancient charters and instruments in the

archives to be shewn them; they had admission into all foreign courts, where they were commissioned to proclaim war and peace; and their persons were held sacred as those of ambassadors. To them it belonged to make publication of jousts and tournaments; to call the people to them; to signify the cartel; to mark the ground, list, or place of duel; to see fair play observed; and to divide the fun between the two parties. In the army, they advertised the cavaliers and captains of the day of battle, and assisted therein before the standard; retiring, after the first onset, to some place of eminence, there to observe who behaved best, and to give a faithful report thereof to the king. They also numbered the dead, relieved the enliven, re-demanded prisoners, summoned places to surrender, and in capitulations walked before the governor of the place, to receive and warrant his person. They were the principal arbiters of the distribution of the spoils of the vanquished, and of military rewards. They published victories, and gave notifications thereof to foreign courts. They conveyed the estates of the kingdom, allied at royal marriages, and frequently made the first demand; they also officiated at solemn feasts, &c.

The modern *heraldi*, i. e. those we properly call *heraldi*, have lost a good deal of the distinction and office of the ancient ones. What relates to the making out arms, the rectifying of abuses therein, &c. is chiefly committed to the kings at arms. And in the army, drums and trumpets have succeeded to the functions of *heraldi*, being sent by the generals on the same errands; and on that account enjoying the same rights and privileges. Their persons are under the protection of the law of nations, when they bear the marks of their offices publicly, i. e. the trumpeter his trumpet, and the drummer his drum; in the same manner as the *herald's* his coat.

The *heraldi*, with the kings at arms, and the four *pourcuivants*, are a *colledge*, or corporation; erected into such by charter of Richard III. who granted them divers privileges, as to be free from subsidies, tolls, and all troublesome offices. *Clarendon* and *Norroy* king at arms are also called *provincial heralds*.

HERALDRY, the art of armoury and blazoning, or the knowledge of what relates to the bearing of arms, and the laws and regulations thereof. See *ARMS*, *BLAZONING*, &c.

It is an established rule among the *heraldi*, that in blazoning, animals are always to be interpreted in the best sense; that is, according to their most noble and generous qualities, and so as may redound most to the honour of the bearers.

Thus the fox, being reputed witty, and withal given to filching for his prey; if this be the charge of an escutcheon, we are to conceive the quality represented to be his wit and cunning, not his theft.

Gullim adds, that all savage beasts are to be figured in their fiercest action; as, a lion crested, his mouth wide open, his claws extended, &c. thus formed, he is said to be *rampant*. A leopard or wolf is to be portrayed going, as it were, *postecotim*; which form of action, faith *Chaffaucus*, fits their natural disposition, and is termed *passant*. The gentler kinds are to be set forth in their noblest and most advantageous action; as, a horse running or vaulting, a grey-hound couling, a deer tripping, a lamb going with smooth and easy pace, &c. Every animal is to be moving or looking to the right side of the shield; and it is a general rule, that the right foot be placed foremost, because the right side is reckoned the beginning of motion; add, that the upper part is nobler than the lower; so that things constrained either to look up or down, ought rather to be designed looking upwards. It must be noted, that notwithstanding these solemn precepts of *Gullim*, and the other masters of armoury, we find by experience, that there are lions passant, couchant, and dormant, as well as rampant, and that most animals in arms look down, and not up.

Birds are esteemed a more honourable bearing than fish; and wild and ravenous birds than tame ones.

Birds, according to *Leigh*, are to be numbered as far as ten; according to *Chaffaucus*, to sixteen; after which they are to be blazoned without number. When their bills and feet are of a different colour from the rest, they are said to be *membered*.

Birds of prey are more properly said to be *armed*.

Birds borne of their natural colour are to be blazoned by *proper*, without mention of the colour. In the blazoning of fowls much exercised in flight, if the wings be not displayed, they are said to be borne *close*; e. g. he beareth an eagle, a hawk, or a swallow, *close*. In the general, wherever a bird is found in any action or posture, to which nature does not ordinarily incline it, such action or posture is to be named, otherwise not. *Coats, Her. Dict.* p. 53.

Fish are of themselves of less esteem in a coat of arms than beasts and fowls, as being posterior thereto in the order of creation; but they sometimes become so dignified by the persons or families who bear them, as to be preferable to many birds and beasts.

Fish are borne different ways; upright, embowed, extended, enfolded, surmounted of each other, fretted, triangled, &c.

All *Fish* borne feeding should be termed *devouring*.

Those borne directly upright should be termed *MAURICANT*.

And those borne traverse the escutcheon, *naissant*.

Heraldry like wife comprehends what relates to the marshalling of solemn cavalcades, processions, and other ceremonies at coronations, installments, creations of peers, funerals, nuptials, &c.

HERB, a name common to all plants whose stalks or stems die away every year, after their seed is become ripe.

The word is formed of the Latin *herba*, which some derive from *herum*, *feld*; others from the Greek *phipon*, *phosion*, *feld*, of *phos*, *palatum*. Of the Greek *phosion*, the Latins formed *herba*; and of *phosion*, *herba*, after the manner of the Spaniards, who always change the *s* at the beginning of a word into *h*.

There are some *herbs* whose root perishes with the stem; and others, where the root survives the stem by several years.

Of the former, those which come to maturity the first year, and after they have cast their seed die away, are called *annuals*: such are wheat, rye, &c.

Those which only bear flowers and fruit the second year, or even the third year, and then perish, are called *biennial* and *triennial*: such are the garden angelica, and some others.

Herbs whose root does not perish after they have shed their seeds, are called *perennials*: such are mint, &c.

Of these, some keep their leaves all the year round, and are called *perpetuus*, as the asparagus, &c. See *EVERGREEN*.

The rest lose their leaves, and continue bare part of the year; as colts-foot, &c.

Herbs are also distinguished into *kitchen* or *field-herbs*, and *medicinal herbs*.

HERBS, *sals*, See *SALLER*.

HERBS, *medicinal*, See *MEDICAL*.

HERBS, *low*, in *Botany*. See *Broom RAPE*.

HERBS, *low*, *great purple*. See *LAVANNA*.

HERBS, *St. Bartholomew's*. See *HOLLY*.

HERBA *binet*, *herb blanch*, or *avena*, *grain*, in *Botany*, a genus of the *tribus* *polytricha* class. Its characters are these: the flower has five roundish petals, which are narrow at their base, where they are inserted in the empanement, and a great number of oval-shaped stamens, which are of the length of the empanement, into which they are inserted; in the centre of the flower is situated a great number of germins collected into a head, which become so many flat hairy seeds, with the style, which is bent like a knee, adhering to them. Miller enumerates 15 species.

The common sort grows plentifully by the sides of hedges and in woods, in most parts of England, so is rarely admitted into gardens. This stands in the list of medicinal plants; the root is the part used, and is esteemed cephalic and alexipharmic. It is manifestly of a binding nature, and so is useful in all fluxes, &c.

HERBA *Christophori*, *altiss*, in *Botany*, a genus of the *polytricha* *marginata* class. Its characters are these: the empanement of the flower is composed of four roundish concave leaves, which fall off; the flower has four petals which drop off, a great number of stamens, and an oval germin with one stigma, which becomes a smooth oval berry, including several roundish seeds. There are three species. Miller.

In the opinion of all botanists this is a very poisonous plant; but Pliny says, it may be given in the quantity of an acerbulation, that is, half a quarter of a pint, in internal disorders of women; which seems to argue some mistake. James.

HERB *Gierich*, in *Botany*, a name sometimes given to a distinct genus of plants, otherwise called *ANGELICA*; but more commonly to the wild angelica, called also *scaberrima*.

HERB of *grain*, a name by which some call *ABA*.

HERB *medicinal*. See *SAVORY*.

HERB *Paris*. See *PARIS*.

HERB *Robert*, a name sometimes used for the *ORNUBUM*, or *cornel* *bell*.

HERB *rosifolia*, in *Botany*. See *THORNT*.

HERB *virgin*, in *Botany*, a name sometimes given to the *HYSSOP*.

HERB *crucifera*, the name by which the *herb* *PARIS* is sometimes called.

HERB *suav-pensa*, the name of a distinct genus of plants, called otherwise *HYSSOPUS* or *monarda*. See *LOOSE-STRIKE*.

HERB *willow*, or *willow-herb*, a name sometimes given to two or three distinct genera of plants. See *LOOSE-STRIKE*, *Purple LOOSE-STRIKE*, and *Herb* *Willow*.

HERBA *lach*, in *Botany*, a name by which some authors have called the *chelonium majus*, or *great* *CELADINE*.

HERBA *refla*, in *Botany*, a name given by Latin writers to a plant used by the dyers in making their yellow colours, and by the women in tinging their hair yellow, which was the favourite colour of ancient times. It is also by some called *rubra herba*. It was from this similitude with the word *rubia*, which signifies madder, a vegetable used also in the dying trade, supposed to be the same plant; but all the accounts we have of the *rubia*, or *refla herba*, shew it to be different in all respects from the madder. Paulus Aegineta, who calls it *rubra herba*, takes pains to distinguish it from the *rubia*, and shews that it was the plant called *ecumenium* and *evancine* by the Greeks, and *lutum*, *lorea herba*, and *corniola* by the Latins. It is the *genista tinctoria*, or *DYEING* *WEE*, at this time common both in England and Greece, and used in both places in dying yellow. Pliny tells us, that the *lutum* had the leaves of flax, and the flowers of broom: this sufficiently shews that it was the plant we have mentioned.

HERBA *Schoua*, in *Botany*, a name by which some authors have called the common *LIQORICE*, the root and inspissated juice of which are used in the shops.

HERBA *Pakani*, in *Botany*, a name used by some writers for the *MANUCULUS*.

HERBAGE, a collective name, comprehending all kinds of herbs.

What makes the principal difference in the goodness of butter and cheese, is the difference of *herbage*.

HERBAGE, in *Laws*, signifies the green pasture or fruits of the earth, provided by nature for the food of cattle.

HERBAGE is also used for a liberty which a man hath to feed his cattle in another man's ground; as, in the forest.

HERBAL, a book which treats of plants, or describes the figure, genus, species, properties, virtues, &c. of herbs, trees, weeds, plants, &c.

Such are Gerard's *Herbal*, Parkinson's *Herbal*, &c.

HERBAL is also used for a set or collection of specimens of the several kinds of plants, dried and preserved in the leaves of a book, called also a *HERBARIUM*.

In the Philosophical Transactions, we have a method described for preserving specimens for such a *herbal*. The flowers, leaves, &c. gathered perfectly ripe, and in their true colours, are to be spread on white-brown paper, with the parts all displayed as distinctly as may be. If the stem, or body of the flower, &c. be thick, one half is to be pared away to make it lie flat. Over there is to be spread another paper; and the whole is to be put between two iron plates, forced tight together, and thus baked in an oven for two hours. When taken out, wash the plants over with a mixture of brandy and aqua fortis, and lay them on fresh paper to dry. Lastly, stick over the back sides with a brush dipped in a dissolution of gum tragacanth, to make them stick; and lay them in the paper book, where they will lie fast, and always look fresh.

HERBALIST, or **HERBORIST**, a person skillful in plants; the same with *botanist*.

To *herbarize* or *herborize*, is to go into the fields in search of different or new herbs or plants.

HERBE, in the French Academies, a reward, or some good stuff given to a horse that has worked well in the manege.

HERBINGER, or **HARRINGER**. See **HARRINGER**.

HERBER, in the *Manege*, is used by *farriers* to denote an application for some disease in horses, particularly of the head and nostrils. It consists only of a piece of heliobore-root, which, being put into the middle of the horse's nostrils, makes it swell and suppurate.

HERBIDA *velia*, green habits. See **EARINE** *vestis*.

HERBIVOROUS, an epithet given to those creatures which feed only on vegetables, to distinguish them from the carnivorous, or such as feed on flesh.

HERBOSUM *marma*, the name of a species of marble, much esteemed and used by the ancient architects and statuaries. It was of a beautiful green colour, but had always with it some cast of yellow. It was dug in the quarries of Taurum, but was esteemed by the workmen the same in all respects, except colour, with the black marble dug at Taurum in Laconia, and thence called the *Tenarian* marble.

HEICINIAN *herb*, in *Geography*, a forest which formerly extended over the Lake of Germany; Cnir reported it to be nine days journey in length, and six in breadth. It is now cut down in many places, and parcelled out into woods which go by particular names; as the Black forest, which separates Alsace from Swabia; the Steyer, in

in Franconia; the Spilland, on the Main; the Thüringer, in Thuringia; Heferswald, in the duchy of Cleves; the Bohemerswald, which encompasses Bohemia, and was in the middle ages called Hercynia sylva; and the Harz, in Lüneburg.

HERCULANEUM is the name of an ancient city of Campania, in Italy, which was destroyed by an eruption of Vesuvius in the first year of the empire of Titus, or the 79th of the Christian era, and lately rendered famous on account of the curious monuments of antiquity discovered in its ruins; an account of which has been published by order of the king of Naples, in a work of six volumes folio.

The epocha of the foundation of *Herculaneum* is unknown; Dionysius Halicarnassensis conjectures, that it may be referred to sixty years before the war of Troy, or about 1342 years before Christ, and therefore that it lasted about 1450 years.

HERCULANIA, in *Etymology*, a name by which some authors have called the verbena of VERVAIN.

HERCULES, *Erymanthos*, in *Astronomy*, one of the constellations of the northern hemisphere.

The stars in the constellation *Hercules*, in Ptolemy's catalogue, are 20; in Tycho's, 28; in the Britannic catalogue, 213. The longitudes, latitudes, magnitudes, &c. whereof are as follow:

Names and situations of the stars.	Sign.	Longit.	Latitude.	Magnitudes.
In the right leg	♈	3 49 10 15 30 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
South, of the 1 under right knee	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the bend of the right arm	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
10.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
North, of the 2 under right knee	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
15.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the right arm	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
20.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the right knee	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
25.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the armpit of the right shoulder	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
30.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
35.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
Northers in the right thigh	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
40.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the right side	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
45.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the top of right thigh	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
50.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
55.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6

Names and situations of the stars.	Sign.	Longit.	Latitude.	Magnitudes.
In the left side	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
North of the tail in the left thigh	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
60.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the top of the left thigh	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the head	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the left shoulder	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
65.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
70.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
75.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the left arm	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the left foot	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
80.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the armer, part of the left thigh	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
85.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the bend of the left arm	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the left foot	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
90.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the left knee	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
In the left wrist	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
3d of Hevelius's Cerberus	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
11 of ditto	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
4th of ditto	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
100.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
105.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
3d of Cerberus	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6
110.	♈	3 53 36 91 5 21 6	3 53 36 91 5 21 6	3 53 36 91 5 21 6

HERCULES, in *Mythology*, a celebrated hero of antiquity, who, on account of his singular exploits, was deified by the Pagans. He is said to have been the son of Jupiter and Alcmena, the wife of Amphitruon, king of Thebes. Herodotus fixes his birth a hundred years before the taking of Troy by the Greeks, or about the year 1382 before the commencement of the Christian era. The adventures for which he was celebrated may be distributed into three classes: to the first class we may refer his strangling the two serpents which were sent to destroy him in his cradle, and his killing a large lion near his native city Thebes. The second class comprehends those exploits which have been commonly called his twelve labours: these he undertook by order of Eurystheus, in consequence of the fatality of his birth, and of a decree of the Delphian oracle, as some say, for expiating his crime of killing the three children which he had by his wife Megara, the daughter of Creon; and in order to acquire immortality: the first of these was his engagement with the Cretan lion; the second, his conquest of the hydra; the third, his destruction of the Erymanthian boar; the fourth, his killing of the wild stag; the fifth, his shooting the flying birds called symphalides; the

The sixth, his cleansing Augeas's stables; the seventh and eighth, his destroying the bull, and Diomed, the barbarous tyrant of Thrace, with his horses; the ninth labour is his combat with Geryon, who is generally represented with three bodies; the tenth, his conquest of the Amazon; the eleventh, his dragging Cerberus up from the infernal regions; and the last is his killing the serpent, and gaining the golden fruit in the gardens of the Hesperides. The third class of *Hercules's* exploits were those which he voluntarily undertook; the chief of which are his combat with the giant Antæus, whereby he freed Africa from this destroyer, and his killing Cacus, the notorious robber of Italy. These several adventures are represented and described both by the ancient statuary and poets.

It is observed, that there are none, even of the twelve great gods of antiquity, that have so many ancient monuments relating to them as *Hercules*. The famous statue of *Hercules*, in the Farnese palace at Rome, is well known to the connoisseurs; this represents him, rising after the last of his twelve labours above reclined, leaning on his club, and holding the apples of the Hesperides in his hand. In this statue, as in all the other figures of him, he is formed, by the breadth of his shoulders, the spaciousness of his chest, the largeness of his face, and the firmness of his muscles, to express strength and a capacity of enduring great fatigue, which constituted the chief idea of virtue among the ancient heathens. His other attributes are his lion's skin, his club, and his bow.

Hercules is represented by the ancients as an exemplar of virtue; however, the *Hercules litas*, or drunken *Hercules*, is no uncommon figure, and his amours are described both by the poets and artists. Thus, the Cupids are made to take away his club, and he is exhibited in the posture of bending under a little boy; by which actions we perceive, that he, who conquered all difficulties, was a slave to love. The chief scene of his effeminacies was in Asia, whilst he lived with Omphale, queen of Lydia; and at length, viz. in the forty-ninth year of his life, he fell a sacrifice to the jealousy of his wife Dejanira, who, dreading the influence of his passion for Iole, the daughter of Eurymachus, king of Oechalia, poisoned his robe, so that he died in great agonies on mount Oeta. Ovid represents him as preparing his own funeral pile, and laying himself upon it with great composure. Met. ix. ver. 238.

The apotheosis of *Hercules*, or the establishment of his stars in the principal cities of Greece, is fixed by Thucydides, twenty-nine years before the taking of Troy. *Hercules* has been particularly honoured by the Greeks under the name of *Mosagetes*, the conductor of the Muses, and at Rome under that of *Hercules Musarum*. He is represented on medals with a lyre in his hand; and the reverse is marked with the figure of the nine Muses, with their proper symbols. Encyclopedic, and Spence's Polymnia, p. 113, Nc.

HERCULEAN alliad. See GINSENG, Cow PARSEY, and WOUND-ROSE.

HERCULEAN club. See TOOTH-ACH-REE.

HERCULEAN war, in Medicine, the *epilepsia*; thus called from the error of its attacks, and the difficulty of cure.

HERD, among Hunters, a company or assemblage of black or fallow beasts, in contradistinction to *stags*.

In the hunting language, there are various terms used for companies of divers kinds of game. We say a *herd* of hares and hocks, a *herd* of roes, a *rust* of wolves, a *ridgh* of martlets, &c. See MONTICQ.

HERDEWICH, HERDEWIC, or HERDEWICH, in our *Sacred Laws*, a grange or place for cattle and husbandry.

Et unus herdewichum apud Hethesum in pace, &c. Mon. Angl.

HERDING, among Sportsmen, is the reverse of BREAKING *horns*.

HEREDOE, the king's edict, anciently issued to command his subjects into the field.

The word is formed of the Saxon, *here*, army, and *hold*, mistress.

HEREDITAMENTS, in Law, are such immovable things as a man may have to himself and his heirs by way of inheritance; or which, not being otherwise bequeathed, do naturally and of course descend to him who is next heir of blood, and fall not to the executor or administrator as chattels do.

Hereditaments is a word of large extent, and is much used in conveyances; for by the grant of *hereditaments*, offices, dignities, manors, houses, and lands of all sorts, charters, rents, services, advowsons, conveyances, and whatever may be inherited, will pass.

HEREDITARY, something appropriated to a family, or

belonging thereto by right of succession, from heir to heir.

Of monarchies, some are *hereditary*, others elective: of *hereditary* monarchies, some descend only to the heir-male, as in France; others to the next of blood, whether male or female, as in England, Spain, &c. The dominions of the emperor are distinguished into *hereditary*, which are those he derives from his ancestors by right of blood and inheritance; and those he enjoys in quality of emperor, by virtue of his election.

HEREDITARY is also applied to offices and honours annexed to certain families. Thus the office of earl marshal and lord great chamberlain of England are *hereditary* in the families of the duke of Norfolk and the duke of Ancaster.

It is of no very long date, that the dignities of duke, count, &c. are *hereditary*.

The canon law has taken all possible precautions to prevent benefices from becoming *hereditary*.

HEREDITARY is also applied figuratively to good or evil qualities, habits, &c. capable of being transmitted by blood from father to son.

The good, king's evil, madness, &c. are *hereditary* diseases; i. e. they are sometimes transmitted from the parents in the flamen or first rudiments of the foetus; and such, probably, is the origin of numerous other chronic diseases.

HEREDITARY right denotes a right or privilege, in virtue whereof a person succeeds to the effects of his ancestors. The nonjurors, &c. hold *hereditary* right to be *divine* right, i. e. of God's own appointment; and consequently indispensible, or, as they call it, *indefeasible*. On this account they contend for the obligation of *hereditary* right in favour of the descendants of king James II.

HEREFELD, in our *Old Writers*, a tribute or tax levied for the maintenance of an army. See *SUSDY*.

HERESIARCH, arch-heretic, the founder or inventor of a heresy, or a chief and ring-leader of a sect of heretics. The word is Greek *heresiarcho*, compounded of *heres*, heresy, and *arch*, prince, primer, chief.

Thus Arias and Socinus are called *heresiarchs*, as being the founders and patriarchs of the Arias and Socinians. Simon Magus is recorded as the first *heresiarch* under the new law.

HERESY, an error in some essential point of Christian faith, maintained with obstinacy and dissimulation.

It is properly the obstinacy that constitutes the character of *heresy*, not the error. When a man is humble and ingenuous, ready and desirous to receive farther light and instruction, and when he gives every thing up against him in due weight, he is not guilty of *heresy*. *Errare possum, hereticus esse nolo*, is a celebrated maxim of St. Augustine.

Tertullian, in his treatise Of Prescriptions, defines *heresy* by *schisma*, agreeably to the etymology of the word. A heretic in this sense, is one who, knowingly and of his own choice, proposes, or even embraces, any new dogma or article of faith.

The word is formed of the Greek *hairesis*, from *airo*, I choose, which, among the ancients, had nothing of that odious signification attached to it by ecclesiastical writers of later times. It only signified a peculiar opinion, dogma, or sect.

In this sense they said, the *heresy* of the Stoics, of the Peripatetics, &c. meaning their sect, their system, &c.

Thus also in the New Testament, we read of the sect or *heresy* of the Sadducees, of the Pharisees, of the Nazarenes, &c. See Act. v. 17, ch. xv. 5. ch. xxiv. 5. ch. xxvi. 5. ch. xxviii. 22.

It seems difficult, in the law of England, precisely to determine what errors amount to *heresy*, and what not.

The statute 2 Hen. IV. cap. 15, declares those to be *heretics* who were teachers of erroneous opinions, contrary to the faith and blessed determinations of the holy church. And though the statute 25 Hen. VIII. cap. 14, declared, that offences against the see of Rome are not *heresy*, and the ordinary is restrained from proceeding upon mere suspicion, i. e. unless the party be accused by two credible witnesses, or an indictment of *heresy* be first previously found in the king's courts of common law; yet the statute 31 Hen. VIII. cap. 14, established the six most contested points of popery, viz. transubstantiation, communion in one kind, the celibacy of the clergy, monastic vows, the sacrifice of the mass, and auricular confession; and farther enacted and declared all opposers of the first to be heretics, and to be burnt with fire; and of the five last to be felons, and to suffer death. By stat. 1 Eliz. cap. 1, all former statutes relating to *heresy* are repealed, which leaves the jurisdiction of *heresy* as it stood at common law, viz. as to the institution of common censures, in the ecclesiastical courts; and, in case of burning the heretic, in the provincial synod.

fyed only, or, according to Sir Matthew Hale, in the diocesan also; but in either case the writ was not demandable of common right, but grantable or otherwise, merely at the king's discretion. See *De Hæretico Comburendo*. By this statute the term *heresy* is retained to such tenets as are either determinable by the words of the canonical scripture, or by one of the four first general councils, or by some other council which has only used the express words of scripture, or by parliament, with the assent of the convocation.

It is agreed that the convocation may and always might declare what opinions are heretical, and that a conviction before them was anciently a good foundation for the writ *De Hæretico Comburendo*; but it is doubted whether they can, at this day, convene and convict a heretic. A bishop, but no other spiritual judge, may punish a heretic by church censures; and a conviction before him was, at some say, anciently a good foundation for the writ *De Hæretico Comburendo*. But the temporal courts cannot punish a heretic as such, but only as a disturber of the public peace; yet such courts may incidentally take knowledge whether a tenet be heretical or not, as anciently, where bishops grounded their commitment of a man as a heretic on 2 Hen. IV. which empowered them to imprison for *heresy*; or even at this day, where a bishop pleads to a *quare impedit*, that he refused the clerk for *heresy*; in both which cases the temporal courts will relieve the party, unless the particular point charged against him be set forth, and such point appear to be heretical. But regularly, the temporal courts cannot determine what is *heresy*; and therefore if a man thinks himself aggrieved by a suit in the spiritual court *pro salute anime*, for *heresy*, his most proper remedy is by appeal not prohibition. Anciently an heretic convicted, refusing to abjure, or relapsing after abjuration, might be burnt by force of the writ *De Hæretico Comburendo*; but he forfeited neither lands nor goods: but though this writ is now abolished, and all the old statutes which gave a power to arrest or imprison persons for *heresy*, or introduced any forfeiture on that account, are repealed; yet by the common law, still in force, an obstinate heretic may be imprisoned by force of the writ *De Excommunicato Capiendo*, till he make satisfaction to the church. The civil magistracy has still a power of interposing with regard to any species of *heresy*; for, by stat. 9 and 10 Will. III. cap. 32. if any person, educated in the Christian religion, and having made profession of the same, shall by writing, printing, teaching, or advised speaking, deny the Christian religion to be true, or the holy scriptures to be of divine authority, or deny any one of the persons in the holy Trinity to be God, or maintain that there are more Gods than one, he shall for the first offence be rendered incapable of holding any office or place of trust; and for the second, be rendered incapable of bringing any action, being guardian, executor, legatee, or purchaser of lands, and shall suffer three years imprisonment without bail. But if, within four months after the first conviction, the delinquent will, in open court, publicly renounce his error, he is discharged at once from all disabilities.

HERESY is sometimes also used, by extension, for a proposition that is notoriously false in some other science.

Thus, it is a *heresy* in morals to say, that a man must be ungrateful. It is a *heresy* in geometry to say, that two triangles, whose angles are equal, are not similar.

HERETIC, in a general sense, is one that sets up to be the head, or chieftain to join himself to a particular religious sect.

Heretic, in a bad sense, according to the opinion of Whitty, Foster, and many others, is one who knowingly espouses a false doctrine, is inflexible in his profession, and asserts and defends what he is convinced is contrary to Christianity, and consequently supports the interest of a faction, in order to serve some bad designs. According to this opinion, a *heretic* not only entertains wrong sentiments of Christianity, but doth this wilfully, and with an ill intention: so that no mere error of the judgment can be *heresy*, nor a honest man, who is not condemned of himself, can possibly be a *heretic*.

The *heretics*, whom, in the New Testament, we are directed to avoid, were not the humble, modest, and peaceable, though erroneous Christians, who adhered to the authority of Christ, and desired to know and do his will; but the proud, pragmatical, turbulent party-men, who disturbed and divided the church by their impositions and innovations, on the terms of brotherly affection and Christian communion, and by assuming an authority over their fellow-Christians. Hereby, in the sense of scripture, doth not consist in simple error; nor were those *heretics* who were anathematized and persecuted; but only those who anathematized and persecuted others, refusing to acknowledge them for true Christians, on account of their

supposed or real mistakes; agreeably to this sense of the appellation, it is justly observed by Mr. Maier, that the pope is the greatest *heretic* in the world. See Haller's Notes, &c. vol. iii. disc. ix. p. 390. and Fumaeux's Letters to Judge Blackstone, p. 30.

A real *heretic* is properly he who maintains a false opinion, out of a spirit of obstinacy, fiction, or hypocrisy. A *heretic* makes a profession of Christianity, by which he is distinguished from an infidel, Jew, or idolater.

A man does not become an *heretic* by using a thing condemned or forbidden by the gospel, and of consequence repugnant to the Christian faith; but by a stiff, obstinate, wilful, turbulent adherence to an opinion opposite to some article of the Christian faith, whether it regard speculation or practice.

Others, however, both in the early ages of the church and in modern times, have extended the odious appellation of *heretics* to those that have been mistaken in judgment, who have erred in fundamentals, or doctrines reckoned of the greatest importance.

The sects of *heretics*, who have, at different times, disturbed the church, are innumerable.

The emperor Maximus, who usurped the throne from Gratian, was the first that decreed the pains of death to *heretics*.

By our own law, *heretics* were anciently to be burnt; and there was a writ *De Hæretico Comburendo*, which lay for that purpose.

HERETOCHS, among our *Saxon Antiquaries*, signified the same with *DUKES* or *duces*, denoting the commanders or leaders of their armies.

It appears, from Edward the Confessor's laws, that the military force of this kingdom was in the hands of the dukes or *heretochs*, who were constituted through every province and county in the kingdom, being selected out of the principal nobility, and such as were most remarkable for being *sapienter, fideles, et animici*. Their duty was to lead and regulate the English armies, with a very unlimited power; and because of their great power, they were elected by the people in their full assembly, or folk-mote, in the same manner as sheriffs were elected.

HERIOT. See *HARIOT*.

HERISSON, in *Fortification*, a beam armed with iron spikes, the points whereof are turned outward, supported in the middle by a stake, wherein is a pivot on which it turns: it serves at a barrier to block up a passage.

Herissins are frequently placed before gates, especially the portens of a town or fortress, to secure those passages which must of necessity be frequently opened and shut.

HERITAGE. See *INHERITANCE*.

HERMÆA, *Ægæna*, in *Antiquity*, a festival observed in honour of Mercury; yet there were several solemnities of this kind, some celebrated in Peloponnesus, others in Boeotia, Crete, &c. See Pott. *Archæol. Græc.* lib. ii. cap. 20. tom. i. p. 866.

In Crete, during the celebration of the *hermæa*, the masters served their slaves at table. This custom obtained likewise among the Athenians and Babylonians; as also among the Romans; witness the *SATURNALIA*.

HERMANNIA, in *Botany*, a genus of the *monadelphica pentandria* class. Its characters are these: the flower has a pitcher-shaped permanent envelopment; it has five petals, which twist against the sun with a tubulous empalement, but spread open above; it has five broad stamens joined in one body; in the centre is situated a roundish five-cornered germ, which becomes a five-cornered roundish capsule, with five cells opening at the top, inclosing many seeds. Miller enumerates nine species, all natives of the Cape of Good Hope.

HERMAPHRODITE, *Ægæphrodite*, a person who has both the sex, or the genital parts both of male and female.

The word is formed of the Greek *Ægæphrodite*, a compound of *Ægæa*, *Mercury*, and *Æphrodite*, *Venus*; q. d. a mixture of Mercury and Venus, i. e. of male and female. For it is to be observed, *Hermaphrodite* was originally a proper name, applied by the heathen mythologists to a fabulous deity, whom some represent as a son of *Hermes*, *Mercury*, and *Aphrodite*, *Venus*; and who being desperately in love with the nymph Salmacis, obtained of the gods to have his body and her's united in one. Others think this junction intended to show, that *Venus*, *Plutarch*, was of both sexes; as in effect, the poet Calvus calls *Venus* a god.

M. Spon observes, Hesychius calls *Venus Aphroditus*; and Theophrastus affirms, that *Aphroditus*, or *Venus*, is *Hermaphroditus*; and that, in the island of Cyprus, she has a statue, which represents her with a beard like a man. The Greeks also call *hermaphroditus androgynus*, q. d. man-woman.

Naturalists distinguish four kinds of *hermaphroditus*; whereof

whereof one kind only are the perfect *hermaphrodites*, or those who have the pædœa of both kinds; but these are rarely, if ever, found. It is affirmed, however, that there were once two such *hermaphrodites*, married to each other, and that each begot children on the other. See various instances of *hermaphroditism*, in a dissertation of M. Loffhagen, in the *Nor. Lit. Mus. Balth.* 1704. p. 105. Baulvine, *De Hermaphrod.* Ludov. Bousciol. *Tract. de Part. Form.* cap. 9. Aldrovand. *De Monstr.* cap. 1. Paul. Zwerch. *Quæst. Med. Legal.* tom. i. lib. vii. § 8. Others dispute all that has been said on the subject; maintaining, that the ill conformation of the parts of generation, the testicles being detained or concealed in men, and the clitoris longer than ordinary in women, have been the sole occasion of so erroneous a notion. To which may be added, the tumorous growths of the labia pudendi, which have sometimes passed for testicles. Dr. Quincy thinks that the frequent use of lascivious frictions and stimulations may contribute greatly to the extension of the clitoris, and make it pass with the ignorant for a penis. Thus, he adds, was the case in the celebrated instance of the two nuns at Rome, who, after they had lived women for many years, were said to have become men. But, on what grounds he asserts this we do not know.

"The extraordinary size of the clitoris, says Dr. Drake, and its propensities, sometimes, out of the body in infants, makes the women mistake such children for that sort of monsters called *hermaphrodites*. Of this kind I had one brought to me, the clitoris whereof hung out of the body so far, at about three years old, that it resembled very much a penis, but it wanted a perforation; and instead of that, just behind it, the urine issued at a hole, which was nothing else but the corner of the rim, the clitoris filling all the rest of the orifice; so that the parents mistook it for a boy, and as such called it; but the neighbour called it an *hermaphrodite*." *Anthropol.* p. 148.

Dr. Barrow has given us a treatise on this subject, where he contends to show the notion of *hermaphroditism* to be a vulgar error; and, in particular, that the Anglo-Negro, shown about this town from years ago, was a woman whose clitoris was overgrown. See his *Mechanical and Critical Enquiry into the Nature of Hermaphrodites*, Lond. 1741, 8vo. *Phil. Trans.* vol. xliii. p. 142.

The interpreters and commentators of the civil law hold, that an *hermaphrodite* has been chosen the male sex, as that which prevails most in him, may no longer do the office of a woman. And the French lawyers produce an arrêt of the parliament of Paris, whereby a young *hermaphrodite* was condemned to be burnt on that very account.

At Athens and Rome, they looked on *hermaphrodites* as ominous monsters, and precipitated them into the sea, as we are informed by Alexander ab Alexandro. Divers of the insect and reptile kind are truly *hermaphrodites*; particularly worms, snails, &c.

In the Menages of the French Academy, we have an account of this very extraordinary kind of *hermaphrodites*, which not only have both sexes, but do the office of both at the same time. Such are earth-worms, round tailed worms found in the intestines of men and horses, land-snails and those of fresh waters, and all the sorts of leeches. And, as all these are reptiles, and without bones, M. Poupert concludes it probable, that all other insects, which have these two characters, are also *hermaphrodites*.

The method of creeping practised in this class of *hermaphrodites*, may be illustrated in the instance of earth-worms. Ray's *Hist. Insect.* p. 2. These little creatures creep, two by two, out of holes proper to receive them, where they dispose their bodies in such a manner, as that the head of the one is turned to the tail of the other. Being thus stretched lengthwise, a little conical hump at pupilla is thrust forth by each, and received into an aperture of the other.

These animals, being male in one part of the body and female in another, and the body flexible withal, M. Homberg does not think it impossible that an earth-worm may couple with itself, and be both father and mother of its young; an observation which, to some, appears highly extravagant.

Among the insects of the soft or boneless kind, there are great numbers, indeed, which are so far from being *hermaphrodites*, that they are of no sex at all. Of this kind are all the caterpillars, maggots, and worms, produced of the eggs of bees of all kinds; but the reason of this is plain; these are not animals in a perfect state, but disfigurements which animals seek. They have no business with the propagating of their species, but are to be transformed into animals of another kind, by the putting off their several coverings, and then only they are in their

perfect state, and therefore then only show the differences of sex, which are always in the distinct animals, each being only male or female. These copulate, and their eggs produce these creatures, which show no sex till they arrive at that perfect state again. *Mém. Acad. Par.* 1707. Mr. Hunter, in his account of the free martin, has lately observed, that, in many of the inferior tribes of animals, the male and female parts of generation are found to be united in the same animal, which, from possessing both parts, are called *hermaphrodites*. These *hermaphrodites* he divides into the natural, and unnatural or monstrous. The natural kind belongs to the inferior and more simple order of animals; but as animals become more complicated, and each part is more confined to its particular use, a separation of the two necessary powers for generation takes place in them; and he apprehends that the unnatural kind may be occasionally found among every tribe of animals having distinct sexes, but that it is more common in some than in others. The human species has the fewest; but in the horse, ass, sheep, and cattle, they are very frequent. *Phil. Trans.* vol. lxxi. part i. p. 279, &c. See *Free Martin*.

HERMAPHRODITE is also applied in a botanical sense.

The latest botanists make a division of plants, which they call *hermaphrodites*, as having both the male and female parts of generation, viz. the stamens and pistil in the same flower.

These *hermaphrodite* flowers are sometimes distinguished into male *hermaphrodites* and female *hermaphrodites*; the case, in which this distinction, which is seldom necessary, occurs, is, when the flower contains the parts belonging to each sex, but one of them proves abortive or ineffectual: if the defect be in the stamens, it is a female *hermaphrodite*; if in the pistil, a male one.

HERMAPOLLOON, in *Antiquity*, a statue or figure composed of Mercury and Apollo, representing a young man with the symbols of both divinities, viz. the petasus and caduceus, with the bow and lyre.

HERMATHENA, *Heracles*, in *Antiquity*, a statue representing Mercury and Minerva both in one.

The word is a compound of *Hermes*, Mercury, and *Athena*, a Greek name for Minerva.

M. Spon gives diverse figures of *Hermathena*, in his *Rech. Cur. de l'Antiqu.* p. 98. They are a sort of statues raised on square pedestals, after the manner of *Hermes*, only that the attributes of Minerva are added thereto. See *Hermes* below.

HERMERACLES, in *Antiquity*, a statue compounded of the figures of Mercury and Hercules.

M. Spon gives us a type of an *Hermacrus*, *Rech. Cur. de l'Antiq.* p. 66. fig. 13. The same, he observes, was given to a divinity represented after the manner of *Hermes*, with the additional attributes of *Hercules*, viz. a lion's skin and a club. This he ascribes to the custom among the Greeks of placing the statues of Mercury and Hercules in the academy and gymnasium, as both one and the other presided over the exercises of the youth.

HERMEROS, compounded of *Epos*, Mercury, and *Eros*, Cupid, a statue formed of Mercury and Cupid.

HERMES, or *HERMA*, among *Antiquaries*, a sort of square or cubical figure of the god Mercury, usually made of marble, though sometimes of brass or other materials, without arms or legs, and planted by the Greeks and Romans in their cross-ways.

Servius gives us the origin thereof, in his Comment on the eighth book of the *Æneid*. Some shepherds, says he, having one day caught Mercury, seized by the Greeks *Hermes*, asleep on a mountain, cut off his hands; from which he, as well as the mountain where the action was done, became denominated *Cyllenius*, from *κύλλη*, *maimed*; and thence, adds Servius, it is, that certain statues without arms are denominated *Hermes* or *Hermæ*. But this etymology of the epithet of *Cyllenius* contradicts most of the other ancient authors; who derive it hence, that Mercury was born at *Cyllene*, a city of Elis, or even on the mountain *Cyllene* itself, which had been thus called before him.

Sundae gives a most explication of this custom of placing statues of Mercury without arms, in the following words, says he, were statues of Mercury placed at the entrances or porches of the houses and temples at Athens; for this reason, that, as Mercury was held the god of speech and of truth, square and cubical statues were peculiarly proper; having this in common with truth, that, on what side soever they are viewed, they always appear the same.

It must be observed, that Athens abounded more than any other place in *Hermæ*; there were abundance of very singular ones in diverse parts of the city, and they were indeed one of the principal ornaments of the place. They were also placed in the high-roads and cross-ways, because Mercury, who was the conductor of the gods, pre-

fixed over the highway; whence he had his surname of *Trivius*, from *trivium*; and that of *Viaticus*, from *via*. From Suidas's account, above cited, it appears, that the terms, *termini*, used among us in the door-cales, balconies, &c. of our buildings, take their origin from these *Athenian Herms*; and that it was more proper to call them *herms* than *termini*, because, though the Roman *termini* were square stones, whereon a head was frequently placed, yet they were rather used as land-marks and more stones than as ornaments of building.

HERMESIA, a name given by some authors to hermetic chymistry.

HERMETIC, or **HERMETICAL**, *art*, a name given to chymistry, on a supposition that Hermes Trismegistus was the inventor thereof, or that he excelled therein. See **ALCHYMISTRY** and **CHYMISTRY**.

We know but little of this Hermes; only that he was an ancient King of Egypt, a thousand years prior to *Aesculapius*. *Zozimus Panopolis* mentions him, as having wrote of natural things; and there are several pieces still extant under his name, but they are all supposititious.

HERMETICAL philosophy is that which undertakes to solve and explain all the phenomena of nature, from the three chemical principles, *air*, *fulphur*, and *mercury*.

A considerable augmentation was made to the ancient *Hermetical philosophy*, by the modern doctrine of *alkali* and *acid*.

HERMETICAL phlogiston, or *medicula*, is that system or hypothesis in the art of healing, which explains the causes of diseases, and the operations of medicine, on the principles of the *Hermetical philosophy*, and, particularly, on the system of *alkali* and *acid*.

HERMETICAL seal, a manner of stopping or closing glass vessels, for chemical operations, to very accurately, that nothing can exhale or escape, not even the most subtle spirits.

It is performed by heating the neck of the vessel in the flame of a lamp till it be ready to melt, and then with a pair of pincers twisting it close together. This they call putting on *Hermes's seal*.

There are also other ways of sealing vessels *Hermetically*; viz. by stopping them with a plug or stopple of glass, well luted into the neck of the vessel; or, by running another ovum philosophicum upon that wherein the matter is contained.

HERMARIOCRATES, or **HERMARIOPOLITES**, in *Antiquities*, a deity, or figure of a deity, composed of Mercury, and Harpocrates the god of silence.

M. Spon gives us a *Hermariopocra* in his *Rech. Cur. de l'Antiquite*, p. 98. fig. 15. having wings on his feet like Mercury, and laying his finger on his mouth like Harpocrates. It is probable they might mean, by this combination, that silence is sometimes eloquent.

HERMIANI, or **HERMIATIS**, a sect of heretics in the second century, thus called from their leader Hermias. They were also denominated *Scienciani*.

One of their distinguishing tenets was, that God is corporeal. Another, that Jesus Christ did not ascend into heaven with his body, but left it in the sun.

HERMIT, **EREMITE**, **EREMITA**, a devout person retired into solitude, to be more at leisure for prayer and contemplation, and to disencumber himself from the affairs of the world.

The word is formed from the Greek *ἔρημος*, *eremos*, *wilderness*; and, according to the etymology, should rather be written *eremit*, the spirit being lost.

An *hermit* is not reputed a religious, unless he have made the vows.

Paul, furnished the *Hermit*, *Paulus Eremitanus*, towards the close of the second century, is usually reckoned the first *hermit*, though St. Jerome, at the beginning of the life of that saint, says, it is not known who was the first. Some go back to St. John the Baptist, and others to Elias.

Others make St. Antony the founder of the *hermetical* life; but others take him to have only rekindled and heightened the fervour thereof, and hold, that the disciples of that saint venerated St. Paul for the first person that practised it, who fled into the most solitary deserts of Thebais, where he led, during the space of ninety years, a life more worthy of a savage animal than of a rational being. Nevertheless this unbecoming manner of life was very common in Egypt, Syria, India, and Mesopotamia, not only long before his time, but even before the coming of Christ; and it is still practised among the Mahometans, as well as the Christians, in those dry and burning climates: for the glowing atmosphere that surrounds these countries is a natural cause of that love of solitude and repose, of that indolent and melancholy disposition, that are very common among their languid inhabitants. The persecutions of Decius and Valerian are supposed to have been the occasion; though the fa-

natical system of theology, derived from the Platonic school, and adopted by Origen and his disciples, that prevailed at this period, contributed to form the taste and temper of the first *hermits*.

Several of the ancient *hermits*, as St. Antony, &c. though they lived in deserts, had yet numbers of religious accompanying them.

There are also divers orders and congregations of religious, distinguished by the title of *hermits*; as, *hermits* of St. Augustine, of St. John Baptist, of St. Jerome, of St. Paul, &c.

HERMITS of St. Augustine, is a religious order, more frequently called *Augustines*, or *Austinians*.

It is commonly pretended to have been instituted by that father, but without much ground. This is pretty certain, he laid the foundations of a monastic order about the year 382, and retired to his father's estate near Tagilla, to lead a religious life with some companions; but it does not at all appear, that this order has subsisted ever since; nor that the *hermits* of St. Augustine are descended, without interruption, from them.

This order, in reality, only commenced under pope Alexander IV. in the middle of the thirteenth century, and was formed gradually by the union of divers congregations, as appears from his bull, published in the *Mare Magnum* of the *Augustines*.

That pontiff undertook this union from the first year of his pontificate, viz. the year 1254. It was the year 1250 before the superiors of all the congregations could be got together. In the general chapter the union was effected; Lanfranc Septala, a Milanese, was chosen general, and the order divided into four provinces, viz. those of France, Germany, Spain, and Italy. See **Augustine**.

Since that, other orders have been united to the *hermits* of St. Augustine; as the Poor Catholics, &c. and the order now consists of forty-two provinces.

After to many unions, the order began to divide again into separate congregations, according to the relaxations and reformations that afterwards got footing. Such are the bare-footed *Hermits* of St. Augustine, the congregation of Centorbi, or the Sicilian Reform; the congregation of the Colanites, in Calabria, &c.

There are also several congregations of nuns, under the appellation of *Hermits* of St. Augustine.

There is also a third order of *hermits* of St. Augustine.

HERMITS of Britanni, was a congregation formed under pope Gregory IX. who gave them the rule of St. Augustine.

Their first hermitage or abode was in a solitary place, called Britanni, in the marquisate of Ancona; whence the name. They led a very austere life; they never eat any meat, and fasted much.

HERMITS of Comaldus. See **CAMALDULEANS**.

HERMITS of St. Jerome. See **JEROMYNITES**.

HERMITS of St. John Baptist, was a religious order in Navarre, whose principal convent or hermitage was seven leagues from Pampelona.

Till the time of Gregory XIII. they lived under the obedience of the bishop of that city; but the pope confirmed them a religious order, approved their constitutions, and admitted them to make the vows. Their way of living was exceeding austere; they went bare-footed, wore no linen, lay on boards, with a large stone for their pillow, and bore a large wooden cross on their breasts.

Their house was a kind of *laura*, rather than a convent, cut out into cells, in which they lived solitarily in the middle of a wood.

HERMITS of St. Paul, the first *hermit*, is an order formed in the thirteenth century, by the union of two bodies of *hermits* in Hungary, viz. those of St. James de Patch, and those of Pillis near Zante.

Upon being incorporated, they chose St. Paul, the first *hermit*, for the common patron and protector of their order, and assumed his name. They multiplied very considerably in Hungary, Germany, Poland, and other provinces; and, at length, came to have seventy monasteries in Hungary alone; but the revolutions and wars in that kingdom reduced them again.

HERMIT-fish, a name by which some call the long-tailed *SCILLA*, with a soft tail, and the right claw the larger. **HERMITAGE** properly signifies a little hut or habitation, in some desert place, where a *hermit* dwells.

HERMITAGE is also popularly attributed to any religious cell, built and endowed in a private and reclusive place, and thus annexed to some large abbey, of which the superior was called *hermit*.

HERMODACTYL, or *Snake-headed Iris*, in *Botany*. This genus is by Dr. Linnaeus joined to the *IRIS*; the characters of the flower agreeing pretty well with those of that genus, from which, however, Tournefort has separated

rated it by the difference of the root. Its characters are these: it has a lily-shaped flower, consisting of one leaf, shaped exactly like the iris; but has a tuberos root divided like two or three dugs, like oblong bulbs. There is one species.

This plant is easily propagated by its tubers, which should be taken off and planted soon after the green leaves decay; for if they are kept long out of the ground, they shrink and rot when planted. The roots are apt to run deep in the ground, when they seldom produce flowers; in light soils, therefore, it may be proper to lay a thickness of rubbish under the border where they are planted. Miller.

HERMODACTYLUS, in *Medicine*, a drug used as a gentle purgative, &c.

The *hermodactylus* is a root about the size of a little chestnut, in figure resembling a heart; ruddy without, very white within; of a light spongy substance, without fibres; easily broken, and reducible into powder like flour; of a sweetish taste, but somewhat viscid. It is brought to us dried, from Egypt, Syria, and Turkey.

There have been too generally supposed to be roots of this species of meadow-saffron, called by authors *calicutum Chamaele*, *herbaria fritillaria vulgaris variegata*, *folia undulata*, or the Chinese meadow-saffron, with undulated leaves, and with flowers chequered like those of the fritillaria. They were in great use among the ancients as a purge; but their operation is very slow, tedious, and fatiguing, and therefore they have been commonly quickened with aloes and other cathartics. They are best corrected by being joined with aromatics, and are now sometimes used, mixed with jalap, in rheumatism. The women of Egypt eat the fresh roots roasted, to make them grow fat.

Hermodactylus were chiefly used to purge pituitous humours of the brain and joints. They were deemed so efficacious in soothing the malignacious glands, and preserving them from the lodgments of gritty matters, which occasion the gout and arthritic complaints, that they were denominated, by some writers, *urinae articularum*. They also promote sweat. They are now expunged by the colleges both of London and Edinburgh from their catalogues of officinals.

HERMODE, in *Mythology*, the name of a deity worshipped by the ancient inhabitants of the North, or Goths; he was reputed to be the son of Odin, the first of their gods.

HERMOGENEAN *ade*, in *Law*. See *CONC.*

HERMOGENIANS, a sect of ancient heretics, denominated from their leader Hermogenes, who lived towards the close of the third century.

Hermogenes established matter as his first principle, and regarding matter as the fountain of all evil, he maintained that the world, and every thing contained in it, as also the souls of men and other spirits, were formed by the decay from an uncreated and eternal mass of corrupt matter.

The opinion of Hermogenes, with regard to the origin of the world and the nature of the soul, were warmly opposed by Tertullian.

The *Hermogenians* were divided into several branches under their respective chiefs, viz. Hermiani, Sclerici, Materici, &c.

Some will have the Manichees also to have sprung from the *Hermogenians*.

HERNOPAN, in *Ancient Mythology*, a figure composed of Mercury and Pan.

HERMOSIRIS is a statue of Mercury and Osiris, with the distinct attributes of these divinities united; viz. the caduceus of Mercury, and the head of a hawk with an eagle for Osiris.

HERMULES were two small statues of Mercury placed in the circus at Rome.

HERN. See *HERON*.

HERNANDIA, in *Botany*. See *JACK* in a *box*.

HERNIA, in *Medicine*, a descent of the intestines or omentum out of their natural place; or rather, the tumor formed by that descent, popularly called a rupture.

The word is Latin, *hernia*, and originally signifies the same with *tumor scroti*, called also *varix*. Palsacian observes that the ancient Maris gave the appellation *hernia* to rocks; whence some will have *hernia* thus called, *propter asperitatem*, on account of their hardness. Scaliger chooses rather to derive the word from the Greek *ἑρνη*, *varix*, *branch*.

When the peritonaeum happens to be extraordinarily dilated, (for it is hardly ever burst or broken) a portion of the omentum, a part of the intestinal canal, and sometimes (though very rarely) the stomach, fall out of their place, and form these sorts of tumors, called *hernia*.

The liver, spleen, uterus, bladder, &c. have at different times been found in different *hernia*, but these are cases that very seldom occur.

They happen most usually in the inguen or groin, in the labia pudendi, or in the scrotum and navel; though, sometimes, in other places, as above and below the navel: in the side, far above the inguen; in the upper part of the thigh, near the spine, &c. and as they make their appearance in the groin, scrotum, thigh, navel, or belly, they are hence called *inguinal*, *scrotal*, *femoral*, *umbilical*, and *ventral*.

Hernia are often occasioned by blows, violent concussions, over-stretching in vomiting, and hard labour, or wind; from which last cause it is, that they are so frequent in children, and so easily helped by timely care: in adults they are generally incurable. From *hernia* frequently arise the iliac passion, and sometimes inflammations, and even gangrenes of the intestines.

Hernia are variously denominated, both according to the parts displaced, and those whereon they fall.

If a *hernia* be formed by the descent of a portion of the intestines, which is the most usual kind of rupture, it is called *ENTEROCÆLE*, *hernia inguinalis*.

If, instead of the intestines, the omentum be fallen, it is called *EPIDIDOCÆLE*, or *hernia omentalis*.

A descent of both is called *ENTERO-EPIDIDOCÆLE*, or compound rupture.

If the intestines fall on the navel, it is called *OMPHALOCÆLE*.

If a piece of the gut or caul falls through the perforation of the obliquus tendens into the groin, it is called *ATHROCÆLE*, or *inguinalis*; but if the scrotum be occupied by either of them, the rupture is said to be complete, and is called *OSCROCÆLE*: the latter was formerly attributed to the laceration of the peritonaeum, and the former merely to its dilatation. But it has been more lately discovered, that both the scrotal and femoral *hernia* descend from the abdomen by openings which are natural to every human body. See the sequel of these articles.

Hernia have been also distinguished by different circumstances that attend them, into congenial, incarcerated, &c. There is another distinction of *Hernia* into true, and false or spurious: the former are occasioned by the removal of certain parts from their natural situation, whilst the parts themselves remain, in general, sound, and free from disease; such are those which have been already enumerated: the latter are originally disorders of the parts in which they are seated, occasioned by a various distention of the spermatic vessels, extravasated blood or water within the membranes either of the testicle or of the spermatic vessels, an inflammatory enlargement, and a scirrhous or cancerous state of the testis itself. The spurious *hernia* derive their names either from their supposed contents, as the *HYDROCÆLE*, *HEMATOCÆLE*, and *HYDROCELE*; or from the alteration made in the dissection by the natural structure of the parts concerned, as the *VARIOCÆLE*, *CIRCOCÆLE*, and *SARCOCÆLE*; to which some have added the *HERNIA tumoralis*.

A kind of prominent tumor in the throat is frequently also called *BRONCHOCÆLE*, or *hernia gutturalis*.

To this general account of the several species of *hernia*, we shall subjoin a more particular description of each, referring to those that are elsewhere described in the course of this work.

HERNIA aquosa. See *HYDROCÆLE*.

HERNIA carnea. See *SARCOCÆLE*.

HERNIA congenita, or *congenial hernia*, denotes a tumor, occasioned by a portion of intestine or omentum, which is found in contact with the naked testicle, and contained in a sac or bag formed by the *tunica vaginalis testis*. The testis are originally situated in the abdomen, and gradually descend, near the time of birth, through the orifice adapted for their passage, first into the groin, and then into the scrotum, each carrying along with it a peritoneal coat, by which it was covered in the cavity of the belly, and being received into a fasciculus or sac-like membranes bag, which, when closed, constitute the *tunica vaginalis*, and are true and original processes of the peritonaeum. The upper part or neck of these sacs passes through the apertures in the tendons of the external oblique muscles, and the lower part lies enveloped in the common cellular membrane on the outside of these muscles, in the groin. These fasciculi having no communication with the abdomen by means of their orifices until birth, and often for some time longer. However, when these orifices are closed, a bag or cavity is formed, which contains within it the testicle, covered only by its *tunica albuginea*, and which has never afterwards any communication with the orifice into the cavity of the belly. Nevertheless, it sometimes happens, that, while these passages are open, a piece of the intestine or omentum intrudes into the orifice of the *tunica vaginalis*, prevents its closing, and thus a *hernia* fac is formed of the vaginal coat of the testis, containing the intestine

intestine or omentum, and the testicle in immediate contact with each other. This is the congenital *hernia*; a disease unknown till within these few years, but by no means an uncommon one.

This discovery was made by Dr. Hunter, in 1755, assisted by his brother Mr. John Hunter; and it is ingeniously accounted for and explained in Dr. Hunter's Medical Comment. N^o 1. and by Mr. Pott, in his account of the Congenital *Hernia*, published in 1757, and in his Remarks on the Hydrocele, published in 1762.

The *hernia*, now described, appears in very early infancy, and, like all other kinds of ruptures, should be reduced, and constantly kept up by a proper bandage, whenever this method is practicable; and when attended with symptoms of stricture, it requires the same assistance as the common *hernia*. But if it should happen, that a piece of the intestine or omentum has descended low into the sac, while the testicle is in the groin, or even within the abdomen, the application of a *truss* would be highly improper; for it might either prevent the descent of the testicle from the belly into the scrotum, or injure it, and occasion much pain without any benefit. No such bandage should, therefore, be applied to the rupture of an infant, unless the testicle can be fairly felt in the scrotum, after the gut or canal is replaced; and, when it can be felt, a *truss* cannot be put on too soon. There are other circumstances, which require the attention of a surgeon, in the management of this disease, for which we refer the reader to Mr. Pott's *Chirurgical Works*, vol. ii. p. 161, &c. 1759.

HERNIA CRURALIS. See **HERNIA FEMORALIS.**

HERNIA CYSTICÆ VESICÆ, is the *hernia* of the urinary bladder. This is liable to be thrust forth, either through the opening in the oblique muscle, like the inguinal *hernia*, or under Poupart's ligament, like the femoral *hernia*. The portion of the bladder which is liable to protrusion is not covered by the peritonæum, and therefore this *hernia* differs from every other in having no hernial sac.

This kind of *hernia*, in a recent state, is easily reduced, and kept from returning, by a proper bandage; but if the outer surface of the bladder adheres to the cellular membrane, which is the case in the advanced state of this disorder, the urine cannot be discharged without lifting up and compressing the scrotum, and the patient must be content with a suspensory bag. If this *hernia* be complicated with a bubonocoele, and the operation becomes necessary, great care is required lest the bladder should be opened instead of the sac.

M. Merz concludes, that *hernia* of this kind never arise from mere accident, but, when they do happen, they must be the effect of an original ill conformation of the bladder of urine, he says, is too big to pass through the annulus, or ring, which the intestines pass through; and, besides, it is fastened too strongly on all sides to admit of a descent. M. Petit, however, is of a different opinion, and maintains, that *hernia* of the bladder may be produced after the ordinary manner of others. *Mém. de l'Acad.* 1717.

HERNIA FEMORALIS is formed by the depression of the omentum or intestine into the upper and fore-part of the thigh through the arch made by the ligamentum Poupartii, or, as others call it, the ligamentum Fallopii, between the points of its attachment to the os ilion and the os pubis.

The hernial sac, in this case, if it be not greatly extended, lies between the crural vessels and the os pubis on which it rests. The method of attempting reduction, and the treatment of the patient in case of difficulty, are the same as in an inguinal *hernia*; except that in this *hernia* the pressure ought to be made directly upward, or a little towards the pubes.

There is another kind of *hernia femoralis*, called *hernia femoralis magna ipsi*, which happens when the intestines or omentum fall through the great hole of the ischium into the internal part of the thigh, between and under the two anterior heads of the triceps muscle. In this case, no pressure nor operation can be attended with success.

HERNIA FLATULENTA. See **PNEUMATOCELE.**

HERNIA GASTRALIS. See **BRONCHOCÆLE.**

HERNIA HUMERALIS has been generally supposed to be a disease of the testicle itself, but it appears, from some late observations, that its proper seat is the tunica vaginalis, which is very considerably enlarged as well as the spermatic chord, whilst there is no appearance of disease in the testis. Mr. Pott ascribes it to the distension of the inflammatory kind, occasioned most commonly by an irritation in that part of the urethra where the vasa deferentia or vesiculæ seminales terminate. It generally proceeds from venereal complaints, though sometimes from external bruises. This disorder is attended with pain and heat, and most frequently fever. When it proceeds

from the stoppage of a venereal gonorrhœa, *hirci purgatives* are useful in order to produce a discharge; vomits also, and bleeding are serviceable for removing the inflammation and tumor. The topical applications should be of the astringent and fluidizing kind, such as Goulard's fusturine water, or a mixture of vinegar and brandy. When the inflammatory symptoms abate, mercury may be prescribed internally, and the subsequent correlative force may be rubbed on the scrotum every night, either to prevent or remove any degree of inflammation. When a suppuration cannot be prevented, an emollient cataplasm must be applied warm, and continued till it produces a discharge of matter. If the issue be useful, care must be taken that the testicle is not wounded. *Med. Obs.* vol. iii. art. 17. Mosby's's Dict.

HERNIA INCOGNITA, cystica or strangulated rupture, derives its name from this circumstance, that the protruded parts of the omentum or intestine, on account of their size, inflammation, or distension of the gut by gases or wind, the adhesion of either of them to the hernial sac, &c. the smallness of the aperture of the tunica through which the *hernia* passes, or any other cause, cannot be replaced without difficulty, pain, and hazard.

The symptoms of this disease are a swelling of the groin or scrotum, residing the impressions of the fingers; and when the *hernia* is of the intestinal kind, it is painful to the touch; an increase of pain by coughing, sneezing, or standing upright; a sickness of the stomach, and frequent inclination to vomit; and a stoppage of all discharge by the anus, attended with a frequent hard pulse and some degree of fever. The immediate cause of these symptoms is a stricture made on the prolapsed part of the gut, by the borders of the natural aperture in the tendon of the oblique muscle, which interrupts the passage of the aliment and faeces, disturbs the peristaltic motion of the whole canal, obstructs the circulation of the blood through its vessels, and, without speedy relief, brings on a mortification.

Writers are not agreed, whether this stricture be owing to a disease originally in the intestine, or to its disengagement and distention. The latter opinion has been generally received; but there are many circumstances, which deserve the surgeon's attention, that favor the former supposition; and when this is the case, the disorder becomes more alarming and dangerous. In those cases, where all the mischief arises from the mere prolapsus and stricture, the returned intestine becomes immediately pervious, and recovering its peristaltic motion, keeps its place and performs its office; but if, by previous distension, it is rendered impervious and deprived of its motion, it cannot execute its function, it remains violently distended, and is, with great difficulty, kept within the belly, after it has been replaced.

Whatever be the immediate cause of this kind of *hernia*, the surgeon should first endeavour, by gentle means, to restore the protruded parts to their proper situation in the belly; for this purpose, the patient should be laid in a supine posture, with his trunk somewhat lower than his thighs, and with the thigh on the diseased side so elevated, as to contribute as much as possible to the relaxation of the abdominal aperture; and thus, by keeping the testicle from ascending and the intestine from descending, and continued gentle pressing of the tumor, the intestine may be made to return. When the difficulty is considerable, the posture of the body should approach nearly to that which is commonly called standing on the head. If this attempt fails, recourse must be had to frequent and copious bleeding, the warm bath, cathartics, the application of cataplasms, fomentations, embrocations, &c. acid stimulating glysters and suppositories frequently repeated, particularly those of the smoke of tobacco, and a composition of fat, honey, and aloes, boiled to a proper consistence. Omental ruptures are generally more capable of reduction than the intestinal; but when, by adhesion to the sides of the hernial sac, or any alteration in their firm, they cannot be reduced, their weight must be suspended in a bag or truss, and thus rendered as little troublesome as possible.

When the parts are properly reduced, they should be kept from falling down by a bandage or truss, the pad of which is made to constantly press against the opening in the abdominal tunica, and to keep the gut or canal from protruding, and bring the sides of the hernial sac as near as possible to each other. After the operation is completed, the body should be kept open, and the diet and regimen be low and sparing, while the least degree of tension or pain remain.

If the means above recited fail of effect, and the symptoms of the disorder increase, the next remedy, which should be applied to without delay, is a surgical operation, in order to disengage the parts where the stricture lies, before they become gangrenous. The manner of performing

performing the operation, as described by Mr. Pott, is as follows: the patient must be laid on his back, on a table of convenient height, with his legs hanging easily over the end of it; and then the operator, with a straight dissecting knife, must make an incision through the skin and membrane adiposa, beginning just above the place where the intestine passes out from the belly, and continuing it to the lower part of the scrotum. When the adipose membrane is divided, there will appear a few small, distinct, tendinous bands, lying close on the hernial sac, which must likewise be divided, as well as the sac itself. The incision in the sac, which requires caution and steadiness, because of its different degrees of thickness in different kinds and stages of the *hernia*, should be made about an inch and a half below the stricture, and the opening be sufficient to admit the end of the operator's fore-finger, which, introduced into the aperture, will serve as a director, and upon this a narrow-bladed, curved knife, with a bold probe-point, the point of the knife being always short of the extremity of the finger, will serve to divide the sac quite up to the opening of the tendon, and down to the bottom of the scrotum. When the sac is first divided, there issues from it a fluid, which varies in quantity, colour, and consistence, according to the date, size, and some other circumstances attending the rupture. The sac being laid open, the intestine immediately protrudes, unless it happens to be enveloped in the omentum: the operator is now to try, whether by gently drawing out a little more of the gut, and reducing its bulk, he can return it back to the belly without dividing the tendon; but if this cannot be easily accomplished, it is better to decline attempting it. In order to divide the stricture with the least hazard, the surgeon should first attend to the fracture and direction of the parts; and, as the natural opening in the tendon of the oblique descending muscle, through which the *hernia* passes, is formed by a kind of separation of the fibres from each other, and its direction is the same with that of the tendon, or obliquely downward from the os ilion to the os pubis, the knife should be so managed as to continue this separation, by applying its edge to the superior and posterior part of the oval, and carrying it upward and obliquely backward till a sufficient opening is obtained: this opening should afford room for passing the end of the finger on the inside in case of any adhesion. When the sac and stricture are divided, the contained parts will come into view, and their state may be judged of by the surgeon. If they appear to be found and unconnected, they should be immediately reduced. In returning the intestine, the part which came out last should be put in first, that the gut may not be doubled on itself; and the fingers, in this operation, should be applied to that part of the intestine which is connected with the mesentery, rather than with its convex part: during the reduction, the leg and thigh of the patient on the ruptured side should be elevated. If the intestine be accompanied with a portion of the omentum, the latter should be returned first. Slight adhesions of the parts of the intestines to one another, to the omentum, or to the hernial sac, may be separated without danger. When the prolapsed part is replaced, a considerable part of the hernial sac may be safely removed, no part of it being of any consequence, except that with which the spermatic vessels are connected. If the protruded parts, by neglect, decay, or inflammation, are so diseased, by gangrene or mortification, as not to be fit for immediate reduction, some previous attention will be necessary: the diseased part of the omentum may be cut off from the sound; and this has been the general practice. The common way of doing this has been by making a ligature just above the affected part, cutting off what is below the ligature, and leaving the ligature to hang out of the wound, that it may be more easily taken away when it is cast off. But Mr. Pott condemns the use of the ligature as needless and pernicious, and observes, that any portion of the canal may be cut off without any previous tying. If the gangrene or sphacelus has seized the intestine, and consists of a black spot only, which, by eating out, might endanger the dividing its contents into the belly, this inconvenience may be prevented by connecting the upper part to the wound by means of a needle and strong ligature; so that, when the mortified part separates, the faeces may be for some time discharged by the wound; after which it has been known to contract gradually and heal: but whatever be the event, this method of securing the gut should never be omitted. If the altered portion of the gut be large, and requires excision, the divided parts must be united by future, and both fastened to the inside of the belly, at the upper part of the wound, so that if the union does not succeed, the faeces may be discharged, if possible, through the groin; but if the two ends cannot be

brought together, they must both be connected with a proper needle and a strong ligature to the upper edge of the wound. The dressing should be soft and light, and the patient must observe the most rigid severity of diet, and the most perfect serenity of body and mind. Old age is an advantage in performing the operation for *hernia*, because old people's guts are not so liable to inflame or gangrene as those of young persons. After all, the hazard of success is so great, and the utmost power of art so little, says Mr. Pott, that what lapsis fuit to Aesculapio, with relation to his cure, may be applied here:

*Non hoc humanis opibus, non arte magistra
Prevenimus, neque te Aesculapio sine doctore ferocet:
Major agit diu.*

Pott's Works, vol. ii. p. 100, &c. 1779. Heister's Surgery, part ii. §. 5, cap. 117.
See an account of a strangulated *hernia*, by Mr. Ellis, Med. Obs. vol. iv. art. 30.

HERNIA inguinalis, or rupture in the groin, called also **HYMOCELE**, is occasioned by the descent of a portion of the intestine, most commonly of the ilium, and often of the cecum, or colon, or omentum, through the ring of the abdominal muscles into the groin. This is called an incomplete rupture, in contradistinction to the *scrotal* or *osculocela*. The sign of an inguinal and scrotal rupture is a swelling in the groin, or in the upper part of the scrotum, beginning at the opening of the abdominal muscles, the appearance of which will depend on the nature and quantity, and state of its contents. If the tumor be formed by a small portion of the intestine, it will be proportionally small; and when it is distended with wind, or inflamed, or has any degree of stricture upon it, it will be tense, and resist the impression of the finger, and handling of it will occasion pain. But if there be no stricture or inflammation, the tension of the tumor, whatever be its size, will be inconsiderable, unless the patient coughs; and no pain will attend the handling of it. The reduction of this *hernia*, in the state last described, is very easy, and requires only the most gentle means; the intestine generally slips up at once, and in its return makes a kind of gurgling noise.

If a portion of the omentum hath descended, the tumor will be more flabby and compressible, and its surface will be more uneven; the scrotum will assume a more oblong appearance than it bears in an intestinal *hernia*; and when the quantity of its contents is large, and the patient adult, it may in some measure be distinguished by its weight. In this case the return is not so speedy as in the former, nor attended with the same noise, and requires to be followed by the finger to the last. See **EPIDIOCELE**.

If both the intestine and omentum have descended, the characteristic marks will be less distinct, and some degree of experience will be necessary, in order to distinguish it from other complaints. When this *hernia* is reduced, the intestine returns first, and the omentum feels flabby, but, being farther compressed, soon follows it. See **EXTRO-EPIDIOCELE**.

Hernia, where the omentum falls down with the intestine, are more dangerous than where the gut is alone, because the omentum hinders the reduction of the gut, grows to the rings of the muscles, vessels, and forms a thick ring, which strangulates the gut. See Phil. Trans. N° 450. 1672. See **HERNIA incarcerata**.

In every kind of rupture, as soon as the parts are returned, their descent should be prevented by the application and constant use of a Roel truss, which should be well made and properly fitted: the use of a truss by infants and young persons, and in recent cases, will serve to compress the neck of the *hernia* far, while it is in its firm and thin state, so as to quit the fibres with each other, or at least to diminish the passage, and prevent the descent of any thing into it from the belly. In the most frequently thick and radical and perfect cure, in those of mature ages, or whose ruptures are of long standing, the entrance into the lig is large, and the neck of the gut, and firmer; therefore the compression and drawing of the sides of the neck are more difficult, though they are sometimes sufficiently contracted to hinder the falling down of any thing from the abdomen. But in very ancient people, and very old ruptures, this union is still more improbable, and therefore a truss, the part of which serves to keep the parts in their proper place, can hardly ever be laid aside.

Intestinal ruptures are in themselves more hazardous than the omental; and this hazard arises from the stricture and the functions of the parts concerned; which are incapable of bearing any considerable degree of inflammation, and which perform offices, such as digestion, propulsion of the chyle into and through the lacteals, and exhalation

expulsion of the feces, necessary to the existence of the animal.

The female *hernia*, when recent, has much the same appearance as the *hernia inguinalis* in man; and when more of the gut or canal is thrust down than the groin can conveniently contain, it pushes down into one of the labia pudendi, and sometimes forms a tumor of considerable size. When the *hernia* of women are easily reducible, they give little pain, and generally return into the belly, when they lie in a supine posture. The same kind of truss is necessary for women, as for men.

For the method of treatment in the more dangerous stages of this disorder, see the preceding article.

HERNIA intestinale. See ENTEROCÆLE, and the preceding articles.

HERNIA lachrymalis. See ANGIOLOPS, ANCHILOPS, and FISTULA lachrymalis.

HERNIA omentalis. See EPILOCELE and *HERNIA inguinalis*.

HERNIA ovaria, is occasioned by the descent of the ovaria through the tendinous opening of the oblique muscles into the groin. Mr. Pott mentions a remarkable case of this kind, in which the ovaria were taken away, by making a ligature on the membranous bag containing them, just below the tendon, and cutting them off. The woman on whom this operation was performed, became thinner and more muscular; her breath, which before was large, diminished, and in great measure disappeared, and her menses ceased; but she enjoyed good health after the operation.

HERNIA scrotalis. See OCHLOCELE and *HERNIA inguinalis*.

HERNIA vaginalis, is a tumor of the vagina, formed by the descent of the intestines, and their pressure on the peritonæum, between the rectum, and the posterior part of the uterus.

HERNIA varicosa, called also *CHYLOCELE*, is a varicose distention of the spermatic vein, attended with pain, and occasionally with a wasting of the testicle. Frequent bleeding, exercise, and attenuating medicines, may be recommended for the prevention of this disease; and the pain of the back that attends it may be relieved by suspension of the testum.

HERNIA omphala. See PNEUMATOCELE.

HERNIA ventralis, is a tumor which appears almost in any part of the belly; but is most frequently found in or between the recti muscles, either above or below the navel. The protruded parts should be reduced, and kept in their place by a proper bandage.

HERNIA vulvæ urinaria. See *HERNIA cystica*.

HERNIA umbilicalis. See OMPHALOCELE and EROMPHALUS.

HERNIAL sac, is formed by a portion of the peritonæum, thrust before the descending part in a rupture, though some have erroneously imagined, that it is produced by mere pressure of the common cellular membrane; and is larger or smaller, according to the quantity of its contents. This sac is at first small and thin, and ischion descends lower than the groin at first, except in congenial *hernia*, but by degrees it extends itself into the scrotum, and as it enlarges in length, its texture becomes firmer and stronger, till in old age, or old ruptures, it is found of very considerable thickness. Mr. Pott apprehends, that this sac is incapable of returning back into the abdomen, after it has been fairly pushed out through the aperture in the tendon. It is now generally acknowledged, that to whatever size the *hernial* sac may be extended, and however large its contents may be, it is merely dilated, and hardly ever burst or broken. See *HERNIA incarcerata*, and *HERNIA inguinalis*.

See on the subject of the preceding articles, Pott's Chirurgical Works, vol. ii. and vol. iii. Heister's Surgery, part ii. Sharp's Operations, &c.

HERNARIA, in Botany. See RUPTURE-WEED.

HERNSHAW, or **HERNARY**, a place where herons breed.

HERO, in the *Ancient Theology*, and *Mythology*, a great and illustrious person, of mortal nature, though by the populace supposed to partake of immortality, and after his death, placed by them among the number of the gods. The word is formed of the Latin *heros*, and that of the Greek *ἥρως*, *heros*, *dem-god*. St. Augustine, De Civit. Dei, lib. x. observes, that it is highly probable, that some one of Juno's sons was originally called by this name; that goddess being called in Greek *Ἥρα*; or it may be, that great men were distinguished by this appellation, in allusion to the opinion of the ancients, that virtuous persons, after their death, inhabit the wide expanse of the air, which is Juno's province. Indore inclines to think, that *heros* were thus called *quasi heros*, *virtuosi*, persons of superior merit, and worthy of heaven. Plato derives the word from the Greek *ἥρως*, *heros*, as intimating the *heros* to have risen from the copulation of

a god with a mortal woman; or of a goddess with a man. Others derive the name from the Greek *ἥρως*, *heros*, *to speak*; the *heros* being persons who, by their eloquence, led the people at their pleasure. Others, lastly, derive it from the Greek *ἥρως*, *heros*, *earthly* the *heros*, on their principle, being the *dei terrestres*, or gods of the earth.

Heros were, properly, persons partly of divine, and partly of human extraction; being produced between a deity and a mortal; as Achilles, who was the son of the goddess Thetis, by Pelæus; and Hercules, who was the son of Jupiter, by Alcmena.

A *heros*, then, coincides with what we otherwise call a *dem-god*; accordingly, Lucian defines a *heros* to be a medium between a god and a man; or rather, a composition of both.

The Greeks erected columns and other monuments over the tombs of their *heros*, and established a kind of worship in honour of the names both of their *heros* and heroines. The Romans also raised statues in honour of their *heros*; but there were six of their *heros* of a superior order, and who were supposed to be admitted into the community of the twelve great gods: these were Hercules, Esculus, Esculapius, Romulus, Castor, and Pollux. Writers have distinguished between the worship which the ancients paid to their *heros*, and that offered to their gods. The latter, it is said, consisted of sacrifices and libations; the former was only a kind of funeral honour, in which they celebrated their exploits, concluding the rehearsal with feasts.

HERO is also used in a more extensive sense, for a great, illustrious, and extraordinary personage; particularly in respect of valour, courage, intrepidity, and other military virtues.

F. Bonhours makes this distinction between a great man and a *heros*, that the latter is more daring, fierce, and enterprising; and the former more prudent, thoughtful, and reserved. In this sense we properly say, Alexander was a *heros*; Julius Cæsar a great man.

HEAD of a poem or romance, is the principal personage, or he who has the chief part to act.

Thus the *heros* of the *Iliad* is Achilles; of the *Odyssey*, Ulysses; of the *Æneid*, Æneas; of Tasso's *Jerusalem*, Godfrey of Bulloign; of Milton's *Paradise Lost*, Adam; though Mr. Dryden will have the devil to be Milton's *heros*, because he gets the better of Adam, and drives him out of Paradise.

The character of Achilles is the inexorable wrath of a haughty, valiant, unjust, and revengeful prince; that of Ulysses, is the wise and prudent dissimulation of a courageous king, whose constancy nothing could shake; that of Æneas, is piety, goodness, gentleness, good-nature, and humanity, sustained, like the others, with an invincible courage.

Many of the critics find fault with the *heros* of the *Æneid*; they say he is too sensible and delicate; and wants the fire, firmness, and uncontrollable spirit, remarkable in the *heros* of the *Iliad*. Piety, tenderness, and submission to the gods, are the virtues of the middle class of mankind; they do not strike and command enough for a *heros*, who is to be the instrument of such notable exploits. St. Evremont looks on Æneas as fitter to have been the founder of a religious order than of an empire. F. Boiss defends Virgil's *heros*, or at least Virgil, with admirable address. Æneas's character, he observes, was not to be formed on the model, either of Achilles, or Ulysses, nor to be of the same kind with them; as the fable and the design of the *Æneid* was very different from those of the *Iliad* and *Odyssey*.

What Virgil had in view was, to make the Romans receive a new kind of government, and a new master; this matter, then, must have all the qualities requisite for the founder of a state, and all the virtues which make a prince beloved. The violence of Achilles was, of consequence, precluded; and so was the dissimulation of Ulysses; that being a quality which renders a man suspected, not beloved.

Virgil was restrained in his choice; his *heros* was to be of the genius of Augustus; and the poet was in the condition of a painter, who is obliged to accommodate a piece of history to the model of a face that is given him. The character of Homer's two *heros*, as being directly opposite to his design, he has thrown upon Turnus and Mezentius, who are the counterparts to his *heros*.

It is disputed among the critics, whether it be necessarily required, that the *heros* of an epic poem be a good and virtuous man? F. Boiss maintains the negative; between a *heros* in morality, and a *heros* in poetry, the same distinction is to be made, as between moral and poetical good-nature. Hence as the manners of Achilles, and Mezentius, are poetically as good as those of Ulysses, and Æneas, so those two cruel and unjust men are as regular poetical *heros*, as the two just, wife, and good men.

Aristotle, indeed, represents the *heroic* virtue, as a virtue more than human; and of consequence, *heroes*, as divine persons, when on the excellency of their nature takes above our class, but this he says only in his books of morality; in his Poetics he speaks another language. The prime person of a poem, whom he calls the *hero*, he there observes, must neither be good nor bad, but between both: he must not be either superior to the generality of mankind, by his virtue and justice; nor inferior to them, by his crimes and wickedness; the moral and epic *heroes*, therefore, even on Aristotle's principles, have nothing in common with each other; the one must be raised above mankind, and the other must not be on a level with the most perfect of men.

In effect, reason, the nature of the poem, which is to be a fable, the practice of Homer, and the rules of Aristotle and Horace, all agree, that so far is it from being necessary, that the *hero* of an epopee be a perfect, faultless man, that it is not necessary he be an honest man; and that it is no ways irregular to make him as perfidious as Ixion, as unmanly as Macheas, or as brutal as Achilles.

It is another subject of controversy, among the critics, whether the catastrophe, or conclusion of the action, is necessarily to leave the *hero* happy, and at ease; or whether it be allowable to leave him unhappy.

The general practice of the *heroic* poets stands for the first. We have scarce one example of a *hero* who is overcome, and remains unhappy; excepting Adam in Milton. In tragedy, the tale is different: unhappy catastrophes, according to Aristotle, are preferable to happy ones, and were always much better received among the ancients. The tragic scene is the throne of the passions; and terror and pity are there to rule in a peculiar manner: now these passions arise the most mutually from unhappy events; and the audience, quitting the theatre full of the misfortune wherewith the piece was closed, prefer the concern much longer, and feel more forcible effects from it, than if their tears had been wiped away; and their sighs smothered, in the satisfaction of a more happy peripeteia.

But these reasons have no place in the epopee; which is not intended to much to affect the passions, as to remove ill habits. But (it is true, withal, that the epopee does not exclude all unhappy conclusions; the nature of epic fable is such as admit equally of good and bad persons for the prime parts), the unhappy adventure of a hero unjustly devoured by a wolf, is a subject every way as instructive, and as regular, as the generosity of a lion, who lets himself be disarmed of his rage by the innocence of the lamb.

It is true, if the poet proposed his *hero* as a pattern of perfection for imitation, the misfortunes falling on him would suit very ill with the design; but this was, doubtless, the furthest thing from the intentions of the great masters of the epopee above mentioned. The only reason, perhaps, that can be given for the uniform practice of the poets in this respect, is, that an epic poem containing an action of much more extent than that of a tragic poem, the reader would not be so well satisfied, if, after so many labours and difficulties as the *hero* is brought to struggle with, he should not at last be brought off, but perish miserably. There is something, no doubt, great and good in the *hero*, which, in the course of the poem, makes us concerned for him; so that, after so long an acquaintance, we cannot leave him miserably without some anxiety; which it is not the final business of the poet to raise.

HERODIANS, a sect among the Jews, at the time of Jesus Christ, mentioned by St. Matthew, xxii. 16. and St. Mark, iii. 6. and xii. 13.

The critics and commentators on the New Testament, are very much divided with regard to the *Herodians*; some making them to be a political party, and others a religious sect. The former opinion is favoured by the author of the Syriac version, who calls them the domestics of Herod, and also by Josephus; having passed them over in silence, though he professes to give an account of the several religious sects of the Jews. The latter opinion is countenanced by our Lord's caution against the leaven of Herod, which implies, that the *Herodians* were distinguished from the other Jews by some doctrinal tenet.

St. Jerome, in his Dialogue against the Luciferians, takes the name to have been given to such as owned Herod for the Messiah; and Tertullian, Epiphanius, Chrysostom, and Theophylact, among the societas and Glosius, and other moderns, are of the same sentiment. But the same St. Jerome, in his comment on St. Matthew, treats the same opinion as ridiculous; and maintains, that the Pharisees gave this appellation, by way of derision, to Herod's soldiers, who paid tribute to the Romans; agree-

ably to which, the Syriac interpreters render the word by the *domestics of Herod*; i. e. his courtiers.

M. Simon, in his notes on the twenty-second chapter of Matthew, advances a more probable opinion. The name *Herodian*, he imagines to have been given to such as adhered to Herod's party and interest, and were for preserving the government in his family; about which there were, at that time, great divisions among the Jews.

F. Hardouin will have the *Herodians* and Sadducees to have been the same.

Dr. Prideaux is of opinion that they derived their name from Herod the Great, and that they were distinguished from the other Jews by their concurrence with Herod's scheme of subducing himself and his dominions to the Romans, and likewise by complying with many of their heathen usages and customs. This symbolizing with idolatry upon views of interest and worldly policy, was probably that leaven of Herod, against which our Saviour cautioned his disciples. It is farther probable that they were chiefly of the sect of Sadducees; because the leaven of Herod is also denominated the leaven of the Sadducees.

Wid. Conn. part ii. book v. tab. fin.

HERODIUS *avis*, in *Natural History*, a name given by Aldrovand; and some others, to the chrysolite, or golden eagle.

HEROIC, something belonging to a hero, or heroine.

Thus we say, *heroic actions*, *heroic virtue*, *heroic style*, *heroic verses*, *heroic poet*, *heroic age*, &c.

HEROIC AGE, is that age or period of the world, wherein the *heroes*, or those called by the poets the *children of the gods*, are supposed to have lived.

The *heroic age* coincides with the fabulous AGE.

HEROIC POEM is that which undertakes to describe some extraordinary action, or enterprize.

Homer, Virgil, Statius, Lucretius, Tasso, Camoens, Milton, and Voltaire, have composed *heroic poems*.

In this sense, *heroic poem* coincides with *EPIC poem*.

HEROIC VERSE, is that wherein *heroic poems* are usually composed; or, it is that proper for such poems.

In the Greek and Latin, hexameter verses are peculiarly denominated *heroic verses*, as being alone used by Homer, Virgil, &c.

Alexandrine verses of twelve syllables, were formerly called *heroic verses*, as being supposed the only verse proper for *heroic poetry*; but later writers use verses of ten syllables.

HEROINE, **HEROINA**, or **HEROIN**, a woman that has the qualities and virtues of a *HERO*; or that has done some heroic action.

HERON, *Ardea*, in *Ornithology*, the name of a large genus of birds, the distinguishing character of which is, by Mr. Ray, fixed in their intelligence, they having only one instinctive scream, or blind cry, as is the custom of nature in quail-geese, most other birds having two.

In the Linnæan system this is a genus of the grallæ, distinguished by a long, straight, pointed bill, with furrows from the nostrils to the end, linear nostrils, and feet with four toes. To this genus belong the *ARDEOLA*, *BITTERN*, *COCOT*, *CRANE*, the *GALLA GIBBOSA*, or small white *heron*, the *GAZZA*, or greater white *heron*, the *SOCO*, the *STORK*, *night-heron*, &c.

The common *heron*, or *ardea major* of Linnaeus, has a small body, always lean; and covered with a very thin skin. See Tab. II. *Birds*, fig. 18. It builds in trees, and sometimes in high cliffs over the sea; forms its nest of sticks lined with wool, and in the month of February lays five or six large eggs of a pale green colour. This bird was formerly much esteemed as a food; it is remarkable for long-lived, sometimes exceeding even fifty years. The male is a very elegant bird; its forehead and crown, and upper part of the neck, are white; the head is adorned with a pendent crest of long black feathers; the covers of the wings are of a light grey colour; the fore part of the neck is white, spotted with a double row of black; the feathers are white, long, narrow, and unwebbed, and the scapulars are of the same texture, of a grey colour, streaked with white; beneath the wings there is a set of black feathers, which are very long and forked, and were formerly used as ornaments to the caps of the knights of the Garter; the breast, belly, and thighs, are white; the list being dashed with yellow; the tail is composed of twelve short cinereous feathers; the legs are of a dirty green, the claws short, and the inner edge of the middle claw softly serrated. The head of the female, which was formerly supposed to be a distinct species, is grey; instead of a crest, it has only a short plume; the scapulars are grey and webbed, and the feet grey. The female of this bird is a very great devourer of fish, and does more mischief to a pond than even an otter. People who have kept *herons*, have had the curiosity to number out the fish they fed them with into a tub of water, and counting them again afterwards, it has been found that they

they will eat fifty moderate sized dace and perch in a day. It has been found that in carp ponds, visited by this bird, one *heron* will eat up a thousand stone carp in a year, and will hunt them to close as to let very few escape. The readiest method of destroying this mischievous bird, is by fishing for him in the manner of pike, with a baited hook. When the haunt of the *heron* is found out, three or four small roach or dace are to be procured, and each of them is to be baited on a wire, with a strong hook at the end, entering the wire just under the gills, and letting it run just under the skin to the tail, the fish will live in this manner five or six days, which is a very essential thing; for if it be dead, the *heron* will not touch it. A strong line is then to be prepared of silk and wire twisted together, and is to be about two yards long; tie this to the wire that holds the hook, and to the other end of it there is to be tied a stone of about a pound weight; let three or four of these baits be sunk in different shallow parts of the pond, and in a night or two's time, the *heron* will not fail of being taken by one or other of them.

When hawking was more in use, and laws were enacted for the preservation of the species, the *heron* afforded a great deal of sport to the people who loved that diversion.

There is but very little art in this fight of the hawk; but as both the birds are large and courageous, the fight is finer than in the flight of smaller birds that make no resistance. At the beginning of March the *herons* begin to make their passage; if, therefore, you will adapt your hawks to the *heron*, they must at this time be used to fly at the rivers, and about waters; and they must be fed with light meats; then the hawk is to be entered at the game by getting a living *heron*, and cutting its wings, or disabling it in such a manner that it cannot fly; then it is to be set on the ground, and the hawk unhooded and let go at her. If the hawk seize the *heron*, the falconer must run in to her assistance, and kill the *heron*, giving the hawk her reward, the heart, and letting her stand over the opened breast, and feed on other parts of the entrails; then let her be hooded; and afterwards the bird is to be brought about the head, and the hawk taught to come and feed on it out of the falconer's hand.

When the hawk is thus fairly entered, another live *heron* is to be procured, and let off in an open field undisturbed. As soon as the *heron* is risen to a considerable height in the air, the hawk is to be let out after her; if the hawk close with her, and bring her wings and legs, the falconer is to run up to her assistance, and flicking the *heron's* bill in the ground, and breaking her wings and legs, the hawk is to be left to feed and plume upon her. When she is thus well managed, she may be taken to the waters, and let at a wild *heron*, in the following manner.

When a *heron* is found, the falconer is to get as high her as he can, going under the wind with his hawk, which must be a gersalcon, or jorkin, with a haggard falcon for the driver. Thus having the birds loose, as soon as ever the *heron* is up, let off the drivers, which makes up to her, and causes her to work in the wind; then let go the hawks that are to fly at her; but when they have worked about the *heron* that they come through her, they will make her come to siege. When they have got her down, the falconer must make up to them as quick as possible, and assist them by breaking her legs and wings, and thrusting her bill into the ground. For this flight of the hawk there should always be a dog trained up to the sport, whose business it is to come up and kill the *heron* the moment that he sees her fall.

If the hawk cannot bring her down, or gives over the flight, then give her a train *heron* or two, in a proper place, before she is trusted at a wild *heron* again, otherwise she will be disheartened and spoiled.

A *heron* at siege is one standing at the water-side watching for prey.

HEROS *cosmopolitanus*, the *hero* of *cosmopolitanus*, an affected name given by Paracelsus to the spirit of sea-salt; a menstruum he was particularly fond of, and which seems to have been one great ingredient in his alchemical.

HERPES, *verruca*, in *Medicina*, a cutaneous heat, or inflammation, attended with a roughness of the skin, and the eruption of a number of little pustules spreading every way.

The word is formed of the Greek *herpein*, *to crawl*, *propter*, *quia*; because the eruptions creep from place to place.

There are divers kinds of this distemper; as,

HERPES, *millaria*. This is an assemblage of innumerable little pustules, under the envelope, of the size of millet-seeds; popularly called the *SHINGLES*.

HERPES, *similis*, is a single pustule, or two, rising chiefly on the face, of a whitish or yellowish colour, pointed, and with an inflamed base. These dry away, of their own accord, upon letting out the drop of pus contained in them.

A third species of *herpes* is what we otherwise call *scrophulous*, and, in English, a *cutter*, or *ringworm*.

HERPES *cutaneus* is of a more cutaneous kind; the pustules are bulky, and attended with an itching; and ulcerate the parts on which they rise.

HERPES *ferax*. See *LEPROSUS*.

HERRING, *Heringus*, in *Ichthyologia*, a species of the *clupea*. The characters by which this fish is distinguished from the rest which approach to it in shape, and which are thence called *heringiformes*, are these: its usual length is seven or eight inches, though it sometimes grows to a foot; its head is flat, and its mouth placed upwards; the colour of the back and sides is green, varied with blue, and that of the belly silvery; the scales are large and round; it is not at all spotted; and its belly is sharply carinated, but the ridge is quite smooth, and not in the least serrated; its side-lines are small, and scarce distinguishable; the lower jaw is longer and more prominent than the upper; its gills are four in number, as in other fishes, but their fibres are remarkably long, and open very wide, so that the *herries* almost instantly dies when taken out of the water; it has one fin on its back, which consists of about seventeen rays, and is in the midway between the head and tail; the two ventral fins have nine rays, the pectoral seventeen, the anal fourteen, and the tail is forked.

The name *hering* is derived from the German *her*, an *army*, which expresses their number, when they migrate into our seas. *Herrings* are found in great plenty from the highest northern latitudes as low as the northern coast of France. They are also met with in vast shoals on the coast of America, as low as Carolina: they are found also in the sea of Kamtschatka, and possibly reach Japan: but their winter rendezvous is within the arctic circle, whither they retire after spawning, and where they are provided with plenty of insect food. For an account of the remarkable migration of *herrings*, and the history of the fishery, &c. see *Herring* *PISCARY*.

They are in full roe at the end of June, and continue in perfection till the beginning of winter, when they begin to deposit their spawn.

There are divers names given to preserved herrings, according to the different manners wherein they are ordered: as,

1. *Sea-fisks*. These are such as are caught all the fishing season, and are but once packed. A barrel of these holds six or eight hundred; eight barrels go to the tun, by law; a hundred of *herrings* is so be a hundred and twenty; a salt is ten thousand; and they commonly reckon fourteen barrels to the salt.

There are others, repacked on shore, called *repacked herrings*, seventeen barrels of sea-fisks commonly make from twelve to fourteen of repacked *herrings*.

The manner of repacking them is, to take out the *herrings*, wash them out in their own pickle, and lay them orderly in a fresh barrel; these have no salt put to them, but are close packed, and headed up by a sworn cooper, with pickle, when the barrel is full. The pickle is brine; so strong, as that the *herries* will swim in it.

2. *Summer*. These are such as the Dutch chaffers, or divers, catch from June to the fifteenth of July. These are sold away in sea-fisks, to be spent presently, in regard of their fatness; because they will not endure repacking. They go one with another, full and rotten; but the repacked *herrings* are sorted, the full *herries* by themselves.

3. *The flotten and salt herrings* by themselves; the barrel whereof is to be marked distinctly.

4. *Cross herrings*, which are such as are caught after the fourteenth of September. These are cured with that kind of salt called salt upon salt, and are carefully sorted out, all full *herries*, and used in the repacking.

5. *Cured herrings*. These serve to make red *herrings*, being such as are taken in the Yarmouth-fleet, from the end of August to the middle of October; provided they can be carried ashore within a week, more or less, after they are taken. These are never gipped, but rowed in fish, for the better preserving of them, till they can be brought on shore; and such as are kept to make red *herries*, are washed in great vats in fresh water before they are hung up in the *herries*-hang, or red-drying houses.

As for the manner of *salting herrings*. The nets being holed on board, the fishes are taken out, and put into the warbucks, which stand on one side of the vessels. When all the nets are thus unloaded, one fills the gippers baskets. The gippers cut their throats, take out their guts, and sling out the full *herries* into one basket, and the thotten into another. One man takes the full basket when they are gipped, and carries them to the rowen-back, wherein there is salt. One boy rows and stirs them about in the salt, and another takes them, thus rowed, and carries them in baskets to the packers. Four men

pack the *herrings* into one barrel, and lay them, one by one, straight and even; and another man, when the barrel is full, takes it from the packers. It is left to stand a day, or more, open to settle, that the salt may melt and dissolve to pickle; after which it is filled up, and the barrel headed. The pickle is to be strong enough to sustain a *herring*; otherwise the fish decay in it. See *Herring Fishery*.

It is unlawful to buy or sell *herrings* at sea, before the fishermen come into the haven, and the cable of the ship be drawn to the land. 31 Edw. III. stat. 2. No *herring* shall be sold in any vessel; but where the barrel contains thirty-two gallons, and half-barrel and firkin accordingly; and they must be well packed, of one time's packing and fishing, and be as good at the middle as the ends, on the pain of forfeiting 3s. 4d. a barrel, &c. by stat. 22 Edw. IV. cap. 2. The vessels for *herrings* are to be marked with the quantity, and place where packed, and packers to be appointed and sworn in all fishing ports, &c. under the penalty of 100s. stat. 15 Car. II. cap. 16. *Fresh herrings* considered as a food, are said to be very good aliment, if used moderately; but if taken in quantities disproportionate to the powers of digestion, they produce a putrefaction in the stomach of the alkaline kind, and are attended with all the bad consequences of highly scalefent aliment: but pickled *herrings* are very bad aliment, the flesh being rendered hard, and scarcely digestible by the vital powers: these, however, are less injurious than those which are salted and dried.

The parts of the *herring* used in medicine, are the vesicles called *anims*, and the entire fish. The *anims* are said to excite urine taken internally. Salted *herrings* are sometimes applied to the soles of the feet in fevers, with an intent to derive the humours from the head, and mitigate the febrile heat. The pickle of *herrings* is used in dysentery, for pains in the hips; and a droply; externally applied, it modifies ferid ulcers, stops the progress of a gangrene, and dissipates stromous swellings. It is also of service in a quinsy, if the parts affected are anointed with this and honey mixed together.

HERRING BUSH, a vessel used in the *herring* fishery. See *Buss* and *FISHERY*.

HERRING COB is a young *herring*. See *HERRING FISHERY*.

HERRING FISHERY. See *Herring Fishery*.

HERRING GULL, in Ornithology, the name of a bird of the larus kind, called by authors *larus cinerascens maximus*, or the great grey gull, and by Linnaeus the *larus fusca*. It is of the size of our common duck; its beak is yellow, and is narrow, and two fingers breadth long, a little hooked at the end, and has on the lower chap an orange-coloured spot; the edges of the eye-lids are red; the head, neck, and tail, white; the back and coverts of the wings ash-coloured; the upper part of the five first quill-feathers are black, marked with a white spot near their end; the legs are of a pale flesh colour; it feeds on *herrings* and other fish, and is a very voracious bird. It breeds on the ledges of rocks that hang over the sea Ray and Pennant.

HERRING RICE, a composition in money, formerly paid in lieu of a certain quantity of *herrings* for the provision of a religious house.

HERRIOT. See *HARLOT*.

HERRISON, in Fortification, is a beam or barrier made of one strong piece of wood, full of iron spikes. It is commonly supported in the middle, and turns upon a pivot, or axis. It is used for securing any passages, which are to be often opened and shut.

HERNHUTTERS, in Ecclesiastical History, the name of a fanatical sect, called also *Moravians*, which sprung up in Upper Lusatia towards the beginning of this century. This sect was founded by Nicholas Lewis count of Zinzendorf; and to his activity and zeal the progress of it is to be ascribed. According to the account which he gives of himself, he had formed a design, when only ten years old, of collecting a small society of *believers*, who should altogether employ themselves in exercises of devotion, under his direction. Accordingly, when he became of age, in the year 1721, he settled at Bertholdsdorf, a village in Upper Lusatia, where he was soon joined by a number of protestants from Moravia; so that in a few years Bertholdsdorf became a considerable village, having an orphan-house, and other public buildings. In 1728, thirty-four new houses were erected; and in 1732 the number of inhabitants amounted to six hundred. From the name of a hill in the neighbourhood of this village, called the *Hartberg*, these colonists gave their dwelling place the appellation of *Hut der Herren*, and afterwards *Herrnhut*, signifying the guard or protection of the Lord, whence arose the denomination of their sect. As their number increased, Zinzendorf established a peculiar discipline, dividing his adherents into different classes of married men, married women, widowers, widows, maids, bachelors, and children; each class being under

the inspection of a director, chosen by its members; and the classes are also subject to the superintendence of an elder, co-elder, and vice-elder. Particular attention was paid by these several classes to the instruction of youth; and as a great part of their worship consisted in singing, they pretended that children were instructed in their religion by hymns. There are some persons of both sexes appointed by rotation to pray for the society, who are admonished of their duty by an inward feeling; and they pretend to determine the discipline in particular cases by calling lots. All matrimonial contracts are subject to the direction and approbation of the elders. This sect professed its first establishment to belong to the Lutheran church; but count Zinzendorf, for the greater credit of this new society, afterwards pretended that it was a revival of the ancient Moravian church, or Bohemian brethren, who were converted from popery by John Hus. But this seems to have been a mere pretence. Such was the origin of a sect, which in process of time became very considerable and extensive, and which adopted tenets and practices as unjustifiable as they are singular. Zinzendorf was denounced the trustee and guardian of the brethren; in 1737 he was consecrated bishop of this sect, a dignity which he resigned in 1740. Towards the close of the year 1744, he was de-nominated minister plenipotentiary and economist; and it was enacted that nothing of importance should be done without his consent; and he afterwards styled himself the lord advocate of the *united fratrum*. Zinzendorf has travelled in person all over Europe, and been twice in America; and he has also sent missionaries almost throughout the known world. It would be endless to recount the numberless attempts which this sect has made use of to establish its own authority, and to extend the interest of his party. According to his own account, published in 1749, the society had almost a thousand labourers dispersed all over the world, who preached in fourteen languages, and ninety-eight different establishments, among which are called, that have twenty, fifty, or ninety apartments. How far this account is justified by fact, we cannot pretend to determine; but it is certain, that the decline of this sect has been no less legal and rapid than its progress. With regard to the tenets of the *Herrnhuters*, it may be observed, that at their first rise they professed to admit the confession of Augsburg, and count Zinzendorf has always referred to this confession, as the standard of his doctrine. However it is well known, that he has advanced very pernicious notions, and recommended very unwarrantable practices; such notions and practices as disfigure the sacred truths of the Gospel, and sap the foundations of morality. The count himself speaks in very derogating terms of the Scripture, and expressly asserts, that the reading of the Scripture appears to him to be more dangerous than useful to the society. To avoid idolatry, he says, people ought to be taken from the Father and Holy Ghost, and conducted to Christ, with whom alone we have to do. The Holy Ghost is called by the *Herrnhuters* the eternal wife of God, the mother of Christ, the mother of the faithful, and of the church. The language of their devotion approaches to obscenity; and the ideas excited by words such as no chaste mind can entertain. In some of their hymns of devotion, they have been charged with making their direct addresses to what was formerly adored in Lampacrus. The conjugal act is a piece of fecerity, in which the male represents Christ the husband of souls, and the female the church; and they have actually appointed such ceremonies, in the celebration of marriage, as suppose them to have entirely given up all sense of shame. Count Zinzendorf expressly declares, that the law is not a rule of life to a believer; that the moral law belongs only to the Jews; and that a converted person cannot be in a full light. It has been said, that no example can be found of a fanaticism more extravagant, and a mysticism more gross and scandalous than those of the *Herrnhuters*; and that it would be impossible to multiply specimens of their creed or devotion, extracted from the sermons and writings of their founder, without offending the chaste reader. Those whose curiosity leads them to wish for further information, may consult Moheim's Ecc. Hist. vol. 7. p. 85, note (1). Warburton's Doctrine of Grace, vol. II. p. 153 and Rimsa's Candid Narrative of the Rise and Progress of the *Herrnhuters*, commonly called *Moravians*, or *Unitas Fratrum*, &c. 1753, and Supplement, &c. published in 1755. In justice to those, who disavow the opinions and practices charged upon the *Herrnhuters*, an account of this sect, extracted from their writings, is given under *Unitas Fratrum*.

HERSE, in Fortification, a lattice, or portucullis, in form of a harrow, beset with iron spikes.

The word *herse* is French, and literally signifies *harrow*; being formed of the Latin *herpes*, or *herpes*, which denote the same.

It is usually hung by a rope fastened to a moulinet; to be cut, in case of surprise, or when the first gate is broken with a petard; that the *herse* may fall, and stop up the passage of the gate, or entrance of the fortress. The *herse* is otherwise called a *forge*, or *catapult*; and when it consists of straight stakes, without any cross-pieces, it is called *ORCUES*.

HERSE is also a harrow, which the besieged, for want of chevaux de frize, lay either in the way, or in breaches, with the points up, to incommode the march as well of the horse as the infantry.

HERSILLON, in the *Military Art*, a sort of plank, or beam, ten or twelve feet long, whose two sides are strewed full of spikes, or nails, to incommode the march of the infantry or cavalry.

The word is a diminutive of *herse*; the *hersillon* doing the office of a little *herse*.

HERSIPHORIA. See **ARRHIPHORIA**.

HERTHA, or **HERTHOS**, in *Mythology*, a deity worshipped by the ancient Germans. This is mentioned by Tacitus, in his book *De Moribus Germanorum*, cap. 40. Vollius conjectures that this goddess was Cybele; but she was more probably Terra, or the earth; because the Germans still use the word *heri* for the earth, whence also the English *earth*. Some have supposed that *STONEHENGE* was a temple consecrated to the goddess *Hertha*.

HERTHAMAN, in the *Materia Medica*, a name given by Avicenna and Serapion to the grain called *TRIA*, used much in medicine in their times, and supposed to be of a middle nature between wheat and barley.

HESTER, **HESTERUS**, in *Astronomy*, the evening star; an appellation given to Venus when she follows, or sets after the sun.

The word is formed of the Greek *ἑσπερος*, and is supposed to have been originally the proper name of a man, brother of Atlas, and father of the **HESTERIDES**. Diodorus, lib. ii. relates, that *ἑσπερος* having ascended to the top of mount Atlas, the better to observe and contemplate the stars, never returned more; and that hence he was fabled to have been changed into this star.

HESTERIDES, *ἑσπερίδες*, in the *Antient Mythology*, were the daughters of *Heper*, or *Heperus*, the brother of Atlas. According to Diodorus, *Heperus* and Atlas were two brothers, who possessed great riches in the western parts of Africa. *Heperus* had a daughter called *Heperia*, who married her uncle Atlas, and from this marriage proceeded seven daughters, called *Heperides*, from the name of their mother, and *Atlantides*, from that of their father. According to the poets, the *Heperides* were three in number, *Ægle*, *Arethusa*, and *Hepertheia*. Hesiod, in his *Theogony*, makes them the daughters of *Nyx*, *Night*, and seats them in the same place with the *Gorgons*; viz. at the extremities of the west, near mount Atlas: it is on that account he makes them the daughters of *Night*, because the sun sets there. The *Heperides* are represented by the ancients as having the keeping of certain golden apples, on the other side the ocean. And the poets give them a dragon to watch the garden where the fruit grows: this dragon they tell us Hercules slew, and carried off the apples.

Pliny and Solinus will have the dragon to be no other than an arm of the sea, wherewith the garden was encompassed, and which defended the entrance thereof. And Varro supposes, that the golden apples were nothing but sheep. Others, with more probability, say they were oranges.

The gardens of the **HESTERIDES**, *Heperidum horti*, or *horti*. *Heperidum*, are placed by some authors at Laraca, a city of *Fæz*; by others, at Bernich, a city of *Barca*, which rallies better with the fable. Others take the province of *Susa*, in Morocco, for the island wherein the garden was seated. And lastly, Rudbeck places the Fortunate Islands, and the gardens of the *Heperides*, in Sweden.

HEPERIS, in *Botany*. See *DAME'S VIOLET*.

HESSIAN bellows. See **BELLOWS**.

HESYCHASTES, *Ἡσυχαστῆς*, a person who keeps himself vacant, and at leisure, to attend the better, and with the less interruption, to the contemplation of divine things.

The word is Greek *ἡσυχάζω*, formed of *ἡσυχία*, *quietus*, *quiet indulgence*, a derivative of *ἡσυχία*, *quiet*; so that *hesychastes*, in Greek, answers to the literal sense of *quietist* in English.

The name was chiefly used by the ancients for such among the monks as did not employ themselves in any labour of the hands, but renounced all bodily action, to resign themselves wholly to prayer and meditation.

HESYCIUS, in *Natural History*, the name of a fly of the carnivorous kind, often found preying on the bodies of other flies, beetles, &c. and of serpents; whence it has been called also *ophioborus*. Its wings are of a shining pale yellow, or the colour of polished brats; whence it has also been called by some *CHALCOMULA*.

VOL. II. N° 171.

HETERIARCH, *Ἡτεριάρχη*, in *Antiquity*, an officer in the Greek empire, whereof there were two species; the one called simply *heteriarch*; and the other, *great heteriarch*, who had the direction of the former.

The word is Greek *ἑτεριάρχης*, formed of the Greek *ἑτερος*, *foreign*, *alien*, and *αρχή*, *imperium*, *command*. Their principal function was to command the troops of the allies; besides which, they had some other duties in the emperor's court, described by Codin, *De Officiis*, cap. 7. n. 30, 31, 32, 37.

HETEROCLITE, *Ἡτεροκλίτης*, in *Grammar*, an irregular, or anomalous word, which either in declension, conjugation, or regimen, deviates from the ordinary rules of grammar. See **ANOMALOUS**.

The word is Greek *ἑτεροκλίτης*, formed of *ἑτερος*, *alter*, *another*, *different*, and *κλίσις*, *I decline*.

Heteroclitie is more peculiarly applied to nouns, which vary, or are irregular, in point of declension; having fewer cases, numbers, &c. than ordinary; or that are of one declension in one number, and another in another.

We have various sorts of *heteroclitie*, as defective, and redundant *heteroclitie*, &c. Under the class of *heteroclitie*, come *APOTOME*, *DITOTOME*, *MONOTOTOME*, *TRITOTOME*, *TETRATOTOME*, *PENTATOTOME*, &c.

HETERODOX, in *Religious Theology*, something that is contrary to the faith or doctrine established in the true church.

The word is formed of the Greek *ἑτεροδότης*, a compound of *ἑτερος*, *alter*, and *δόξα*, *opinion*.

Thus, we say, a *heterodox* opinion, a *heterodox* divine, &c.

The word stands in opposition to *orthodox*.

HETERODOX, *Ἡτεροδοξία*, in *Botany*, that set of systematical writers on this science, who formed their distributions and classes of the plants on wrong foundations, not on the divisions made by nature in the different structure of the parts of fructification in the different classes, but on the shape of their leaves, or roots; or who ranged them by their common names, according to the letters of the alphabet. Linnæi Fund. Bot. p. 2. See **BOTANY**.

HETERODROMUS *αὐλῆς*, in *Mechanics*, a lever wherein the fulcrum, or point of suspension, is between the weight and the power.

This is what we otherwise call a *lever of the first kind*. Such is that represented *Tab. Mechanicæ*, fig. 1.

This term is used by way of contradistinction to the *HETERODROMUS* *υψέλης*.

HETEROGENEITY, in *Physics*, the quality or disposition which denominates a thing *heterogeneous*.

The word is also used for the *heterogeneous* parts themselves. In which sense, the *heterogeneity* of a body are the same thing with the *impurities* thereof.

Heterogeneity is a term of a very lax signification, and is brought by the chemists to serve almost for every thing they do not understand; so that all disagreement, or inaptitude to mixture between any bodies, is imputed to the *heterogeneity* of their parts.

But so far as the term may be made use of, to convey any distinct signification, it must be by considering natural bodies under different forms, according as they are diversified by figure, bulk, motion, and their more sensible properties; so that those of different forms are *heterogeneous* to one another, and the parts of the same form are homogeneous. Thus the division chemistry makes of bodies into oils, salts, spirits, &c. may be reckoned with respect to one another, *heterogeneous*; though the parts of each division are among themselves homogeneous.

In effect, they are two terms, which serve frequently as a refuge for ignorance; otherwise the common terms of *like* and *unlike* may serve every whit as well. Quincy.

HETEROGENEOUS, or **HETEROGENEAL**, literally imports something of a different nature, or that consists of parts of different, or dissimilar kinds: in opposition to **HOMOGENEOUS**.

The word is Greek, formed of *ἑτερος*, *alter*, *different*, and *γενος*, *genus*, *kind*; q. d. composed of different kinds of parts.

HETEROGENEOUS is particularly applied, in *Mechanics*, to those bodies, whose density is unequal in different parts of their bulk.

Or, *heterogeneous* bodies are such, whose gravities in different parts are not proportionable to the bulks thereof. Bodies equally dense, or solid in every part, or whose gravity is proportionable to their bulk, are said to be *homogeneous*.

HETEROGENEOUS light, is that which consists of parts or rays of different refrangibility, reflexibility, and colour.

HETEROGENEOUS nouns, in *Grammar*. See **NOUM**, **GENDER**, &c.

HETEROGENEOUS numbers. See **NUMBERS**.

HETEROGENEOUS quantities, are those which are of such different kind and consideration, as that one of them, taken any number of times, never equals or exceeds the other.

HETEROGENEOUS solids, are such as have different radical figures; as $\sqrt[3]{x^3}$, $\sqrt[4]{x^4}$, $\sqrt[5]{x^5}$, &c.

How to reduce the *heterogeneous solids* to homogeneous ones, see under the article **SERIES**.

HETEROPHAGI, formed of *hetero*, different, and *phago*, I eat, in *Natural History*, a term used by some authors to express a peculiar class of insects distinguished by their eating many different things; but not feeding on one another, as those do which are of the class of the **STRELOPHAGI**, of which there are a great number of species.

HETEROPOLON, in *Antiquity*. See **AMPHOTEROPOLON**. **HETEROPYCNES**, in *Natural History*, the name of a genus of ferruginous fossils, composed of several coats, including a nucleus of a different substance from themselves, and often loose, and rattling in them. See **DICROCHITA**.

Of this genus there are seven species. Hill's *Fossils*, p. 236.

HETERORHYTHMUS, compounded of *hetero*, and *rhythmus*, a term used by some fanciful writers, for a course of life suitable to the age of those who live in it. The name is also applied to pulses, when they beat variously or irregularly in diastole or rather when a pulse belonging to one age is found in a patient of another.

HETEROSCHI, formed of *hetero*, different, and *schia*, shadow, in *Geography*, a term vulgarly applied to those inhabitants of the earth, whose shadow at noon-fall is always projected the same way, either northward, or southward.

In this sense, the inhabitants of the temperate zones are denominated *heteroschi*. See **ZONA**.

HETEROSCHI, however, in strictness, and according to the origin and reason of the word, is a term of relation, and denotes those inhabitants, whilst, during the whole year, have their noon-tide shadows projected different ways from each other. Thus, we who inhabit the northern temperate zone, are *heteroschi* with regard to those who inhabit the southern temperate zone; and they are *heteroschi* with respect to us.

From this definition it follows, that only the inhabitants of the two temperate zones are *heteroschi*; nor is the word ordinarily applied to any other: though, in reality, there is always one part of the torrid zone, whose inhabitants are *heteroschi* with regard to those of the rest, and with regard to those of one of the temperate zones, except at the time of the solstices. And even at that time, all of the torrid zone are *heteroschi* with regard to those of one of the temperate zones. But as this is variable, and the people of the torrid zone have their shadow now on this, and then on that side, the custom is to call them *amphoschi*, and not *heteroschi*.

HETEROSTROPHE, formed of *hetero* and *stropho*, I turn, an epithet applied to certain shells, the wreaths of which turn a contrary way from those of other shells of the same genera. We have in the *Philosophical Transactions*, N^o cxi an account of two very remarkable snail-shells of this kind.

HETEROUSII, **HETEROUSIIANS**, compounded of *hetero*, and *usii*, *usii*, a sect or branch of Ariani, the followers of Arius, and from him also denominated **ARIANS**. They were called *Heterousii* because they held not that the Son of God was of a substance like, or similar to, that of the Father; which was the doctrine of another branch of Ariani, thence called **HOMOUSIIANS**, *homousii*; but that he was of another substance different from that of the Father.

HEUCHERA, in *Botany*, a genus of the *pentandria digynia* class; the corolla of which consists of five petals, and the fruit is a capsule, containing two cells. Of this genus there is only one species.

HEWHOLE, or, as it is pronounced in some places, the *hew-hole*, a name given by many to the common green wood pecker, from its making holes in trees.

HEXACHORD, compounded of *hex*, six, and *chord*, chord, or string, in the *Ancient Music*, a concord commonly called by the moderns a *hex*.

The *hexachord* is twofold, the *greater* and *lesser*. The *greater hexachord* is composed of two greater tones, two lesser tones, and one greater semitone; which make five intervals.

The *lesser hexachord* consists only of two greater tones, one lesser tone, and two greater semitones.

The proportion of the former, in numbers, is as 3 to 5; and that of the other, as 5 to 8.

In the table inserted under the head **INTERVAL**, we have retained the term *hexachord* to signify the sixth of the Greek scale, which is not a true sixth major, but a comma more, being a tone major above the fifth.

HEXACONTALITHUS, in *Natural History*, the name of a stone described by Pliny, and other of the ancient writers, as being very small, yet showing an almost infinite variety of colours. It seems only another name for the **OPAL**.

HEXAEDRON, or **HEXAHEDRON**, formed of *hex*, six, and *edra*, seat, in *Geometry*, one of the five regular bodies, popularly called a cube.

The figure of the side of a *hexaedron* is in a subtriple ratio to the figure of the diameter of the circumscribed sphere. Hence, the side of the *hexaedron* is to the side of the sphere as $\sqrt[3]{2}$ is to $\sqrt[3]{3}$; and, consequently, it is inconmeasurable to it.

HEXAGON, formed of *hex*, six, and *gonia*, angle, in *Geometry*, a figure of six sides and six angles.

If the sides and angles be equal, it is called a *regular hexagon*.

The side of a *hexagon* is demonstrated to be equal to the radius of a circle circumscribed about the same. Hence, a *regular hexagon* is inscribed in a circle, by setting the radius off six times upon the periphery. To describe a *hexagon* on a given line *AB* (Tab. II. Geom. p. 48.) draw an equilateral triangle *ACB*; the vertex *C* will be the centre of a circle, which will circumscribe the *hexagon* required.

HEXAGON, in *Fortification*, is a fortress with six bastions, or a genus of **TRAI**.

The word is derived of the Greek *hex*, six, and *gonia*, a corner.

The bodies of this genus are parts of a columnar form, adhering to some solid body at the base, and terminated at the point by a pyramid. The pyramid and column are both hexastichal, or composed each of six sides.

Of this genus there are three known species. 1. A slender one with a long pyramid, composed of so pure and clear a spar, that it resembles crystal, and is found in Ockley Hole, on Mendips hills, and in some other parts of England. 2. A somewhat thicker one, with a long irregular pyramid, found in the mines of Cornwall and Devonshire, and common also in those of Germany. 3. One with a very short pyramid, found in the Derbyshire lead-mines, and in those of the Harzschell in Germany. Hill's *Min.* of Fossils, p. 228.

HEXAMERON, or **HEXAMERON**, a name given to divers writings, both of ancient and modern authors, containing commentaries, or discourses, on the first chapter of Genesis; wherein is delivered the history of the creation, or the first six days of the world.

The word is Greek, formed of *hexamero*, or *hexameros*, compounded of *hex*, six, and *meros*, which in the Doric dialect is wrote *metra*, day.

St. Basil, St. Ambrose, &c. have wrote *Hexamerus*.

HEXAMETER, compounded of *hex*, six, and *metron*, measure, in the *Ancient Poetry*, a verse used by Greek and Latin writers, consisting of six feet.

The first four feet of an *hexameter* may be indifferently either dactyls, or spondees; but the last foot, in strictness, is always to be a spondee, and the last but one a dactyl. Such is that of Homer,

En diop se pephnoti, ego Dioneides agos.

And that of Virgil,

Disjuncti pugnant, et non tempera dicunt.

Hexameter verses are divided into *heroici*, which are to be grave and majestic; suitable to the dignity of heroic poetry; and *saturnici*, which may be more loose and negligent, as those of the epistles of Horace.

Epic poems, as the *Iliad*, *Odyssey*, *Æneid*, &c. consist of *hexameter* verses alone; elegies and epistles ordinarily consist, alternately, of *hexameters* and *pentameters*. Some of the French and English poets have attempted to compose in *hexameter* verses, but without success. John made the first essay in 1753, with a dilucid in praise of Oliver de Magny, which Palsgrave represents as a masterpiece. It is this:

*Phidias, Amas, Cyprius, vent sejour, nourris & vers
Tu vers, L'art d'ou, d'ou, d'ou, d'ou, d'ou, d'ou, d'ou.*

But this kind of poetry pleases nobody. The modern languages are not at all fit for a kind of verse whose cadence depends altogether on long and short syllables.

HEXAMILLION, **HEXAMILLI**, or **HEXAMILLIUM**, in *Antiquity, a celebrated wall, built by the emperor Trajan, in 113, over the ruins of Corinth.*

It took its name from *hex*, six, and *millia*, which in the vulgar Greek signifies a mile; as being six miles long.

The design of the *hexamillon* was, to defend Peloponnesus from the incursions of the Barbarians. Amurath II. having raised the siege of Constantinople, in the year 1474, demolished the *hexamillon*; though he had before concluded a peace with the Greek emperor.

The Venetians restored it in the year 1463, by thirty thousand workmen, employed for fifteen days, and covered by an army, commanded by Bertoldo d'Este, general of the land-forces; and Louis Laureano, commander of the sea.

The insects made several attempts upon it, but were repulsed, and obliged to retire from the neighbourhood thereof; but Bertoldo being killed at the siege of Corinto, which was attempted soon after, Bartolo Calciano, who took on him the command of the army, abandoned, upon the approach of the besiegers, both the siege and the defence of the wall, which had cost them so dear, upon which it was finally demolished.

HEXANDRIA, in *Botany*, the sixth class of plants with hermaphrodite flowers, and six stamens or male parts in each, which are in some plants all of the same length, and in others are alternately one shorter and another longer.

The word is derived from the Greek *hex*, six, and *andria*, male.

This class contains five orders, viz. the *monogynia*, comprehending six-fifths, genera; the *dygyna*, two; the *trigyna*, nine; the *tetragyna*, one; and the *pentagyna*, one. See *TAB. Botany*, N^o 6, and *TAB. III. Botany*, Class 6.

HEXAPLA, formed of *hex*, six, and *apla*, I apply, in *Church History*, a Bible disposed in six columns, containing the text, and divers versions thereof, compiled and published by Origen, with a view of securing the sacred text from future corruptions, and to correct those that had been already introduced.

Eusebius, Hist. Eccl. lib. vi. cap. 16, relates, that Origen, after his return from Rome under Caracalla, applied himself to learn Hebrew, and began to collect the several versions that had been made of the sacred writings, and of these to compile his *Tetrapla* and *Hexapla*; others, however, will not allow him to have begun till the time of Alexander, after he had retired into Palestine, about the year 231.

To conceive what this *Hexapla* was, it must be observed that, besides the translation of the sacred writings, called the Septuagint, made under Ptolemy Philadelphus, about 280 years before Christ, the Scripture had been since translated into Greek by other interpreters. The first of these versions, of (reckoning the Septuagint) the second, was that of Aquila, a proselyte Jew, the first edition of which he published in the twelfth year of the emperor Adrian, or about the year of Christ 138; the third was that of Symmachus, published, as is commonly supposed, under Marcus Aurelius, but, as some say, under Septimius Severus, about the year 200; the fourth was that of Theodotion, prior to that of Symmachus, under Commodus, or about the year 176; these Greek versions, says Dr. Kennicott, were made by the Jews from their corrupted copies of the Hebrew, and were designed to stand in the place of the Seventy, against which they were prejudiced, because it seemed to favour the Christians. The fifth was found at Jericho, in the reign of Caracalla, about the year 217; and the sixth was discovered at Nicopolis, in the reign of Alexander Severus, about the year 228; lastly, Origen himself recovered part of a seventh, containing only the Psalms.

Now Origen, who had held frequent disputations with the Jews in Egypt and Palestine, observing, that they always objected against those passages of Scripture quoted against them, and appealed to the Hebrew text; the better to vindicate those passages, and confound the Jews, by shewing that the Seventy had given the sense of the Hebrew, or, rather, to shew, by a number of different versions, what the real sense of the Hebrew was, undertook to reduce all these several versions into a body, along with the Hebrew text, so as they might be easily confronted, and afford a mutual light to each other.

He made the Hebrew text his standard; and allowing that corruptions might have happened, and that the old Hebrew copies might and did read differently, he corrected himself with marking such words or sentences as were not in his Hebrew text, nor the later Greek versions, and to add such words or sentences as were omitted in the Seventy, prefixing an asterisk to the additions, and an obelisk to the others.

In order to this, he made choice of eight columns; in the first he gave the Hebrew text in Hebrew characters; in the second, the same text in Greek characters; the rest were filled with the several versions above mentioned; all the columns answering verse for verse, and phrase for phrase; and in the Psalms there was a ninth column for the seventh version.

This work Origen called *Ἑξαπλά*, *Hexapla*, *g. d. sexapla*, or a work of six columns, as only regarding the first six Greek versions. See *TETRAPLA*.

Indeed, St. Epiphanius, taking in likewise the two co-

latus of the text, calls the work *Odepla*, as consisting of eight columns.

This celebrated work, which Montfaucon imagines consisted of fifty large volumes, perished long ago, probably with the library at Casarea, where it was preserved, in the year 653; though several of the ancient writers have preserved us pieces thereof; particularly St. Chrysostom on the Psalms, Philoponus in his *Hexameron*, &c. Some modern writers have earnestly endeavoured to collect fragments of the *Hexapla*, particularly Flaminio Notilius, Densin, and F. Montfaucon, in two fello volumes, printed at Paris in 1713.

HEXAPOD, *it and with*, in *Zoology*, an animal with six feet.

HEXAPTRAMIDES, in *Natural History*, the name of a genus of *spira*.

The word is derived from the Greeks *hex*, six, and *ptera*, a perianth.

The bodies of this genus are *spira* formed into pyramids, composed of six flats or planes, and situated in six columns, but adhering to some solid body by their bases. Of this genus there are only two known species: 1. A short one with a broad base, which is very rare, and found only in the great mine at Goffin in France. And, 2. A long-pointed one, with a narrow base; this is found in the fissures of the alabaster quarries of the Harz-forest. Hill's Hist. of Foss. p. 225.

HEXASTYLE, composed of 16, *hex*, and *styla*, columns, in the *Antiqua Architecture*, a building with six columns in front.

The temple of Honour and Virtue at Rome, built by Mithras, was a *hexastyle*.

HEXIS, in the *Version of the Great Physicians*, a word used to express a firm and permanent habit, in opposition to *ichne* and *diathesis*, importing a transient or easily removed disposition.

HEYRS, in *Hydrology*, young timber-trees, usually left for standards in felling of wood or copes.

HHABD, in *Modern History*, is a name which the Mahometans give to one of the officers of their soldiers, answering to our *curates*.

HIENA, in *Zoology*. See *HYENA*.

HIASTAUTOMTEROM, a Chinese name, expressing a plant, the root of which is said to change, at a certain time, into a worm. Mr. Reaumur has given it the name of *planctus* in the French, but he has discovered the error of supposing such a transformation; the whole truth of the case being, that a certain caterpillar, when about to change into the chrysalis state, so nicely joins itself to the root of this plant, as to appear a part of it.

HIATCULA, in *Ornithology*. See *LAKE*.

HIATULA, in *Ichthyology*, a name given by some to the fish once usually called the *CHASMA*. It has this name from its opening its mouth to a great width, especially when dying, which is owing to its under jaw being much longer than the upper.

HIATULA is also a name by which Gana, and some other authors, have called the shell-fish more usually named *CHASMA*; a genus distinguished from other kinds by its always keeping its shell in some degree open, and in many species having so power to shut them entirely; for this reason they defend their naked bodies by burying themselves in the mud, or in other substances.

HIATUS, a Latin term, properly signifying the aperture of the mouth, from the verb *hauri*, to *suck*.

It is variously used, in works of literature, &c. to denote a *claus* or *gap*; particularly in verse, where there is a claus of vowels, by one word ending with a vowel, and the following one beginning with another:

As in *The* oft the ear the open vowels lift.

This clausing of vowels, so disagreeable to the ear, is called a *hiatus* in prose as well as verse. The Romans were so very careful to avoid it, that they always suppressed the preceding vowel even in prose; as it is observed by Cicero in his *Orator*. In writing, to avoid it, they used to insert the letter *d*: as in *redidit, redidit, midergo*, &c. Hence, on the base of the Dorian column, we meet with *prodidit, midergo, midergo*. See *Voss*.

HIATUS is also used for a defect in a manuscript copy, where something is lost or effaced by the injuries of time or otherwise.

In a theatrical place, there is said to be a *hiatus*, when a scene is not well connected to the next, but leaves the action interrupted, and the stage empty.

In matters of genealogy, *hiatus* is an interruption in a line or series of descendents.

HIBISCUS, in *Botany*. See *SYRIAN MALLOW*.

HICKUP, *HICKOCK*, *HICCOUGH*, *HICKEY*, or *HICCOUR*, *hiccupitus*, in *Medicine*, a sudden irregular inspiration, wherein the stomach, and the parts contained in the lower rectum, are impelled downwards.

The word seems formed of the Flemish *hick*, which signifies the same thing: others derive it *ab infundis*; others a *difficile habilitas*; but others think the most natural derivation to be from the sound yielded in this action.

The *hiccup* is not immediately a disorder of the stomach, as is usually imagined, but a convulsive motion of the diaphragm; whereby the muscle, retiring impetuously downwards, impels the parts beneath it.

It is occasioned by sharp humours; a too great plenitude of the stomach; a bit of any thing stopped at its upper orifice; or, in general, by any thing capable of irritating the nerves of the diaphragm.

The remedy for the *hiccup*, according to Hippocrates, is to fetch the breath very long, or even to stop the breath for some time. A faceting, happening upon a *hiccup*, generally cures it; the diaphragm, shook by the violent expiration, being apt to throw off what before irritated it. This motion, when it happens in acute diseases, is to be distinguished from that which happens at other times; and there is yet another kind of it different from either of these, which is familiar to children in dying.

The chronic *hiccup* is of two kinds; in its common state it remains on a person but a very short time, and in the other it remains long, and is attended with a febrile heat and a difficulty of breathing, with a remarkable noise in expiration.

Signs of it. It is usually preceded by a sense of a heavy pain in the breast and abdomen, and this is followed by a more or less difficult breathing, with a sound or noise in the expiration; and the *hiccup* itself, which in chronic cases is attended with a sensation of internal ulceration.

Persons subject to it. These are principally men who eat large meals, and load the stomach by drinking largely after them, and who eat large quantities of the summer fruits, especially when unripe. In acute fevers, a *hiccup* is very familiar to those persons who any have internal inflammation; and it is very common in the fevers that attend women in their lying-in. The causes of the common *hiccup* are an overloading the stomach with food, chiefly with such as is hard of digestion; especially if swallowed voraciously, and large draughts taken after it: large draughts of cold liquors, or cooling internal medicines, also sometimes bring it on; and it frequently happens when the peristaltic motion of the bowels is disturbed by violent purges or vomits. In acute diseases, it is principally owing to an inflammation either in the pylorus, the mesentery, or the sinus part of the liver, and in dysenteria it sometimes comes on from an inflammation of the ileum. Slow poisons also sometimes show their effects in a violent and unmitigable *hiccup*.

Prognosis. The common *hiccup* is usually a distemper of little trouble, and attended with no danger; yet there have been instances of persons dying of it without any other disorder: but these fatal *hiccups* will be found, when all circumstances are considered, to have been very different in their nature and origin from the common kind, and usually to have arisen from some violent motion of the body. When the *hiccup* comes on in acute fevers, about the day of the crisis, it is always dangerous; for this, though in itself but a semi-convulsive motion, yet very easily degenerates into an universal convulsion of the whole body, under which the patient usually soon expires. In malignant fevers also, and gangrenes, they are often the forerunners of death. *Hiccups* attending colics, in persons who have not before been subject to them, are always a bad omen.

Manner of cure. The common *hiccup* seldom requires any thing of medicine for its cure; it usually goes off in a little time of itself, or if not, is easily thrown off by warm liquors, as tea, coffee, or the like. But when it remains on the person a long time, as it sometimes will for several weeks, then the following method is proper for its cure: the crudities of the primæ viæ are to be carried off by gentle purges, as small doses of rhubarb, and the like; and by the assistance of the abstergent and emollient ethers. After this the stomach is to be strengthened by bitters and mild chalybeats, and by wearing externally bags with camphor, and the aromatic roots and carminative seeds. Sometimes also it will be necessary to give absorbents mixed with the calx of antimony, to correct the acrimony of the humours. When the fit has by these means been carried off, the return of it is to be prevented by taking now and then a dose of some gentle purge, and after every meal swallowing two or three corns of pepper in a glass of hot wine. When the *hiccup* comes on as a symptom in acute diseases, respect is always to be had to the primary disease, and then the common alexipharmics are to be given, with spirit of nitre dulcified, and a gentle dose of the nitrous and absorbent medicines, such as a powder prepared of purified nitre and crabs-eyes, or the like; and bags with aromatics may be worn externally. Castor, and the other nervous medicines, externally, have their use in this case,

but internally taken they have no effect, either in this or any the like complaints in the lower belly. Cassia fistula, fenna, and the other purges, which are apt to create flatulencies, are not to be given in these cases. When the *hiccup* proceeds from an inflammation of the stomach, &c. cooling regimen must be used; the patient must be bled, and frequently take a few drops of the sweet spirit of nitre in a cup of wine-whisky, and his stomach should be fomented with cloths dipped in warm water, or bladders filled with warm milk and water may be applied to it. When it is occasioned by a gangrene of mortification, the Peruvian bark and other antiseptics should be freely used. When it proceeds from a foul stomach, a gentle vomit and purge will be of service. When it proves obstinate, recourse must be had to the most powerful aromatic and antispasmodic medicines. In this intention, fifteen or twenty grains of mull may be made into a bolus, and repeated occasionally: opiates, used cautiously, are also of service; a lump of sugar, dipped in compound spirits of lavender, or the volatile aromatic tincture, may be taken often. External applications, such as the stomach plaster, or a cataplasm of Venice treacle, to the region of the stomach, are sometimes beneficial. People who are subject to habitual *hiccups*, will find relief by usually wearing a belt round the abdomen; and such should always use moderate exercise, and avoid large draughts of cold liquors. Junker's Consp. Med. p. 639. Buchan's Dom. Med. p. 475.

Dr. Hoyer informs us, that a most violent *hiccup*, which had resisted a great number of medicines, was at last cured by sucking women's milk. Act. Acad. Nat. Curios. vol. iv. obs. 3.

HICKWALL, in Ornithology, the name of a small species of wood-pecker, called by authors *picus vicius minor*; a small bird of not above an ounce weight, very beautifully variegated with black, white, and brown. The head in the female of this species has a white spot on the crown, and in the males a red one. It climbs trees like the common large wood-pecker, and like it feeds on worms and other insects which it finds there.

HIDAGE, or *HYDAGE*, an extraordinary tax, anciently payable to the king for every hide of land. See *HIDE*. *Sunt etiam quædam communes præfationes, quæ servitium non decernunt, nec de consuetudinibus veniunt, nisi cum nullitas ostenditur, vel cum rex concessit, sicut sunt hid-age, corvagia, & carvagia, & alia plura de natiuitate, &c. in consuetudinibus totius regni indolis, &c. que ad dominum non pertinent, &c.* Bracton, lib. ii. cap. 6. King Edward, in the year of Christ 1094, upon the landing of the Danes at Sandwich, taxed all his lands by hides. Every three hundred and ten hides of land, on this occasion, found one ship furnished; and every eight hides found one jack and one saddle, for the defence of the realm. William the Conqueror took six shillings for every hide of land in England.

HIDAGE is also used for being quit of that tax; otherwise called *HIDE-GILD*.

HIDALGO, q. d. a *son of hid*, in Modern History, a title given in Spain to all who are of noble family.

HIDE, the skin of a beast; particularly that of a bullock or cow. See *SKIN* and *TANNING*.

We have *hides* of divers denominations, according to their state, quality, &c.

HIDE, curried, is that which, after tanning, has passed through the carrier's hands, and has thus received its last preparation, and is fitted for use. See *CURRYING*.

HIDE, raw, or *Green HIDE*, is that which has not undergone any preparation; being in the same condition as when taken off the carcase.

HIDE, salted, is a green hide, seasoned with sea-salt and alum, or salpêtre, to prevent its spoiling and corrupting, either by keeping it too long in cellars, or in transporting it too far in a hot season.

There are also *hides dried in the air*, sent from America; particularly those of buffaloes.

HIDE, tanned, is a hid either green, salted, or dried, further dressed and prepared by the tanner, by piling of the hair, and steeping it in pits of lime and tan. See *TANNING*.

Tanned *hides* are commonly carried along with the artillery of an army. They are used in the fire-works stores, for covering powder or charged bombs from the rain or from sparks of fire. They are also used on batteries, or in a laboratory.

HIDE, or *HIDE, HYDA*, in our Ancient Customs, denoted a measure or quantity of land, containing so much as could be yearly tilled with a single plough.

Beda calls the *hide* of land *famula*, and defines it to be so much as was sufficient for the ordinary maintenance of one family. In other authors it is called *mansum, mansus, carvata*, &c.

Crompton, in his Juridic. fol. 322, says, a *hide* of land contains one hundred acres: he adds, that eight hides male

make a knight's fee. In ancient manuscripts, the *hide* is fixed at one hundred and twenty acres. But Sir Edward Coke notes, that a knight's fee, a *hide* or ploughland, a yard-land, and an oxgang of land, do not contain any certain determinate number of acres. See **CARUCATE**.

The distribution of England into *hides* of land is very ancient, there being mention made of it in the laws of king John, cap. 14. *Henricus 1. m. archiepiscopus filius sue gratia imperatoris, cepit ad unumquodque hida Anglie tres sili. Spelman.*

HIDE and **GAIN**, in our *Old Writers*, signified arable land, to gain the land being as much as to till it.

HIDE-BIND, a disorder of a horse or other beast, wherein his skin sticks so tight to his ribs and back, as not to be loosened from it with the hand.

The disorder is sometimes owing to poverty and bad keeping; at other times to over-riding or a surfeit, the horse being suffered when he is not to stand long in the wet; or to a morbid dryness of the blood, which, not having its natural course, causes the skin to shrink up and cleave to the bones.

Among *Hyndmen*, trees also are said to be *hide-bound* when the bark sticks too close.

HIDEL, in our *Ancient Statutes*, signifies a place of protection or sanctuary.

HIDGELD, or **HIDGELD**, in the laws of king Canute, is explained by *pretium redemptionis fidei*, the price by which a servant was to redeem his skin from being whipped.

The word is formed from the *Span* *hide*, *skin*, and *geld*, *payment*. *Si hinc felle datus episcopus preda daretur; si ferus eriam perdat, nulli hominum; i. e. let him be whipped (which was the punishment for servants), or let him pay for his skin; by which payment he is to be excused from whipping.*

HIDROA, from *hyos*, *fever*, in the *Medicinal Writings* of the *Arabs*, a kind of pustules arising from bilious, vitid, and irritating humors, very troublesome to the skin, and most so in summer-time, when they make their eruption with the sweat. They are reckoned by Hippocrates among the diseases peculiar to the summer.

HIDROCRICTICA, a term used to express the judgments passed by physicians on their patients, on observing the sweats that have attended the disease.

HIDRONOSOS, a name given, by some authors, to that terrible disease the *fuder Anglicana*, or *SWELLING SICKNESS*.

HIDROPYREPOS, of *hyos*, *fever*, and *pyros*, *fever*, the *swelling fever*, a name given by some to the *fuder Anglicana*, or *SWELLING SICKNESS*.

HIDROTICS, or **HYDROTICS**, in *Medicine*, the same with **SUDORIFICS**.

The word is composed of the Greek *hyos*, *fever*. Contraries; zedory, gusiaticum, angelica, &c. are of the number of *hidrotics*, or *hidrotic* medicines.

HIMALJA, in *Antiquity*, the same with **TRUMALIA**.

HIERACHIDES, in *Botany*, a name given by Vaillant to a genus of plants, first called by Linnaeus *erpi*. See **BOTANICAL HISTORY**.

HIERACITES, **HIERACITES**, a sect of ancient heretics, at the close of the second century, denominated from their leader Hierax, a bookeller of Leontium, and eminently distinguished by his extensive learning, and a venerable air of sanctity and virtue.

He absolutely desired the resurrection of the body, maintaining that the soul alone rose again, and that the resurrection was altogether spiritual. Epiphanius furnishes, that he might have imbibed this error from Origen.

The same Hierax, and his followers, likewise condemned the use of flesh, wine, and marriage; being of opinion, that they were only allowed under the Old Testament, and till the coming of Jesus Christ; but that under the new law, they were prohibited, as incompatible with the kingdom of God.

St. Epiphanius produces the passages of Scripture, whereon he founded this doctrine; he adds, that Hierax did not give into Origen's error with regard to the mystery of the Trinity, but allowed the Son to be really and truly begotten of the Father. He was also orthodox with respect to the Holy Ghost, excepting for some peculiarities received from the Melchiteans, on which he had refused, maintaining that Melchisedec was the Holy Ghost. He also excluded from the kingdom of heaven children, who died before they had arrived to the use of reason. He lived a very austere life, and promoted the same among his followers; but, after his death, they degenerated very fast.

HIERACIUM, in *Botany*. See **HEWHERD**.

HIERA PICRA, in *Pharmacy*, originally a kind of electary, first described by Galen, composed of aloes, cinnamon, asarabacca, spica-nardi, saffron, and mastic, made up with honey, or syrup of violets and honey.

Vol. II. No 171.

It is denominated from the Greek *hyos*, *fever*, *holy*, because of its rare virtues; and *picra*, *amar*, *bitter*; aloes, which is the base thereof, rendering it extremely bitter.

It was used to purge and cleanse the stomach, remove obstructions, promote the menes and hemorrhoids, and sweeten the blood; but its chief use among us is in powder, for making the tincture sacra.

Besides this simple *hiera picra*, there is a compound sort, called *diacolocynthida Picra*, because colocynthis is the base thereof; and it was first used, with good success, by Paches of Antioch, in divers obstinate diseases. It is composed of colocynthis, opopanax, aritholochia rotunda, agaric, and other ingredients. It is used in epilepsies, apoplexies, palfies, and lethargies; and to excite the menses, and promote the expulsion of the after-birth.

There is also a third sort of *hiera*, called *hiera*; but rarely used: Dr. Quincy says, it is one of the most ridiculous insidiously ever contrived. It passes for a cordial, &c.

HIERA PICRA, *infusure*. See **TINCTURA sacra**.

HIERARCHY, **HIERARCHIA**, in *Theology*, the order or subordination among the several orders or ranks of angels. The word is Greek *hierarcha*, formed of *hyos*, *fever*, *holy*, and *arche*, *principatus*, *rule*; *di*, *de*, *hys* *arche*, *hys* *dominus*, or *rule* in *holy* things.

St. Dionysius, and other of the ancient writers, establish nine orders or orders of celestial spirits; viz. *seraphim*, *cherubim*, *throni*, *dominiani*, *principales*, *potentes*, *virtutes*, *angeli*, and *archangeli*; and these they divide into three *hierarchies*.

HIERARCHY is also used for the subordination between prelates and other ecclesiastics. See **PRIEST**, &c.

Archbishops, bishops, priests, and deacons, compose the *hierarchy* of the church of England. In that of Rome, the pope has likewise a place at the head of the *hierarchy*.

F. Cellor, a Jesuit of Paris, has published a volume expressly (*De Hierarchia & Hierarchia*) on the *hierarchy*, and those who compose it. He there distinguishes a created and an uncreated *hierarchy*; a divine and a human, or ecclesiastical *hierarchy*; and in this, a *hierarchy* of jurisdiction, a *hierarchy* of *ancient*, and a *hierarchy* of *graces*, the most sublime of all.

He defines *hierarchy*, in the general, a command or sovereignty in holy things; *principatus*, *five imperium*, in *rebus sacris*; on which footing he holds, that *hierarchy* excludes all below bishops; and that neither priests nor deacons can be reckoned among the number of *hierarchists*. Bellarmine, Hallier, Aurelius, &c. he holds, were all mistaken, and did not distinguish between being of the *hierarchy*, and being under it.

HIERATIC paper, among the *Ancients*, was the finest sort of paper, which was set apart only for sacred or religious uses. See **PAPER**.

HIERO's crown, in *Hydrostatics. The history of this crown and of the important hydrostatical proposition, to the discovery of which it gave occasion, is as follows: Hiero, king of Syracuse, having furnished a workman with a quantity of gold for making a crown, suspected that he had been cheated, and that the workman had used a greater alloy of silver than was necessary in the manufacture of it; he, therefore, applied to Archimedes for a discovery of the fraud. This celebrated mathematician was led by chance to a method of detecting the imposture, and of determining precisely the quantities of gold and silver of which the crown was composed: for he observed, whilst he was bathing in a tub of cold water, that as he immersed his body in it, the water ran out; and he immediately concluded, that the water which ran out, when his whole body was immersed, was equal in bulk to his body. It is said, that he was so pleased with the discovery, as to run about naked crying out, *Eureka, Eureka, I have found it*; and others affirm, that he offered a hetsomb to Jupiter for having inspired him with the thought.*

On this principle he procured a ball of gold and another of silver, exactly of the weight of the crown, considering, that if the crown were altogether of gold, the ball of gold would be of the same bulk as the crown, and when immersed in water, would raise the water just as high as the crown immersed; but if it were wholly of silver, the ball of silver being immersed, would raise the water no higher than the crown immersed; and if the crown was of gold and silver mixed in a certain proportion, this proportion would be discovered by the height to which the crown would raise the water higher than the gold, and lower than the silver. Accordingly, let **AMLE** (Tab. IV. *Hydrostatics*, fig. 29.) be a vessel filled with water to the height DC, and let the mass of gold, equal in weight to the crown, on being immersed into the water, raise the surface of it to E, and the mass of

silver raise it to G; then if the height of the vessel above DC be divided into equal parts, and $DF=11$, and $DG=19$, it is plain the bulk of gold and silver will be as DF to DG , and the specific gravities in the inverse proportion of these quantities, or as DG to DF . If the crown be immersed, it will raise the surface of water to E; whence the proportion of the bulk of the gold and silver in the crown may be determined. For since the difference of the specific gravities of the gold and silver is $DG-DF=FG=8$, if the bulk of the crown is divided into eight equal parts, it is evident, that since the specific gravities of the deflated and pure gold crowns will be as the bulks inversely, that is, as DF to DE , we can easily find the point H, which will express the specific gravities of the former, for $DE:DF::DG:DH$. This point H always divides the difference FG into two parts GH, HE, which have the same proportion as the parts of silver in the crown to the parts of gold; for as the point E ascends, the point H descends, and when E coincides with G, H falls upon E, and the crown becomes wholly silver; on the contrary, when E descends to F, and H ascends to G, the crown becomes wholly gold; therefore FH will be every where as LG as the parts of gold to the parts of silver in the crown. Consequently, in the present case, because the crown, when immersed, raises the water to the height DH, and H is three divisions below G, it shews that three of the eight parts of the crown are silver, and the other five parts gold, as H is five of the divisions above F. Hence the bulk of the gold in the crown is to that of the silver as 5 to 3. In some few methods as this Archimedes deduced his proposition, viz. that the difference of the specific gravities of the compound and lighter ingredient, i. e. 5, (supposing the specific gravity of gold to silver as 19 to 11), and the specific gravity of the king's crown to be 16, is to the difference of the specific gravities of the heavier ingredient and the compound, i. e. 8, as the bulk of gold to that of silver made up of: so that if the whole crown were divided into eight parts, the gold would consist of five, and the silver of three; and the magnitudes 5 and 3, multiplied by the specific gravities 19 and 11 respectively, will give the numbers 95 and 33, expressing the proportion of the weight of the gold to that of the silver.

This proposition of Archimedes may be demonstrated analytically in the following manner: let the magnitudes of the gold and silver in the crown be A and B, and their specific gravities as a and b; then since, the absolute gravity of any body is compounded of its magnitude and specific gravity, the weight of the gold is aA, of the silver bB, and of the crown $aA+bB=c \times A+B$, supposing c to be the specific gravity of the mixture. Hence $aA-aB=bB$; and consequently $c-A=a-b::A:B$, as before. COROLLARY. See the *Leçons* p. 37. *Martin's Phil. Brit.* vol. I. p. 305, &c. See *Specific Gravity and Gravitation*.

HIEROBOTANE, in *Italy*. See *VERVAIN*.

HIEROBULBUM, in *Botany*, a name given by the ancients to the *colchicum*.

Some have wondered that the medical writers of those times should give this name, which signifies the *sacred root*, to a thing that was generally allowed to be a poison; but Wedelius has proved that it may be given, under proper regulations, with safety and great success, in malignant and pecthial fevers, and in the worst kinds of the small-pox and measles. The manner he gave it was in a mixture with bezoar and plantain-root, and this he called his *ARCANUM duplicatum catharticum*, or pessimal alexipharmic. The ancients had a custom of wearing this root about their necks, by way of an amulet, to prevent infection; and it was probably from this that it obtained the name of the sacred bulb.

HIEROCERYCE, in *Mythology*, the chief of the sacred heralds in the mythologies of Ceres, whose office was to exclude all improper persons, to preserve order in the celebration of these mysteries, and to recite the formulae of initiation.

The *Hieroceryce* represented Mercury, and was distinguished by the same attributes: the office was perpetual, and belonged to the family of the *Ceryces*, the descendants of Ceryx, the last son of Eumolpus.

HIEROCORACES, q. d. *sacred crowns*, in *Mythology*, were ministers of Mythus, or of the Sun, which the Persians worshipped under this title.

HIEROGLYPHIC, *hieroglyphica*, a symbol or mystic figure, used among the ancient Egyptians to cover or conceal the secrets of their theology.

The word is compounded of the Greek *hieros*, *sacred*, *hieros*, and *glyphein*, *to engrave*; it being the custom to have the walls, doors, &c. of their temples, obelisks, &c. engraven with such figures.

Hieroglyphics are properly emblems or signs of divine,

sacred, or supernatural things; by which they are distinguished from common symbols, which are signs of sensible and natural things.

Hermes Trismegistus is commonly esteemed the inventor of *hieroglyphics*: he first introduced them into the Heathen theology; from whence they have been transplanted into the Jewish and Christian.

Sacred things, says Hippocrates, should only be communicated to sacred persons. Hence it was, that the ancient Egyptians communicated to none but their kings and priests, and those who were to succeed to the priesthood and the crown, the secrets of nature, and the secrets of their morality and history; and this they did by a kind of cabbala, which, at the same time that it instructed them, only amused the rest of the people. Hence the use of *hieroglyphics*, or mystic figures, to veil their morality, politics, &c. from profane eyes. Spots. This author, it may be observed, and many others, do not keep to the precise character of a *hieroglyphic*, but apply it to profane as well as divine things.

Hieroglyphics are a kind of real characters, which do not only denote, but in some measure express the things. Thus, according to Clemens Alexandrinus, Strom. v. a lion is the *hieroglyphic* of strength and fortitude; a bullock, of agriculture; a horse, of liberty; a sphinx, of subtilty, &c.

Such is the opinion that has generally been embraced both by ancient and modern writers, of the origin and use of *hieroglyphics*; it has been almost uniformly maintained that they were invented by the Egyptian priests, in order to conceal their wisdom from the knowledge of the vulgar. But the late bishop Warburton hath, with much ingenuity and learning, endeavoured to shew, that this account is erroneous.

According to this writer, the first kind of *hieroglyphics* were mere pictures; because the most natural way of communicating our conceptions by marks or figures was by tracing out the images of things; and this is actually verified in the case of the Mexicans, whose only method of writing their laws and history was by this picture-writing. But the *hieroglyphics* invented by the Egyptians, was an improvement on this rude and inconvenient essay towards writing; for they contrived to make them both pictures and characters: in order to effect this improvement, they were obliged to proceed gradually, by first making the principal circumstance of the subject stand for the whole, as in the *hieroglyphics* of Horapollo, which represent a battle of two armies in array by two hands, one holding a shield, and the other a bow; then putting the instrument of the thing, whether real, or metaphorical, for the thing itself, as an eye and scepter to represent a monarch, a ship and pilot the governor of the universe, &c. and finally, by making one thing stand for or represent another, where their observations of nature or traditional superstitions led them to discover or imagine any resemblance; thus, the universe was designed by a serpent in a circle, whose variegated spots denoted the stars; and a man who had nobly surmounted his misfortune was represented by the skin of the Lyons, because this was supposed to furnish an invulnerable defence in battle.

The Chinese writing, he observes, was the next kind of improvement in the use of *hieroglyphics*; the Egyptians joined characteristic marks to images; the Chinese threw out the images, and retained only the contracted marks, and from their marks proceeded *LETTERS*. The general concurrence of different people in this method of recording their thoughts, can never be supposed to be the effect of imitation, slender views, or chance; but must be considered as the uniform voice of nature, speaking to the rude conceptions of mankind: for not only the Chinese of the East, the Mexicans of the West, and the Egyptians of the South, but the Syrians, likewise, of the North, and the intermediate inhabitants of the earth, viz. the Indians, Poticenians, Ethiopians, &c. used the same way of writing by picture and *hieroglyph*.

The bishop farther shews, that the several species of *hieroglyphic* writing took their rise from nature and necessity, and not from choice and artifice, by tracing at large the origin and progress of the art of speech. He proceeds to shew how, in process of time, the Egyptian *hieroglyphics* came to be employed for the vehicle of myth. They used their *hieroglyphics* two ways; the one more simple, by putting the part for the whole, which was the *caricature hieroglyphics*; and the other more artificial, by putting one thing, of resembling qualities, for another, called the *typical hieroglyphics*: thus the moon was sometimes represented by a half circle, and sometimes by a cynocephalus. They employed their proper *hieroglyphics* to record openly and plainly their laws, policies, public morals, and history, and all kinds of civil matters: this is evident from their obelisks, which were full of

hieroglyphics

hieroglyphic characters designed to record singular events, memorable actions, and new inventions; and also from the celebrated inscription on the temple of Minerva at Sais, where an infant, an old man, a hawk, a fish, and a river-horse, expressed this moral sentence: All you who come into the world and go out of it know this; that the gods have impotence. However, the tropical *hieroglyphics*, which were employed to divulge, gradually produced symbols which were designed to secrete or conceal: thus Egypt was sometimes expressed by the crocodile, sometimes by a burning center with a heart upon it; where the simplicity of the first representation and the diffuseness of the latter flow, that the one was a tropical *hieroglyphic* for communication, and the other a tropical symbol intended for secrecy.

Enigmatic symbols were afterwards formed by the assemblage of different things, or of their properties that were less known; and though they might have been intelligible at first, yet, when the art of writing was invented, *hieroglyphics* were more generally disused, the people forgot the signification of them, and the priests, retaining and cultivating the knowledge of them, because they were the repositories of their learning and history, at length applied them to the purpose of preserving the secrets of their religion.

Symbols were the true original of animal worship in Egypt, as Sir John Marsham conjectured, Can. Con. p. 58. because in these *hieroglyphics* was recorded the history of their greatest deities, their kings, and lawgivers: represented by animals and other creatures: the symbol of each god was well known and familiar to his worshippers, by means of the popular painting and engraving, on their temples, and other sacred monuments; so that the symbol presenting the idea of the god, and that idea exciting sentiments of religion, it was natural for them, in their addresses to any particular god, to turn to his representative mark or symbol: especially when we consider further, that the Egyptian priests feigned a divine origin for *hieroglyphic* characters, in order to increase the veneration of the people for them. These would of course bring on a relative devotion to these symbolic figures, which, when it came to be paid to the living animal, would soon terminate in an ultimate worship.

Another consequence of the credulity of the *hieroglyphic* characters was, that it disposed the more superstitious to engrave them on gems, and wear them as amulets or charms. This magical abuse seems not to have been much earlier than the established worship of the god Serapis, which happened under the Ptolemys, and was first brought to the general knowledge of the world by certain Christian heretics and natives of Egypt, who had mixed a number of Pagan superstitions with their Christianity. These gems, called *ABRAXAS*, are frequently to be met with in the cabinets of the curious, and are engraved with all kinds of *hieroglyphic* characters. To these *abraxas* succeeded the *TALISMANS*. Warburton's Divine Legation of Moses demonstrated, vol. ii. passim.

HIEROGRAMMATEL, *hierogrammatas*, among the *Ancient Egyptians*, were the priests appointed to explain mysteries of religion; and to direct the performance of the ceremonies thereof; and for this purpose they had a kind of sacred alphabetical character, different from the political one, and which the writer, cited in the last article, considers as one of the four kinds of Egyptian writing. This, as well as the epicholic, used in civil matters, was formed by the letters of an alphabet; and, from its being used only in religious matters, was called *hierogrammatic*. The other two species of writing were the *HYROGLYPHIC* and *hieratic*.

The *hierogrammatas* interpreted and wrote *hieroglyphics* and *hieroglyphical* books, and occasionally explained them, together with other matters relating to the doctrines of religion. If we may believe Suidas, they were all prophets; at least, he relates, that a *hierogrammatas* foretold to an ancient king of Egypt, that there would be an Israelite of great wisdom, virtue, and renown, who should humble Egypt.

The *hierogrammatas* were always near the king, to assist him with their informations and counsels: the better to fit them for this, they made use of the skill and knowledge they had acquired in the laws and the motions of the heavenly lights, and even of the writings of their predecessors, wherein their functions and duties were described. They were exempted from all civil employments, were reputed the first persons in dignity next the king, and bore a kind of scepter in form of a ploughshare.

After Egypt became a province of the Roman empire, the *hierogrammatas* sunk into neglect.

HIEROLOGY denotes a discourse on sacred things. Among the Jews and Greeks, this term was used for the nuptial benediction.

HIEROMANTIA, *hieromantia*, in *Antiquity*, a general name for all kinds of divination, made from the various things offered in sacrifice to the gods. They first made conjectures from the external parts and motions of the victim; then from its entrails, from the flame in which it was consumed, from the cakes and flour, from the wine and water, &c. Vide Port. Archæol. Græc. lib. ii. cap. 14. tom. i. p. 314.

HIEROMENIA, *hieromenia*, in *Ancient Chronology*, a name given to the month in which the Nemean games were celebrated. It was the same with the Athenian month Decrometion, and answered to the latter end of our August and beginning of September.

HIEROMNEMON, *hieromnemon*, among the *Ancient Greeks*, signified a delegate chosen by lot, and sent to the great council of the *AMPHICTYONS*, where he was to take care of what concerned religion. The *hieromnemon* were reckoned more honourable than the other members of that assembly, the general meetings of which were always summoned by them, and their names were prefixed to the decrees made by that council.

HIEROMNEXION, compounded of *hieros*, sacred, and *mnexion*, one who advertises or puts in mind of, an officer in the ancient Greek church, whose principal function was to stand behind the patriarch at the sacraments, ceremonies, &c. and show him the prayers, psalms, &c. which he was to recite.

He also clothed the patriarch in his pontifical robes, and assigned the places of all those who had a right to be around him when seated on his throne, as the master of the ceremonies now does to the pope.

The *hieromnemon* was commonly a theban: when he was in priest's orders, as it sometimes happened, he was excluded from dressing the patriarch in his pontifical habits. Whether he were deacon or priest, he had always under him an officer named *epithymia*. He had also the keeping of the book entitled *Contacton*, or book of consecration; and that called the *Enthronasticon*, which was a sort of ritual.

HIEROMNEMON, in the *Writings of the Ancients*, was also the name of a stone said to have been used in divination, and called by others *crotylus* and *amphicompe*. There is no description left us of it by the ancients, from which we may guess what stone it was, or from whence it was brought.

HIERONYMITES, compounded of *hieros*, holy, and *monas*, name, or Hermit of St. Jerome. See **JERONYMITES**.

HIEROPHANTES, or **HIEROPHANTA**, from *hieros*, holy, and *phantas*, I appear, in *Antiquity*, a priest among the Athenians.

The *hierophantas* was properly the chief person that officiated in the *ELEUSINIA*, that great solemnity sacred to Ceres.

This office was first executed by Eumolpus, and continued in his family for twelve hundred years, though when any person was appointed to this dignity, he was required always to live in celibacy.

St. Jerome says, that the *hierophantas* extinguished the fire of lust, by drinking cicuta or the juice of hemlock, or even by making themselves eunuchs. Apollodorus observes, that it was the *hierophantas* who instructed persons initiated into their religion in the mysteries and duties thereof, and that it was hence he derived his name: for the same reason he was called *prophetas*, the prophet. He had officers under him to do the same thing, or to assist him therein, who were also called *prophetas* and *reges*, i.e. *explainers of doctrines*.

To the *hierophantas* it belonged to dress and adorn the statues of the gods, and to bear them in processions and solemn ceremonies.

There were also women employed in the ceremonies of the Eleusinia.

HIEROPHYLAX, of *hieros*, sacred, and *phylax*, letter, of *phylax*, I keep, an officer in the Greek church. His function is that of guardian or keeper of the holy things, utensils, vestments, &c. answering to our *sacristan* or *factotum*.

HIEROSCOPY, **HIEROSCOPIA**, formed of *hieros*, sacred, and *scopia*, I view or consider, a kind of divination performed by considering the victim, and observing every thing that occurs during the course of the sacrifice.

HIGN, *hign*, a term of relation, applied to a body, considered according to its third dimension, or its elevation above the horizon, or even above the ground.

HIGN is also used to denote a person in power, dignity, &c.

So in England we say *high* court of parliament.

HIGN chancellor, *hign*. See **CHANCELLOR**.

HIGN church. See **CHURCH**.

HIGN bearing *hign*. See **COCK**.

HIGN commission *hign*. See **COMMISSION**.

HIGN constable of England. See **CONSTABLE**.

HIGN court of Parliament. See **PARLIAMENT**.

HIGH and DRY is a phrase, among *Seamen*, denoting the situation of a ship when the *hull* has run aground, so as to be seen dry upon the strand.

HIGH DUTCH is the German tongue in its greatest purity, as spoken in *Münster*, &c. See **TEUTONIC**, &c.

HIGH, in *Algebra*, is sometimes used in the same sense with *low*, in opposition to *low*; and sometimes in the same sense with *weight*, in opposition to *grave*.

HIGH OPERATION, in *Surgery*, is a method of extracting the stone; thus called, because the stone is taken out at the upper part of the bladder.

For the method of performing the *high operation*, see **LITHOTOMY**.

The *high operation* is said to have been first practised by *Rondelet*; others say by *Franco* a surgeon of *Louisaire*. It was revived by *Mr. Douglas*, and practised with good success by *Mr. Chelidon* and others.

HIGH PRIEST. See **PONTIFEX**.

HIGH RELIEF. See **RELIEVO**.

HIGH SEA, or ocean, is that far from land. See **SEA**.

HIGH SHIPWARD. See **STERNWARD**.

HIGH TIDE, in *Botany*. See **MULLIN**.

HIGH TIDE. See **THE APOD**.

HIGH TRAVELER. See **TREASURER**.

HIGH WATER, is that state of the *TIDES* when they cease to flow up, or the greatest height of the flood-tide.

HIGHWAY, *via regia*, a free passage for the king's subjects, on which account it is called the king's highway, though the freehold of the soil belongs to the lord of the manor, or the owner of the land. Those ways that lead from one town to another, and such as are drift or cart-ways, and are for all travellers in great roads, or that communicate with them, are *highways* only; and their regulation is under the care of surveyors.

A river that is common to all men, is also called a *highway*.

Where a *highway* lies within a parish, the parish is bound to repair it, unless it appears that the same ought to be repaired by some particular person, either by reason of tenure or prescription. At common law it is said, that all the country ought to make good the reparations of a *highway*, where no particular persons are bound to do it, because the whole country have their ease and passage by that way.

If a *highway* leading through a field is out of repair, travellers may justly going out of the track, though these be curbed, and in case a *highway* is not sufficient, any passenger may break down the inclosure, and go over the land adjoining, until a sufficient way be made.

All kinds of injuries to *highways*, that render them less commodious to travellers, are deemed nuisances; such as laying logs of timber in them, erecting gates, or making hedges across them, permitting boughs of trees to hang over them, &c. By stat. 13 Geo. III. cap. 78. no tree or bush is to be allowed to grow or stand within fifteen feet of the centre of the *highway*, on forfeiture of 10s. by the owner. The possessor of land next adjoining shall cut, prune, or plash their hedges, and lop trees growing in or near such hedges, or be liable to a complaint of the surveyor, after ten days notice; and the justices at a special sessions shall order such hedges to be cut or plashed, and such trees to be lopped; and the possessor, who refuses to comply within ten days after notice of such order, shall forfeit 2s. for every twenty-four feet in length of such hedge, and 2s. for every tree; the surveyor shall order the same to be done, and the possessor, before the penalties, shall pay the charges of doing the same, to be levied by distress, by warrant of one justice. The occupiers of such lands shall keep their ditches, drains, and water-courses, in proper order, on forfeiture of 10s. after ten days notice given by the surveyor. No stone, timber, soil, or other matter, shall be laid in the *highway*, so as to obstruct or prejudice it, and remain there five days after notice by the surveyor, on forfeiture of 10s. and if such stone, &c. shall be laid within fifteen feet of the centre of the *highway*, the owner of the adjacent lands, after five days notice, may remove and dispose of the same to his own use. Persons making encroachments on the *highways* by any fence, or breaking up the soil, within fifteen feet from its centre, shall forfeit 40s. to the informer, and the surveyor shall cause the damage to be repaired by the offender; and one justice may levy the penalty and expence by distress. The surveyor is required to give written notice to those who offend in these respects; and if they do not comply within twenty days after such notice, he shall proceed to remove nuisances, &c. to cleanse ditches, &c. and to cut bridges, &c. at the expence of the offender, who shall be liable to forfeit for his neglect one penny for every foot in length. If the *highway* is willfully obstructed by carriages, or implements of husbandry, the person offending shall forfeit 10s.

It is further enacted by the same statute, 13 Geo. III. cap. 78. that no driver of any cart, dray, or waggon, shall ride upon such carriages, without having some person on foot to guide the same, excepting such carriages as are conducted by persons holding the reins of the horse or horses drawing them; or damage or obstruct the passage of any person or carriage in the street or *highway*, or quit the *highway*, or willfully be at such a distance from his carriage, so that he cannot have the government of the horses, &c. drawing the same, or refuse or neglect to make way for loaded carriages; or drive a carriage not having the owner's name, and refuse to discover it, under the penalty of forfeiting any sum not exceeding 10s. if the driver be not the owner of the carriage; and if he be the owner, any sum not exceeding 20s. on conviction by confession, view of the justice, or oath of one witness, before one justice.

Owners of carriages are also required to have their names and places of abode painted in large legible letters on some conspicuous part; and the owner of every stage-wagon, or cart, shall, moreover, have the following words, *common stage waggons*, or *carts*, as the case may be, under the penalty of a forfeiture not exceeding 5s. nor less than 20s. And no ale-houses shall be kept by toll-collectors at any public bridge, under a penalty of 5s. It is also enacted by the same statute, that the justices shall issue their precept to the surveyor, requiring him to erect polls or stones in places where several *highways* meet, with inscriptions on them in large legible letters, containing the names of the towns or chief villages to which the several ways lead; and also in places subject to floods, inscribed with marks denoting the greatest depth of the water; and if he shall neglect or refuse for three months, he shall forfeit 20s. And if any person remove or destroy polls, blocks, banks, &c. let up for the security of horse and foot carterways, or the buttments of bridges, or destroy or even surface any milestone or direction-post, they shall forfeit, on conviction on the oath of one witness, before one justice, or upon view of the justice, a sum not exceeding 5s. nor less than 10s. and on default of payment be committed to the house of correction for any term not exceeding one month, nor less than seven days.

The same statute farther enjoin, that no waggon, the felices of whose wheels are nine inches broad, shall be drawn with more than eight horses, nor carts of the same dimensions with more than five horses; and no waggon, the felices of whose wheels are six inches broad, and rolling on each side a surface of nine inches, shall be drawn with more than seven horses; and no waggon rolling a surface of six inches only, with more than six horses; nor cart, the breadth of whose wheels is six inches, with more than four horses; and no waggon, the felices of whose wheels are of less breadth than six inches, shall be drawn with more than five horses, nor cart of the same breadth with more than three horses; the owner that offends against these regulations shall forfeit 5s. and the driver, not being the owner, 10s. for every horse above the proper number, to the sole use of the informer. But carriages moving upon wheels or rollers, of the breadth of sixteen inches on each side, with flat surfaces, shall be allowed to be drawn with any number of horses. No regulations affecting the number of horses, and wheels of carriages, shall extend to carriages used in carrying one stone or block of marble, cable rope, piece of metal, or piece of timber, or to such ammunition and artillery as may be required for his majesty's service. For all the purposes of this act, two oxen, or horned cattle, shall be considered as one horse.

By the common law, no *highway* can be changed without the king's licence first obtained, upon a writ of *ad quod damnum*. In aid of the common law, and to render the changing of *highways* less troublesome and expensive, power is given by 13 Geo. III. cap. 78. to the justices of the peace to widen, divert, and change *highways*, as they shall judge most convenient. And it is enacted, that the surveyor shall make every public cart-way leading to any market-town twenty feet wide at the least, and every public horse-way or dray-way eight feet wide at the least, wherever the ground between the fences shall admit of it; or on the view of two justices, it shall be widened or diverted at their pleasure, provided that its breadth exceeds not thirty feet, and that no houses or buildings are pulled down, or any garden, park, court, or yard, taken away; and the owners of the ground, which shall be laid into the *highway*, or through which it shall pass, shall be recompensed for it, and every injury redressed. The expences of making, repairing, &c. *highways*, are defrayed by equal assessments, made by a warrant of the justices, at a special sessions, on all occupiers of lands, tenements, woods,

ties, and hereditaments; provided that no such assessment in one year shall exceed six pence in the pound. In extraordinary cases another assessment may be made, provided this and the preceding shall not in any one year exceed the rate of nine pence in the pound.

By the same statute the justices are enjoined to hold a special session for the *high-ways* in the week next after the Michaelmas general quarter-sessions yearly; and notice shall be given to the constables of the respective parishes at least ten days before it shall be held. Surveyors of the *high-ways* are to be chosen yearly out of a list of proper persons, nominated by the householders, assessed to any parochial or public rate, by the justices at their sessions; and their number shall depend on the extent of the parish, &c. But no person is liable to be appointed to serve this office within three years from the time of his having served it, without his own consent. Those who refuse to serve, after having been nominated by the parish and justices, shall forfeit 5*l.* and if they were only nominated by the justices, they shall forfeit 5*sh.* In this case, the justices may appoint a proper person to this office, with a salary not exceeding one eighth part of what shall have been raised by assessment of six pence in the pound for the use of the *high-ways* in the district where the assessment hath been raised; and they shall also appoint one substantial inhabitant of each parish, &c. for assistant to such surveyor, till the next annual appointment, whose refusal incurs a forfeiture of 5*sh.* And if a second person refuse, he shall also forfeit 5*sh.* and a third shall be appointed, with a salary. Special surveyors returned to the justices by two parts out of three of those who have the choice, with a settled salary, may be appointed by them with the said salary. In case of the death of a surveyor, two justices at a special session may appoint another in his stead.

It is the business of the surveyor to preserve *high-ways* in proper repair, &c. For this purpose it is enacted by the statute already cited, that every person keeping a team, draught, or plough, &c. who keeps a wagon, cart, wain, plough, or combe, and three or more horses or beasts of draught, shall fix days in the year furnish one wain, cart, or carriage, and other necessities, and two able men, on the day and place appointed by the surveyor. Those who occupy lands of 50*l.* a year shall do the same; and in like manner for every 50*l.* a year respectively. Those who occupy lands under 50*l.* shall pay to the surveyor, in lieu of the duty, for every 20*l.* annual value of their land, &c. one penny for every day's statute duty, &c. and the same for every 20*l.* above the annual value of 50*l.* and less than 100*l.* Persons keeping a team, but occupying land of the yearly value of 30*l.* shall be obliged to send only one labourer with such team. Persons not keeping a team, but keeping one or more cart or carts, and one or two horses, shall send one labourer with each cart, and persons keeping a wheel-carriage, but no team, nor occupying 50*l.* a year, shall pay to the surveyor 1*sh.* in respect of every day's statute duty, for every horse which he shall use in such carriage. Every inhabitant eighteen years of age, and upwards, but under sixty, not chargeable in any other way for 4*l.* a year, or upwards, and not being an apprentice or menial servant, or not having served or compounded in any other place for that year, shall 5*sh.* in person, or find a labourer, on each of the foresaid days. Carriages shall be charged, at the discretion of the surveyor, for mares, three being allowed for each team, or 4*sh.* 6*d.* shall be paid in lieu of them. Persons liable to perform statute duty may compound at such rates as the justices shall think fit, not exceeding 6*sh.* nor less than 3*sh.* for each team, for each day, or, in default of their adjoining the same, the sum of 4*sh.* 6*d.* for every cart and one horse 2*sh.* for every cart with two horses 3*sh.* in lieu of each day's duty. And every inhabitant liable to perform such duty, and not chargeable in any other respect, may compound for 4*sh.* each day. The surveyor shall give four days notice to those whose attendance is required, and they shall bring with them their own tools, continue at work for eight hours in each of the appointed days; and defaulters in finding a team, &c. shall forfeit 10*sh.* those in sending a cart with one horse and man, 3*sh.* for not sending a cart with two horses and one man, 2*sh.* and for each labourer 1*sh.* 6*d.* Surveyors for neglect of duty, where no particular penalty is imposed, shall forfeit a sum over 5*sh.* not less than 10*sh.* at the discretion of the justices. All defects of repairs of *high-ways* shall be presented in the county where they lie; and the indictment must shew, that they are *high-ways*; also the places from and to which they lead; where the nuisance was done, and how far it extends; it must likewise state the fact clearly. Justices may present on their own view. For the farther regulations relating to *high-ways*, the principal of which have been already recited, the reader is referred to 13 Geo. III. cap. 73.

VOL. II. N^o 171.

High-way, turnpike. See TURNPIKE.

High-way men, are robbers on the *high-way*; for the apprehending and taking of whom, a reward of 40*l.* is given by the statute of 4 and 5 W. & M. to be paid within a month after conviction by the sheriff of the county; to which the statute 8 Geo. II. cap. 16. *supra* adds, that to be paid by the hundred indemnified by such taking.

HIGHNESS, a quality, or title of honour, given to princes.

The kings of England and Spain had formerly no other title but that of *highness*, the first, till the time of Henry VIII. and the second, till that of Charles V. See KING. The petty princes of Italy began first to be complimented with the title of *highness* in the year 1630. And the duke of Orleans assumed the title of *royal highness* in the year 1631; to distinguish himself from the other princes of France.

The duke of Savoy, afterwards king of Sardinia, bore the title of *royal highness*, on account of his pretensions to the kingdom of Cyprus. It is said that the duke only took the title of *royal highness*, to put himself above the duke of Florence, who was called *great-duke*; but the great-duke has since assumed the title of *royal highness*, to put himself on a level with the duke of Savoy.

The prince of Condé first took the title of *most serene highness*, leaving that of simple *highness* to the natural princes.

At present all the sons of crowned heads are styled *royal highness*, as the electors of Germany are called *electoral highness*.

HIGHLY is a name frequently mentioned in our statutes for a person who carries from door to door, and sells by retail, small articles of provisions, &c. They are laid under various restraints by the statute laws.

HILABILA, in *Bison*, a name given by some authors to the tamarind-tree.

HIS *testis*, q. d. *those witnesses* a phrase anciently added in the end of a deed, written in the same hand with the deed; upon which the witnesses were called, the deed read, and then their names entered. See WITNESS.

This clause of *his testis*, in subjects' deeds, continued still, and in the reign of Henry VIII. but it is now omitted. Coke on Littleton.

HILARIA, in *Antiquity*, feasts celebrated every year, by the Romans, on the eighth of the calends of April, or the twenty-fifth of March, in honour of Cybele, the mother of the gods. As is observed by Macrobius, lib. i. cap. 10. and Lampridius, in his life of Alexander Severus.

The *hilaria* were solemnized with great pomp and rejoicing. Every person dressed himself as he pleased, and took the marks or badges, of whatever dignity or quality, he had a fancy for. The statue of the goddess was carried in procession through the streets of the city, accompanied by multitudes in the most splendid attire. The day before the festival was spent in tears and mourning. Cybele represented the earth, which at this time of the year begins to feel the kindly warmth of the spring; so that this sudden transition from sorrow to joy was an emblem of the vicissitude of the seasons, which succeeded one another.

The Romans took this feast, originally from the Greeks, who called it *anagallis*, q. d. *offerings*, the eve of that day they spent in tears and lamentations, and thence denominated it *anagallis*, *desolatio*.

Afterwards, the Greeks took the name *hilaria*, from the Romans; as appears from Photius, in his extract of the life of the philosopher Ildone.

Cassaubon maintains, that beside this particular signification, the word *hilaria* was also a general name for any joyful or festival day, whether public, or private and domestic. But Salmassius does not allow of this.

Tristram, tom. i. p. 432. distinguishes between *hilaria* and *bilaria*. The former, according to him, were public rejoicings; and the latter, prayers made in consequence thereof; or even of any private feast or rejoicing, as a marriage, &c. The public lasted several days; during which, all mourning and funeral ceremonies were suspended.

HILARODI, *hilaria* compounded of *hilaris*, joyful, and *odis*, song, in the *Antient Idyllic and Pæan*, a sort of poets among the Greeks, who went about singing little merry diverting poems or songs; though somewhat graver than the Ionic pieces.

The *bilaria* appeared dressed in white, and were crowned with gold. At first they wore shoes; but afterwards they assumed the crepidæ, which was only a sole, tied over the foot with straps.

They did not sing alone; but had always a little boy, or girl, to attend them, playing on some instrument. From the streets they were at length introduced into the tragedy, as the magdoli were into comedy.

The *hilaria* were afterwards called *Simodi*, from a poet named *Simus*, who excelled in this kind of poetry.

HILARODIA, a poem, or composition in verse, made or sung by a kind of rhapsodist, called *HILARODI*.

HILARO-TRAGEDIA, a dramatic performance, partly tragic or serious, and partly comic or merry.

Scaliger holds the *hilaro-tragedia* and *hilarodia* to be one and the same thing. Others rather take the *hilaro-tragedia* to have been pretty nearly what we call a *tragic-comedy*. Others, again, will have it to have been a pure tragedy, only terminating with a happy catastrophe, which brings the hero out of a wretched into a fortunate state. But the first opinion seems the most probable, and the best warranted.

Suidas mentions one *Rhinthon*, a comic poet of Tarentum, as the inventor of this kind of poem; whence it was also called *Rhinthonia farsula*.

HILARY term. See **TERM**.

HILL. See **MOUNTAIN**.

To find the height of a hill, see the latter part of the article **LIVELINESS**.

HILLIA, in *Botany*, a genus of the *bracteata myrsinacea* class: the calyx is five-leaved; the corolla is very long, and divided into six segments; the fruit is a berry, with two cells, containing many seeds.

HILLOCK. See **MOUND**.

HILUM, a word used by botanists to express the blackish spot in beans, commonly called by us the eye of the bean.

HIMANTOPUS, *long-legged plover*, in *Ornithology*, the name of a water-bird, a species of the *CHARADRIUS* in the Linnæan system, very remarkable for the length and slenderness of its legs; it is all over white, on the breast, belly, and throat, and blackish on the back and wings; its beak is black, about a hand's breadth long, and very weak and slender, fit for nothing but to destroy the softer small insects; its tail is of a whitish grey; its neck has several oblong black spots drawn downwards, and its wings are very long; its legs and feet are red, and have no hinder toe. Aldrovand. de Avib. lib. ix. cap. 30. These birds are extremely rare in the British islands. See *Tol. II. of Birds*, N° 19.

HIMAS. The proper signification of the word *hima* is a *thing of leather*; but in medicine it is used to signify a lamina of the uvula, when it becomes long and slender, and hangs pendulous. It differs from the *crinia*, because in this latter disorder the uvula is not extended, but seems to acquire a greater thickness, as well as length, than what it naturally has.

HIN, a Hebrew measure, containing the sixth part of an ephah; or one wine gallon and two pints.

HIND, a female hog of the third year. See **HUNTING**.

HIND-BERRY, in *Botany*. See **RASPBERRY**.

HIND-CALF, a female part of the third year. She fawns in April and May. Her skin is softer than that of a hart, but not so favoury, and is dressed after the same manner. If it be roasted it ought to be larded, drest in a maitre d'hotel, and moistened while it is roasting. See **HUNTING**.

HIND-BAND, in the *Mangee*. See **HAND**.

HINDENI *hemini*, formed from the Saxon *finden*, a *family* or *company*, anciently signified a society, or class of men.

In the time of our Saxon ancestors, all men were ranked into three classes, or *hindens*; the *lessofs*, the *middle*, and the *higst*; and they were valued according to the class they were in; that in case any injury were done by any one, satisfaction might be made according to the value or worth of the man it was done to.

The *lessofs* were those who were worth ten pounds, or two hundred shillings; called *tri decantini*, or *trigintidenn*, and their wives *tychynidenn*.

The *middle* were valued at six hundred shillings; and were called *sixtydenn*, and their wives *sixtydenn*.

The *higst* were valued at twelve hundred shillings; and were called *hundredtydenn*, and their wives the *hundredtydenn*.

HINDOOS. See **GYRANOES**.

HINE, or *HINN*, in the *Sansk Language*, signifies a servant, or one of the family; but it is now taken in a more restrictive sense, for a servant at hand; and the matter lies in he that oversees the rest.

HINGES, in *Building*, those necessary iron ligaments, by means whereof doors, lids, folds of tables, &c. make their motion, whether of opening, shutting, or folding. The species of hinges are many, viz. *beck*, *box*, *butter*, *calement*, *rolling*, *cheek*, *catch*, *cheek*, *door-latch*, *effe*, *folding*, *gunst*, *weighty*, *side*, *side* with rising joints, *side* with *squares*, *scrows*, *scottle*, *shutter*, *trunk* of *lundy* form, and *hook* and *eye* *hinge*.

HINGWANG, in *Natural History*, a name given by the people of the East Indies to a species of red arsenic,

which they use in painting and in medicine. They find it in and about the copper mines. It is calcined several times, in order to fit it for internal use. In painting, it makes a very fine orange-colour; but when mixed with ceruss, it makes a lemon-colour; and any other shade of yellow. It seems to contain some portion of silver, and some cinnamon.

HINNULARIA, a name given by authors to a species of eagle. See **PYGARGUS**, and *Alutianus* **EAGLE**.

HINNULUS, a hind; the young of the deer or goat kind. The rennet of a young hind or deer, taken within nine days after it is brought forth, is a prescription given by Scribonius Largus for the epilepsy. James's Med. Dict.

HIP, in the *Mangee*. See **HAUNCH**.

HIP, in the *Materia Medica*, the fruit of the cynobates, shrub, wild briar, *hip-rose*, or *rose-rose*.

Hips are agreeably dulco-acid, and hard recommended as cooling, refrigerant, in bilious fluxes, sharpness of urine, and hot indigestions of the stomach; but they are but little used in the shops, except in the conferve, which is a very pleasant one, and made of the fresh pulp, by mixing three ounces of it with five of fine sugar. The pulp should be carefully separated from the rough prickly matter which incloses the seeds; for a small quantity of this retained in the conferve, is apt on occasion to excite acidity at the stomach, pruritus about the anus, and sometimes vomiting. Lewis.

HIP-GRASS, *hyssopus*. See **GOAT** and **SCATIACA**.

HIP-Joint, a disorder of a horse, when he has wrong or sprained his haunches, or hips, so as to relax the ligaments that are to keep the bone in its due place.

The signs are, that the horse will halt much, and go aside-long, trailing his leg after him; and the hip which is hurt will be lower than the other; the flesh falling away on the side of his buttock.

Hips, in *Building*, are those pieces of timber, placed at the corners of a roof.

The hips are much longer than the rafters, on account of their oblique position, and are placed not with a right or square angle, but a very oblique one; and by consequence are not, at least ought not to be, square at any angle (as rafters are all) but level at every one of them; and, which is yet more, as rafters have but four planes, these commonly have five.

They are commonly, by country workmen, called *corners*; some call them *principal rafters*, and others *sleepers*. Indeed, hips and sleepers are much the same; only the sleepers lie in the valleys, and join at the top with the hips; but those surfaces or planes, which make the back of the hips, are the underlies of the sleeper.

The backs of a hip are those two superficies, or planes, on the outside of the hip, which lie parallel, both in respect of their length and breadth, with the superficies of the adjoining sides and end of the roof.

Hip-mould, is by some used for the back of the hip. Others understand it to be a prototype, or pattern, commonly made of a piece of thin waincot; by which the back and the sides of the hip are set out.

Hip-roof, among Builders, called also *Italian roof*, is a roof which has neither gable-head, nor *stern-head*, nor *jirten-head*; which last are both gable and hip at the same end. A *hip-roof* has rafters as long, and with the angles at the foot, &c. at the ends of buildings, as it has at the sides; and the feet of the rafters on the ends of such buildings as have *hip-roofs*, stand on the same plane, viz. parallel with the horizon, and at the same height from the foundation, with rafters on the sides of the roof.

Hip-tyle. See **TYLE**.

HIPPAGOGA, in *Antiquity*, a vessel used in transporting horses. It was otherwise called *hippogon*.

HIPPARCHUS's period. See **PERIOD**.

HIPPELAPHUS, among the *Ancient Zoologists*, was only the name of a large race of flags, with longer hair on the neck giving it the appearance of a mane.

HIPPEUS, or *EQUINUS*, in *Physiology*, a sort of comet which some writers suppose to bear a resemblance in its tail to a horse. But the shape of this kind of comet is not always alike; being sometimes oval, and sometimes imitating a rhomboides. Its train also is sometimes spread from the front or fore-part, and sometimes from the hind-part.

Hence this class of comets is distinguished into *equinus* *horkatus*, *equinus quadrangularis*, and *equinus ellipticus*. See **COMET**.

HIPPATRICE, of *HYPER*, *herse*, and *hypatra*, physician, the art of curing the distiches of brutes, and particularly horses.

This makes what we rather call the *farrier's art*. See **FARRIER**.

HIPPION, or *HIPPION*, in *Botany*, a name by which John Bauhine, and some other authors, have called the larger species of the autumnal dwarf *CARLINA*.

HIPPUM, in *Antiquity*, that part or tract of the *hippodrome*, which was beaten with the horses feet. See *Hippodrome*.

HIPPO, in *Zoology*, the name of a species of *COLUBER*, the fruts of whose abdomen are one hundred and sixty, and the squama of the tail one hundred.

HIPPOBOSCOS, in *Natural History*, the name given by authors to the horse-fly. This is of the signella of the common fly, and has a broad-flat body, which is hard and smooth, and of so firm a structure, that it can scarce be crushed or broken by the fingers. It is remarkable for its flying sideways. See *Horse-swarm*.

This is a genus of the *diptera* class of insects in the Linnaean system.

HIPPOCAMPUS, the *sea-horse*, in *Zoology*, the name of a small sea-animal, caught in the Mediterranean, and esteemed useful in medicine among the ancients, but at present not used. This is a species of the *SYNGNATHUS* in the Linnaean system. See *Tak. II. P. 13. fig. 13*.

It has its name from the Greek *hippos*, a horse, and *campus*, a caterpillar, from its resembling a horse in its head, and a caterpillar in the rest of its body. It seldom exceeds the length of three inches, and is about as thick as a finger, or a little more; its snout is long and hollow like a pipe, and is not split, as in other animals, in general; but it has an operculum from below, which opens or shuts up its aperture at the creature's pleasure; its whole snout is perfectly like that of the acorn or needle-fish; its eyes are round and prominent, and between the eyes there are two more prominent tubercles. The body, down to the anus, is heptagonal, or seven-sided, and terminated at the angles with a sort of thorny protuberances; from the snout to the tail the shape is only three or four-sided, and ends in a point, and is twisted into a sort of spiral line. In the place where the gills of other fishes are situated, this has two fins in the shape of ears; and above these there are two apertures opening upwards, but no gills are any way discoverable. It has two apertures on the belly, out of one of which the excrements are voided, and by the other the female deposits her eggs; its whole body is composed of a sort of annular cartilages, from distinct parts of which are propagated a sort of prickles; it is white fresh of a dusky green colour, and blackish toward the tail, and is spotted principally on the belly with bluish-white specks; it has a single fin in the middle of its back of an equal height all the way. Into whatever pulvis you turn the tail, while the creature is yet living, it will retain it when dead. Some of this species have a mane like that of a horse, but most want this character; and naturalists are not yet determined whether it be the character of a distinct species of the animal, or be owing to the different age or sex. It is hairy in many parts of the body, but principally about the head; but the hairs often fall off in drying the creature. Willugh. *Hist. Pisc. p. 157*.

HIPPOCASTANUM. See *HYSCHYSTUR*.

HIPPOCENTAUR, formed of *hippos*, horse, *centauros*, pangs, *of spurs*, and *tauros*, bull, in *Antiquity*, a fabulous monster, supposed to be half horse and half man. What gave occasion to the fable was, that a people of Thessaly, inhabiting near mount Pelion, became thus denominated, because they were the first that taught the art of mounting on horseback; which occasioned some of their neighbours to imagine that the horse and man made but one animal.

The *Hippocentaurus* should seem to have differed from the *CENTAURS*, in this, that the latter only rode on buffaloes, and the former on horses, as the names themselves intimate.

On the medals of Gallienus is represented a centaur drawing a bow, or holding a globe in the right hand, and the helm of a ship in the left; with this inscription, *APOLLINIS COM. AVG.* To *Apollis* the conqueror of *Angitia*. Trilun considers both the one and the other as a symbol of the protection Gallienus received from Apollo in his wars against the Persians.

HIPPOCETALOIDES, the *horse-head stone*.

The word is derived from the Greek *hippos*, a horse, and *setala*, the horse; and is a name given by Dr. Plot to a stone found in Oxfordshire, and many other places, and supposed to resemble the head of a horse in figure, though the truth is, it requires a very warm imagination to make out the resemblance.

The stone is composed of the matter of the common coarsest quarry-stone, and owes its figure to a shell of the cockle-kind, into which having been received at a time when it was soft and mould, it has taken the exact figure and lineaments of its inner parts. It is about the size of the larger becardine, from an inch and a half to two inches and a half in length, and indeed very much resembles that stone, having been formed wholly in the same manner, and in a shell of the same genus. Hill's *Hist. of Foss. p. 646*.

HIPPOCRAS, *Vinum Hippocraticum*, a kind of medicinal wine.

Menges approves the conjuncture of those who derive *Hippocras* from *Hippocras*, as supposing him the inventor hereof; but we may better deduce it from the *meica Hippocratis*, or *Hippocratis flower*, used in the filtration of it.

Hippocras is a drink composed of wine, with spices and other ingredients infused therein, much used among the French by way of a cordial dram after meals.

There are various kinds of *hippocras*, according to the kind of wine, and the other additional ingredients made use of; as white *hippocras*, red *hippocras*, claret *hippocras*, strawberry *hippocras*, *hippocras* without wine, *cyder hippocras*, &c.

That directed in our late college dispensary, is to be made of cloves, ginger, cinnamon, and nutmegs, beat, infused in canary, with sugar; to the infusion, mull, a lemon, and some slips of rosemary, are to be put, and the whole strained through a funnel. It is recommended as a cathartic, and as good in dyspepsia, and all nervous cases.

HIPPOCRATEA, in *Zoology, a genus of the *primulae nigricans* class. Its characters are these: it has a large spreading calyx of one leaf, cut into five segments; and the flower hath one oval petal, which is entire; it has six slender, short filaments, and an oval germ situated below the petal, which becomes an oblong capsule, winged at the top, including a single seed. We have but one species of this genus, which is a native of Cambray. Miller.*

HIPPOCRATES'S flower, *meica Hippocratis*, a kind of filix, or straining-bag, formed by joining the opposite angles of a square piece of flannel, in form of a pyramid, and used to percolate or strain syrups, decoctions, &c. for clarification.

HIPPOCRATIA, in *Antiquity*, feasts celebrated by the Arcadians in honour of the equestrian Neptune, from a notion that this deity conferred riches on men. During the celebration of them, horses were exempt from all labour, and were led in procession through the streets, superbly harnessed, and adorned with garlands of flowers. The Romans celebrated these feasts under the title of *CONGUALIA*.

HIPPOCRATICA sectis. See *FACIES Hippocratica*.

HIPPOCRATISM, in *Medicine*, denotes the philosophy of Hippocrates, applied to the science of medicine; or the doctrine of Hippocrates considered with regard to the means of prolonging life, of preventing and counteracting the effects of accidents that tend to abridge it, and of maintaining that state of the animal body, which will preserve it from immature dissolution. Hippocrates, who has been justly venerated for more than twenty centuries, as the instructor, and, in a degree, the inventor of the art of healing, was born in the Isle of Cos, one of the Cyclades, about four hundred and forty years before Christ, in the first year of the eightieth Olympiad, according to Soranus, or thirty years before the Peloponnesian war. However, some authors have made him more and others less ancient. He is said to be descended from Esculapius, by Heracles his father, and from Hercules, by Phryne his mother. Hippocrates first joined reasoning to experience in treating of the medicinal art; and on this account he has been always held in veneration as the father of rational medicine. To him we owe the discovery of that principle of the animal economy, which he calls nature, the knowledge of which is so essential to the right conduct of a physician in every branch of his office. Nature is that power, observable in all animals, which directs all the motions both of the solids and fluids for their preservation; to nature, as the governing principle, he ascribes certain faculties, by the mediation of which it selects, retains, and properly prepares what is good and useful in any part of the animal economy, and rejects what is superfluous or hurtful. Nature, according to him, is the true physician that heals all diseases, and that preserves health. This should be invariably consulted in the administration of all remedies; its operations should be aided, and all obstacles removed. Without particular attention to nature, and without recovering its active powers, all remedies are not only useless, but commonly injurious. On these principles Hippocrates applied himself principally to examine the progress of nature in the course of different diseases, as appears from his books *De Morbis*, & *De Affectionibus*; and to describe their symptoms and their prognostics and diagnostics, in such a manner, that they might be known to others as well as to himself. See *7. Aphorismorum*, *Lib. Prognost. Prædict. Febris. Causæ. Lib. de Judicatione*. De *Dieb. Judicator*.

Hippocrates was no less distinguished as the inventor of that part of medicine, which is called *DIECTICA*. Vide *lib. vi. De Dieta*, *lib. De Alimento*, *De Hermodorum Ufu*, *De Salebri Dieta*, *De Victu Acutorum*. In these

works he has evinced the great importance of a proper regimen, both for preserving health, and healing diseases. He has also left several treatises on the subject of anatomy. Vide lib. vi. De Cordis, De Ossium Natura, De Venis, De Homoculis, De Genitura, De Principiis & Carnibus, De Glandulis, De Natura Humana. It appears also from his six books De Articulis, De Fracturis, De Fistulis, De Vulneribus Capitis, De Chirurgia, Officina, that he excelled in surgery: with regard to the materia medica, as far as we can judge from his writings, he made use only of a few remedies, and such as were the most simple. Hippocrates applied his extensive acquaintance with physics for determining the effects produced by the NON-NATURAL on the human body. Vide lib. vi. De Aere, Locis & Aquis; and he was the first who made use of mathematics in explaining the phenomena of the animal economy: and with this view he recommended the study of them to his son Thrasylus. He was no stranger to the doctrine of attraction, and considered the philosophy of Democritus, which he adopted, as of peculiar importance in its reference to the animal economy. The probity of Hippocrates was no less remarkable than his extensive knowledge: an instance of which occurred in his history to this purpose. An infectious disease had infected Persia, and Alexander made the most unqualified offer to Hippocrates to induce him to come and restrain the ravages of this plague; to which he replied, that he could by no means think of giving succour to the enemies of the Greeks. Hippocrates died at a hundred and four years of age, in the three hundred and fifty-sixth year before Christ. He has always occupied in medicine the same kind of distinguished rank as Homer does among the poets, and Cicero among the orators. Galen cites his authority with these words *Magister dixit*. Encyclopædia. See MEDICINE.

The works of Hippocrates are collected in one volume, and published in Greek and Latin by Fæsius. Geneva. 1657.

HIPPOCRENE, derived from *ἵππος*, horse, and *κρήνη*, fountain, q. d. the fountain of the horse Pegasus, was a spring at the foot of mount Hælicon.

HIPPOCREPIS, in *Races*, the name given by Linnaeus to the plant usually called by authors *ferrum equinum*, or the horse-fly root.

HIPPODROME, **HIPPODROMUS**, composed of *ἵππος*, horse, and *δρόμος*, course, of the verb *δρομαι*, curro, I run, in derelict, a hill, or course, wherein chariot and horse-races were performed, and horfes exercised.

The Olympian *hippodrome* or horse-course was a space of ground of six hundred paces long, surrounded with a wall, near the city hills, and on the banks of the river Alpheus. It was uneven, and in some degree irregular, on account of the situation; in one part was a hill of a moderate height, and the circuit was adorned with temples, altars, and other embellishments. See STADIUM. There is a very famous hippodrome at Constantinople, which was begun by Alexander Severus, and finished by Constantine. This circuit, called by the Turks *attarcan*, is four hundred paces long, and above one hundred paces wide. At the entrance of the hippodrome there is a pyramidal obelisk of GRANITE, in one piece, about fifty feet high, terminating in a point, and charged with hieroglyphics. The Greek and Latin inscriptions on its base shew, that it was erected by Theodosius; the machines that were employed to raise it are represented upon it in bas-relievo. We have some vestiges in England of the hippodromes, in which the ancient inhabitants of this country performed their races; the most remarkable is that near STONE-HENG, which is a long tract of ground, about three hundred and fifty feet, or two hundred druid cubits wide, and more than a mile and three quarters, or six thousand druid cubits in length, inclosed quite round with a bank of earth, extending directly east and west. The goal and career are at the east end. The goal is a high bank of earth, raised with a slope inward, on which the judges are supposed to have sat. The meta are two tumuli, or small burrows, at the west end of the course. These hippodromes were called in the language of the country *rhodrai*, the racer rhodrai, and the carriage rhodai, from the British word rhodai, to run. One of these hippodromes, about half a mile to the southward of Leicester, retains evident traces of the old name rhodrai, in the corrupted one of ratolai. There is another of these, says Dr. Stukeley, near Dorchester; another on the banks of the river Lowther, near Penrith in Cumberland; and another in the valley, just without the town of Royston.

HIPPOBOCUS, in *Chronology*, the Boeotian name for the Aethiopian month Hecatombezon, or HECATOMBEZON.

HIPPOGLOSSUS, a species of the PLEUROCTETES in the Linnaean system of Ichthyology, the name of the halibut; a large flat fish caught in the British seas and elsewhere. It is the biggest and the most voracious of all the fish of this kind, and is somewhat of the shape of a turbot, but larger and longer bodied, and consequently less square in back; it is of a slaty brownish green, and beneath it is of a pure white; its scales are extremely small, and the whole surface of the fish very smooth, having no crooked prickles on the sides. The eyes are on the right side, and the belly has six small fins, beside the large straight ones. It is caught in the German and British seas, and its flesh is very coarse, excepting the part which adheres to the side fin, which is extremely fat and delicious, but farcinating. They have been taken in our seas weighing from one to three hundred pounds; but those of a much larger size are found in Newfoundland, Greenland, and Iceland, where they are taken with a hook and line in very deep water. The Greenlanders cut them in large slips, and dry them in the sun.

HIPPOGLOSSUS, *herbstianus*, in *Botany*, the name of a plant of the *rufo*, or butcher's bloom kind, called by others the Alexandrian bay, or *laurus Alexandrina*. See BERTCHIA's *herba*.

HIPPOLAPATHUM, in *Natural History*, a species of lapathum, called also *maek's wispurra*.

HIPPOLITHOS, a name given by some authors to the bones found in the stomachs and intestines of horses; there are sixteen great number of these in one horse; and they are frequently found in the colony of a very large race. See HÆMATA.

HIPPOMANE, in *Botany*. See MARCHENEL.

HIPPOMANES, compounded of *ἵππος*, horse, and *μανη*, madness, a sort of poison, famous among the ancients as an ingredient in antivenereal phlegmas, or chancres. Naturalists are not agreed about the nature of the *hippomani*. Pliny describes it as a blackish carnicle, found on the head of a new-dressed colt, which the dam bites off and eats, as soon as she is delivered. He adds, that if she be prevented herein by any other's cutting it off before, she will not take to, nor bring up her young.

Virgil, and after him Servius and Columella, describe it as a poisonous matter, trickling from the pudendum of a mare, when proud, or longing for the horse. *Æn.* lib. iv. ver. 576.

At the end of Mr. Bayle's Dictionary is a very learned dissertation on the *hippomani*, and all its virtues, both real and pretended.

HIPPOMYRMEX, the *horse-ant*, the name of a species of ant much larger and nimble than the common kind. This builds in woods, and makes its nests of sticks and straw, and fragments of various parts of trees. The common ANT builds only with earth.

HIPPONE, in *Mythology*, the goddess of horfics and chariots.

HIPPOPHAE, in *Races*, the name given by Linnaeus to a genus of plants, called *rhonanidi* by Tournefort and others. See SIDA-*antidoti*.

HIPPOPHEOS. This was a name given not only to the larger species of the phœbe or lichen, but to a very different plant, a kind of dodder, more vulgarly called epipheos, from its growing upon the phœbe, as the dodder of chyme is called epipheos, from its growing upon that plant. It is possible indeed that it might be called originally *hippophæa*, from its rising, as it were, on the phœbe. But however this be, there is great reason to suspect that Dioscorides confounds this dodder with the plant itself, and gives its virtues as those of the proper *hippophæa*, which, according to Theophrastus, and all the other writers of credit in antiquity, is only a larger species of the phœbe, a prickly herb, not a plant, growing on it. See EPITHYMOS.

HIPPOPHthalmic muscles, a name given by the ichthyologists to a pair of large muscles found in the head of fish, one placed immediately under the eyes; these serve to move the eyes; and, with the two maxillary muscles, placed under the jaws, are the principal muscular part of the head of fish.

HIPPOPODES, or *Hippopodes*, compounded of *ἵππος*, horse, and *πῶς*, foot, in the *Ancient Geography*, an appellation given to a certain people, situated on the banks of the Scythian sea; as being supposed to have horfics feet. The *hippodes* are mentioned by Dioscorides, Georg. v. 370. Meib. lib. iii. esp. 6. Pliny, lib. iv. cap. 13. and St. Agelline, De Civit. lib. xvi. cap. 8. But the truth is, that they had this appellation given them on account of their swiftness, or lightness of foot.

HIPPOPOTAMUS, in the Linnaean system of Zoology, a distinct genus of animals of the order of *beluæ*, in the class of *mammalia*, the characters of which are, that it has two jaws fringed in the gums; its dentes incisivi, or cutting teeth, are six above, and four below; others reckon only four in each jaw, and four tusks; the upper ones placed at distances by pairs, the lower ones prominent.

minent, with the middle two the largest; the dog-teeth are single, and seem as if cut off obliquely; the feet are hooved at their margin. There is only one species of this genus, which is called the amphibious *hippopotamus*. This is called in English the river-horse, and by some, though less properly, the sea-horse. It approaches in figure partly to the buffalo, and partly to the bear. It is larger than the buffalo, and second in size only to the elephant, and its legs are very like the bear's. The full-grown male animal is seventeen feet long from its head to its tail, and near five feet in the diameter of its body, and its body is rather flat than rounded; the circumference of its body is usually nearly equal to its whole length, or about fifteen feet; its height near seven feet; the legs near three; the head above three and a half in its girth, and near nine feet; so that its head is very large in proportion to its body, and its mouth is capable of opening a foot wide; its eyes are small, its ears also small and thin; its teeth are as hard as flint, and will readily give fire with flint; it has four toots; the hair on the body is thin and whitish; its hoofs are black, much like those of the common cloven footed beasts, but divided into four claws, unconnected with membranes, instead of two; its upper jaw is movable in the manner of the crocodile's, and it is usually very fat. See Tab. II. *Quadrupeds*, N. 20.

It is found in the Nile and Niger, and many other great rivers; but in none of the rivers which run into the Mediterranean, except the Nile, and only in Upper Egypt, and in the fens and lakes of Ethiopia, through which that river runs. It is a mild and gentle animal, unless provoked, and is capable of being tamed. In the night it leaves the rivers to graze, and does great damage to the sugar-canes, and plantations of rice and millet; it also feeds on the roots of trees, and small fish. It walks slowly, but when pursued, plunges into the water, and walks at the bottom as fast as a fish. When it rises to the surface, with its head out of water, it makes a loud belching; and when wounded, will attack canoes and boats with great fury. In the water these animals are bold, but timid on the land: they are seldom found in the mouths of rivers; they sleep on shoals of sand in the middle of the stream. There are various ways of taking and destroying these animals. In some places the natives lay boards, full of sharp iron, in the corn grounds, which strike into their feet. Others strike them in the water with harpoons, and employ ten or twelve canoes in the chase of them. Sometimes a quantity of peas is laid in their way, which they greedily devour; and thus the animals become immoderately thirsty, and drinking large quantities of water, are blown up and destroyed. The teeth are used by dentists for making false teeth, being less liable to become yellow than ivory. The dried skin is extremely hard, and used for bucklers.

A herd of females has only a single male; they bring one young at a time, on the land, and suckle it in the water. Some have said that the increase of the crocodile in Egypt is promoted by the *hippopotamus*, to which he is an inveterate enemy; but others affirm, that they have seen them swimming together, without any disagreement. There is no mane on the neck, the hair being only thicker on that part; the skin is thick and strong, and of a dusky colour; the tail is about a foot long, taper, compressed, and naked. It is very plainly proved by Bochart, that this is the creature mentioned under the name of *Behemoth*, in the book of Job. Ray's Syn. Quadr. p. 172. and Beccmann.

HIPPOPHOSIS, in the *Writings of the Ancient Physicians*, signifies a reducing any part of the body into its natural situation, by means of compression.

HIPPOSORCHIS, in some dispensatories, a name given to a powder of the testicles of horses.

HIPPOTAURUS, in *Natural History*, the name given by authors to a creature generated between a bull and a mare. It seems a very unnatural copulation; but Wagner, in his History of Switzerland, assures us, that the creature produced by it is sometimes found wild in the mountainous parts of that country.

HIPPURIS, in the Linnaean system of Botany, a genus of plants of the *monandra virginia* class, called by others *limnophora*. The characters of this genus are, that it has neither calyx nor petal; the stigma is simple, and the seed is single, roundish, and naked, or surrounded with no sort of pericarpium.

Pliny has made a great confusion of plants under this name. The ancients called the *hippuris*, or horse-tail, *hippogonum*, on account of its having to many joints in its stalks and branches; this name confounded it with the knot-grass; and Pliny has made a description from the accounts of different authors, which has the characters and qualities of both, and therefore suits neither.

It is easy however to trace his errors; where he speaks of the stalks being naked, rush-like, and brittle, it is plain

that he is speaking of the *horse-tail*; and where he gives it small, oval and pointed leaves, it is equally certain that he means this of the knot-grass; but he adds in one place, that it has a large spreading root, that it grows in woods and shady places, and that it bears a round fruit like a coriander-seed. These are characters belonging neither to the horse-tail nor knot-grass, and might seem to bespeak this *hippuris* a plant different from both; but it rather appears, that Pliny has brought in by an error of his own a third plant, to perplex the case, and to be here transferring some author's account of the Solomon's seal, or polygonum, a name sounding like the word polygonum, and easily mistaken for the same word by a hasty writer as this author appears to have been. He had before erred in his opinion, that the polygonum and horse-tail were the same plant; and here taking the polygonum to be the same plant with the polygonum, he has not scrupled to attribute to the horse-tail whatever he found recorded of the polygonum.

HIPPURIS, is also a name given by Dillenius to the *CHARA* of LINNÆUS, a distinct genus of plants.

HIPPURIS, in Ichthyology, the name of a large sea-fish, the *CORYPHÆA hippuris* of LINNÆUS, with a bifid tail, and six dorsal rays, very much resembling the *alorale* or gold-fish, and by many suspected to be the same species. It is a very remarkable fish, having a sort of erect rising immediately behind its head, which is continued in a long fin to the tail; and there is another in some measure answering this, and reaching from the anus to the tail. It is the quickest of all fish in its growth, which is an observation as old as the time of Aristotle, but is found true to this day. It is caught upon the coasts of Spain, but that only at one time of the year, in the month of August. It is a very delicate and well-tasted fish, and is much esteemed at table. Willughby's Hist. Pisc. p. 233. Gelin de Pisc. p. 301.

HIPPURIS, in the class of *aspidota*, is a species of fish. **HIPPURITES**, in *Natural History*, a name given by some writers to a stone which they fancy to represent a saddle. It is described to be a soft argillaceous stone, owing its figure of a saddle to certain depressions. This is only a lusus nature, and is of the nature of the hand-stones, and foot-stones, with several others, which fancy has added in their resemblance, but which have been very improperly called by that name.

HIPPUS, in *Medicine*, a disorder of the eyes, wherein they continually shake and tremble, and thus represent objects as if continually fluctuating. It is thus called from the Greek, *ἵππος*, horse; because, according to Biancardi, objects appear to fluctuate in it, as much as when we are riding.

HIRA, a word used by the writers in medicine either for the intellum jejunum, or for all the intestine, or in a yet larger sense for all the contents of the abdomen. Cæsar. lex. in voc.

HIRÆA, in Botany, a genus of the *decandria trigynia* class; the characters are, that it has a five-leaved calyx, and roundish unguiculated petals, and three seeds. There is only one species, found in Carthage.

HIRARA, in Zoology, the name of animal in the Brasils much resembling the *NYRANA*.

HIRCUS, *tragus*, or goat, in Anatomy, a part of the auricle, or outer ear; being that eminence next the temples.

HIRCUS, in Astronomy, a fixed star of the first magnitude, the same with *CAPELLA*.

HIRACUS is also a denomination given to the rank smell exhaled from the *erm-pump*, and which has its source in the axillary glands.

HIRACUS is also used by some writers for a COMET, encompassed as it were with a main, seemingly rough and hairy.

HIRGRILL, a name given by some authors to the *serpens*.

HIRQUUS, a name given by some authors to the great catinus of the eye.

HIRTELLA, in Botany, a genus of the *pentandria monogynia* class. Its characters are, that it has five petals, and very long, permanent, spiral filaments; the fruit is a single-seeded berry, and the style is lateral. There is only one species, which is American.

HIRUDELLA marina, in *Natural History*, the name of a very remarkable little animal of the leech kind. The body of this creature is roundish and oblong, and adorned with many longitudinal lines or furrows; it is about an inch in length, and is of a greyish colour, and somewhat transparent; the bowels are seen through the skin, and appear at first light like streaks on its surface; in the middle of the belly there is a remarkable protuberance, which, when closely examined, is found to be a muscular body in form of a spherical bladder; this, when most distended, has the appearance of a spherical air-pump, and has all the properties of that machine, to be employed

played for the service of the animal, and at its pleasure. It resembles, in its common figure, the cup of an acorn, with the mouth a little contracted. The head of the animal, is of the same figure with that of the common leech, and serves to suck the juices of other animals, in the same manner as in that insect. That part of the body which reaches from the head to the middle protuberance is of a very irregular form, frequently in motion, and continually changing its figure; but the other part moves more slowly, and less frequently, and preserves its shape unaltered. The protuberance has two motions, expansion and undulation.

When the creature has a mind to fix itself any where, it does it by means of this protuberance, which it applies closely down to the substance, and void of air. Hence the external air so firmly presses its sides against the substance, that it is not easy to remove it. When the creature changes its place, it draws the head round to the protuberance, and loosens it so as to be able to change its place as it has occasion.

When this creature is kept out of water, it dies in a few hours; and when after being thus kept out a few minutes, it is put into sea-water, it immediately casts out a fine green thread from its mouth; this it usually makes of the length of its body, or thereabouts, though it varies it occasionally; and by means of this it suspends its body any length that it pleases in the water. It seems to be calculated for living only in the bodies of fish, for the sea-water soon kills it; and it is observed to diminish its bulk very sensibly all the time that it is kept in it. Phil. Trans. N^o 170.

HIRUDO, in Zoology. See LEECH.

HIRUNDO, in Ichthyology and Ornithology. See SWALLOW.

HISPANICUM *herba*, Spanish green, a name given by some to *veronica*.

HISPID *huf*, among Botanists. See LEAF.

HISPID *tail*. See STALK.

HISSING, an appellation given by grammarians to the three consonants, *s*, *x*, and *z*.

HISTIODROMIA, the art of sailing, or of conducting vessels on the sea.

The word is composed of *hypo*, *tail*, of *hypo*, the most of a ship, which comes from *hypo*, *hypo*, I stand, and *hypo*, *hypo*, I turn, *hypo*, I turn.

Histiodromia is the time with which we otherwise call navigation.

Histiodromia turns on four points, any two whereof being given, the other two are easily found from them; by the loxodromic tables, lines, tangents, secants, Mercator's chart, &c. These four things are, the difference of latitude, difference of longitude, the course, and the distance run.

HISTORICAL, something that relates to HISTORY.

HISTORICAL *ciencia*. See COLUMN, *historical*.

HISTORICAL *musica*, *musica historica*, is that branch of music which treats of the origin and invention of music, of modes, of notes, instruments, &c. as also the lives and writings of celebrated authors on that subject.

HISTORICAL *style*. See STYLE.

HISTORIOGRAPHER, composed of *hypo*, *history*, and *grapho*, I write, a professed historian, or writer of history; or a person who applies himself peculiarly to it.

The province of the historian is important and extensive; and he, therefore, ought to be endowed with great and uncommon qualifications. Cicero has given us the whole art of composing history in a very compendious and comprehensive manner. No one is ignorant, says he, that the first law in writing history is, not to dare to say any thing that is false, and the next, not to be afraid to speak the truth; that on the one hand there be no suspicion of affection, nor of prejudice on the other.

These fundamental principles are generally known; but the *superstructure* consists partly in things, and partly in the style or language. The former requires an order of time, and description of places. And because in great and memorable events, we are desirous to know first their causes, then the actions themselves, and lastly their consequences; the historian should take notice of the springs, or motives that occasioned them; and in mentioning the facts themselves should not only relate what was done or said, but likewise in what manner; and in treating of their consequences, show whether they were the effects of chance, wisdom, or imprudence. Nor should he only recite the actions of great and eminent persons, but likewise describe their characters. The style ought to be fluent, smooth, and even, free from that harshness and pomposity which are usual at the bar. De Orat. lib. ii. cap. 15.

According to this plan, in the observance of which few are superior to Tacitus, an historian should be not only a man of probity, but free from all passion and bias; he

ought to unite the steadiness of a philosopher with the vivacity of a poet or orator. He should also possess a good judgment, to direct him what is proper to be said, and what to be omitted, and to treat every thing in a manner suited to its importance. Industry is likewise an essential quality of an accurate historian. Thucydides in his History of the Peloponnesian War, and Polybius in his History of the Roman Affairs, took great pains in procuring necessary information. An historian should be always actuated by a love of truth; to this purpose Polybius observes, that a good man ought to love his friends and his country, and manifest a similar disposition with their's, towards both their friends and enemies. But when he takes upon him the character of a historian, they must all be forgot. In history, all personal considerations should be laid aside, and regard be paid only to their actions. Lib. i. p. 13. See also Lucian, De Hist. Senb. p. 366.

Suetonius, Thucydides, and Polybius, are much commended for the integrity and ingenuity of their temper. Cicero observes, *alio loco*, that history is conversant in great and memorable actions; and, therefore, a historian should always keep posterity in view, and relate nothing which may not on some account or other be worth the notice of future ages. Those who descend to trivial and minute matters, which are below the dignity of history, should be deemed journalists rather than historians.

Whenever a prudent historian thinks it necessary, or convenient to take notice of things that are in themselves less considerable, he either does it with brevity, or for some apparent reason, or accounts for it by some just apology. As it is the province of an historian to acquaint us with facts, he should give a narration or description not only of the facts or actions themselves, but likewise of such things as are necessarily connected with them, viz. the characters of persons, the circumstances of time and place, in reference to which chronology and geography have been called the two eyes of history; the views and design of the principal actors, and the issue and event of the actions which he describes. The proper disposition of these various particulars depends on the skill and prudence of the writer. The historian should also introduce pertinent and useful reflections in the course of his narrations. The best historians, such as Sallust and Livy, &c. have allowed themselves this liberty. But the remarks or reflections of the historian should be brief, and differ in this respect from the encomiums or declamations of the orator. Historians have likewise enlivened their narration by introducing, on various occasions, speeches, which are either oblique or direct; the former recited by the historian in his own person. Of this kind is that of Hannibal in Julian, by which he endeavours to persuade king Antiochus to carry the heat of war against the Romans into Italy. Lib. xxxi. cap. 5. And in the latter, the person himself is introduced as addressing his audience; and therefore the words, as well as the sense, are to be accommodated to his character. Such is the speech of Eumenes, one of Alexander's captains and successors, addressed to his soldiers, when they had traitorously bound him in chains, in order to deliver him up to his enemy Antigonus. Justin. lib. xiv. cap. 4.

With regard to direct speeches, there are few ancient historians who have not adopted them, though some of our critics will only admit those which were really spoken by the persons to whom they are ascribed. The first historian who introduced complete and finished speeches into history, is said to be Thucydides, those of Herodotus being but short and imperfect. Letters are sometimes met with in histories, as well as speeches: such are those of Alexander to Darius, in Q. Curtius, lib. iv. cap. 1. and those of Kiberius and Darius in Tacitus Ann. lib. ii. 33. lib. 53. 59. Digressions also, when they are neither too long nor too frequent, may be so managed by the historian, as to afford the reader both delight and profit.

With regard to the order of history, the historian should form his introduction, as to give some general view of the subject, to engage the reader's attention, and to possess him with a candid opinion of himself and of his performance; the latter should be natural, and proportioned to the extent of the work. Such are those of Livy, Herodotus, Thucydides, Tacitus, and others. But order is to be principally regarded in the body of the work: for this purpose the *historiography* should either attend to the time in a chronological series, which is best in biography, after the manner of Plutarch and Cornelius Nepos; in the history of particular places, after Thucydides, Livy, and Tacitus; and sometimes also in a general history: though in this latter case the order of time cannot always be preserved, and therefore the actions of each nation, when several states are independent of each other, must necessarily be separated, in order to prevent confusion. This is the method adopted by Herodotus, Dio-

dorus Siculus, and Justin. For the style of the historian, see *STYLE*.

So numerous and considerable are the qualifications necessary for an historian, that this province was formerly assigned by the eastern nations to a particular order of men; and both among the Greeks and Romans it was generally undertaken by persons of figure, and such as were eminent for learning, knowledge of the world, and other great abilities: and as it is of such singular service to mankind to have the records of past ages well and faithfully transmitted to posterity, it is to be wished that persons of similar character would, in all countries, undertake it. See farther on this subject Ward's *Oratory*, vol. II. lect. 42, 43, 44, and 45.

The term is chiefly used for a person who has a peculiar charge and commission to write the history of his place. The *historiographer* to his majesty is an officer under the lord chamberlain; his salary 2000. per ann. There is an office of the same kind in Scotland, with the same salary.

HISTORY, a recital or description of things as they are, or have been; in a continued orderly narration of the principal facts and circumstances thereof. See *ANALYSIS*. The word is Greek, *historia*; and literally denotes a search of curious things, or a desire of knowing, or even a rehearsal of things we have seen; being formed of the verb *historeo*, which properly signifies to know a thing by having seen it: though the idea appropriated to the term *history* is now much more extensive, and we apply it to a narration of divers memorable things, even though the relater only takes them from the report of others. The origin of the word is from the verb *historeo*, I know; and hence it is, that among the ancients several of their great men were called *poetohistors*, q. d. persons of various and general knowledge.

History is divided, with regard to its subject, into the *history of nature* and the *history of actions*.

HISTORY of nature, or *Natural History*, is a description of natural bodies; whether terrestrial, as animals, vegetables, fossils, fire, water, air, meteors, &c. or celestial, as the stars, planets, comets, &c. See *Natural History*.

Natural history is much the same with what we otherwise call *PHYSIOLOGY*.

HISTORY, with regard to actions, is a continued relation of a series of memorable events in the affairs either of a single person, a nation, or several persons and nations, and whether included in a great or little space of time; or, it is a narrative of such facts as are fit to be transmitted to posterity for the use of mankind and the better conduct of human life. Cicero calls *history* the mistress of life, (*De Orat.* lib. II. cap. 9.) as it teaches us both what we ought to pursue and what we ought to avoid. Thus Thucydides has written the *History* of Greece; Livy, that of Rome; Mexary and F. Daniel, of France; Tyrell, Echard, Rapin, &c. the *History* of England; Buchanan, of Scotland; Clarendon, the *History* of the Rebellion; and Thuanus, bishop Barner, &c. the *History* of their own Lives and Times.

Eusebius, Baronius, &c. have written the *History* of the Church; bishop Barner that of the Reformation, &c. Several authors have written on the Method of reading and studying *History*; among the rest Lucian, Balin, Vossius the elder, Wheat, Parrici, Beni, Mascardi, de Silhon, F. le Moine, F. Rapin, the abbot de St. Real, F. Thomassin, Freney, &c.

History with respect to time, is divided into *ancient* and *modern*, distinguished into several epochs, periods, and intervals.

The three periods of time into which *history* has been divided are the following: viz. the *first*, from the creation to the deluge, which age is reckoned uncertain, because we know no more than the short account given of it in the holy scriptures; the *second*, from the deluge to the first Olympiad, which, from the many feigned stories related in it, is called the fabulous age; the *third*, from the first Olympiad to our own times, is called historical, because the actions done in that period are recorded by writers of true *history*. See *AGE*.

The most ancient of the Greek historians now left is Herodotus, who lived, according to Sir Isaac Newton's Chronology, a hundred and fifty-seven years after the building of Rome. And as to the Romans, Livy himself confesses, that there were scarce any certain memoirs of their affairs till the city was taken by the Gauls, which was above a hundred years later than Herodotus; the accounts before this time having been preserved chiefly by tradition.

History, with respect to its subject, is divided into *universal* and *particular*, *sacred* and *profane*.

F. Menestrier gives us the proper characters of the divers kinds of *history* with great accuracy. He distinguishes

history with regard to both its matter and its form, and gives curious instances of each particular.

History, with regard to its matter, is either *sacred*, or *natural*, or *civil*, or *personal*, or *singular*: to which some have added *artificial history*, giving an account of the origin and progress of arts; and *miscellaneous history*, which relates many various things as they promiscuously occur in human life.

HISTORY, *sacred*, is that which lays before us the mysteries and ceremonies of religion, visions or appearances of the Deity, &c. miracles, and other supernatural things, whereof God alone is the author. Such are the book of Genesis, the Gospels, Apocalypse, &c. See *MIRACLES*, *PROPHETCY*, *REVELATION*, &c.

To this head we may refer *ecclesiastical history*, which gives an account of the rise and establishment of the several religions and churches, of the rise and progress of various opinions, sects, &c. In ancient *sacred history* otherwise called the *history* of the Old Testament, there are seven remarkable periods. The first comprehends 1656 years, from the creation of the world to the deluge; see *SACRED CHRONOLOGY*. The second period includes 857 years, from the deluge to the going forth of the Israelites out of Egypt. The third period begins with the exodus of the Israelites in 2513, extends to the times of the kings, and includes 395 years. The fourth period begins in the year of the world 2909, or from the beginning of the government by kings, and extends to the end of the Babylonish CAPTIVITY, or 3406th year of the world, including 559 years. The fifth period amounts to 372 years, from the year of the world 3468 to the year 3840, or to the times of the MACCABEES. The sixth period begins with Judas Maccabaeus, A. M. 3840, and is continued to the year 3904, or to Herod the Great, comprehending 124 years. The seventh or last period reaches from Herod the Great to the destruction of Jerusalem, or the 70th year after the birth of Christ, containing 106 years.

In more *modern sacred history*, more properly called *ecclesiastical history*, which denotes a clear and faithful narration of the transactions, revolutions and events, that relate to the external and internal state of the Christian church, Dr. Moheim has distinguished four remarkable periods. The first comprehends the infancy and infirmities of the Christian church, from its commencement to the time of Constantine the Great. The second period extends from the reign of Constantine to that of Charlemagne, which produced such a remarkable change in the face of Europe. The third period contains the *history* of the church from the time of Charlemagne to the memorable period when Luther rose in Germany to oppose the tyranny of Rome, and to deliver divine truth from the darkness that covered it. The fourth period reaches from the time of Luther to the present times. On this plan Dr. Moheim's *Ecclesiastical History*, a work deservedly held in great esteem, is divided into four books, containing the *history* of the centuries comprehended by the above periods according to the order of time. See Holberg's Introduction to Universal *History*, translated by Dr. Sharpe, with notes, &c. p. 55, &c. ed. 1758; and Moheim's *Ecclesiastical History*, translated by Dr. Maclean, with notes, &c. ed. 1758, vol. I. p. 12.

HISTORY, *natural*, is a description of the singularities of nature, its irregularities and prodigies, and the alterations it undergoes in the birth, progress, end, and use of things. Such is Aristotle's *History* of Animals, Theophrastus's *History* of Plants, and the entire body of Natural *History* by Pliny; such also are Aeschylus's Natural *History* of the Indies, Plutarch's *History* of Sicily, &c.

HISTORY, *civil*, is that of people, states, republics, communities, cities, &c. Such are those of Thucydides, Halicarnassensis, Livy, Polybius, Moxary, F. Daniel, Milton, Buchanan, &c.

Civil history may be again subdivided into *particular* and *general*: the former consists of a number of facts relating to the same state, suitably connected and laid together in a proper series; Such are Thucydides's *History* of the Peloponnesian War, comprising the events of the first twenty years of that war; Sallust's *History* of the War between the Romans and king Jugurtha in Africa; and Caeser's *History* of his own Gallic and Civil Wars: the latter, or *general history*, is made up of several particular *histories*, whose separate transactions within the same period of time, or part of it, should be so distinctly related as to cause no confusion; such are those of Diodorus Siculus, of Herodotus, of Justin, of Xenophon, and of Polybius, among the ancients; and Thuanus's *History*, Lord Lyttelton's *History* of Henry II. Dr. Robertson's *History* of Charles V. &c. among the moderns.

Civil history, in its more unlimited extent, is denominated *universal history*.

HISTORY, personal, is that which gives the portrait or life of some single person. Such are the Lives of Plutarch, Cornelius Nepos, Suetonius, &c. and the Lives of the painters, philosophers, saints, &c.

Personal history is the same with that we otherwise call **BIOGRAPHY**, and may be denominated *literary history*, as it records the lives and productions of learned men, the controversies that subsisted amongst them, and the rise and advancement of sciences.

HISTORY, singular, is that which describes a single action, siege, battle, or even a war or expedition, &c. Such was the Conspiracy of Catiline to subvert the Roman State, written by Sallust.

History, with regard to its form, is either *simple*, or *figurative*, or *mixed*.

HISTORY, simple, is that delivered without any art or foreign ornament; being only a naked and faithful recital of things, just in the manner and order wherein they passed. Such are the Chronicles of the Eastern Empire, the Fasti, Chronological Tables, Journals, &c.

HISTORY, figurative, is that which is further enriched with ornaments, by the wit, ingenuity, and address of the historian. Such are the political and moral *Histories* of the Greeks, Romans, and most of the moderns.

This latter is a kind of *raiment history*, which, without stopping at the shell or outside, the appearances of things, discovers the secret springs and movements of the several events; it enters into the thoughts, the breasts of the persons concerned therein; it discovers their intentions and views; and, by the result of enterprises and undertakings, discovers the profusion or weakness wherewith they were aided, conducted, &c. There are much the most useful and entertaining *histories*. To this class may be particularly related the *Histories* and Annals of Tacitus, among the ancients; and those of Guiccardin, Thuanus, and Hilhop Barner, among the moderns.

HISTORY, mixed, is that which, beside the ornaments of *figural history*, calls in the proofs and authorities of *simple history*, furnishing authentic memoirs, or original letters, manifestoes, declarations, &c. to vouch the truth of what is said. Such are *Histories* or Collections of Rushworth, M. Rapin Thoiras's *History* of England, the Genealogical *Histories* of Duchesne, M. De Marca's *History* of Berne, &c.

HISTORY is also used for a ROMANCE, or a fabulous but probable relation of a series of actions or adventures feigned or invented by the writer. Such is the *History* of the Civil Wars of Granada, the *History* of Don Quixote, the *Ethiopic History* of Heliodorus, &c.

HISTORY, in Painting, denotes a picture composed of divers figures or persons, representing some transaction or piece of history, either real or feigned.

Painters are distinguished into portrait painters, flower and fruit painters, painters of beasts and landscapes, and *history* painters. The first place is universally allowed to *history* painters, as the most difficult, masterly, and sublime province.

HISTORIO, in the *Ancient Drama*, signified an actor or comedian; but more especially a pantomime, who exhibited his part by gestures and dancing.

Livy informs us, that the *histories* were brought to Rome from Etruria, in the year of the city 391. Dec. i. lib. 7.

HISTRIX. See PORCUPINE.

HITCH, on *Ship-board*, a word denoting a sort of knot or noose, by which one rope is fastened to another, or to some other object, and hence used for catching hold of any thing with a hook or a rope, and to hold it fast. Thus, when the boat is to be hoisted in, they say, *hitch the tackle into the rings of the boat*; and, when about to weigh anchor, *hitch the fish-hook to the fluke of the anchor*.

HITCHHILL, the flame with MATCHES.

HITCHING, in *Horsemanship*, is to wriggle or move forwards by degrees, or to knock the legs together in walking.

HIVE, *Bee-hive*, in different places and on different occasions, are of very different materials. In some places the hollow trunk of a tree serves the purpose; in others they are made of four boards nailed together in the shape of a long box, and placed with one end upon the ground, or upon a frame of wood-work erected for that purpose. The most usual form of them, however, is conic and bell-shaped; and the common materials of which they are made are twisted osier or straw, nicely matted together, and made into a sort of thick cords, bound round with other-bark. The last is the most common kind, and serves perfectly well for all the purposes of the bees, and of the persons who make their profits of the honey. The lodgment is sufficiently warm and close for the bees, and a thin frame of boards defends it from being injured by the wet. But persons of speculative dispositions have

at all times been desirous of seeing what passed in the *hive*, and of observing these industrious insects at their work: for this purpose the ancients contrived a method of placing certain squares or panes of a transparent matter, such as horn, or the lapin specularis, or tingslafs, in some parts of the sides of the *hive*, through which they might see all that passed within. This is mentioned by Aristotle, Pliny, and others; but it soon sunk into disuse, and in later ages it has been supposed to be an idle attempt. Moulart, in particular, ridicules it, and says, that the bees within would immediately spoil the transparency of any material thus employed.

This practice of the ancients seems to have been first revived in our country by Mr. Jeddie, who, in the year 1663, published his invention of boxes for preserving the lives of bees, and obtained a patent from King Charles. These were improved by Joseph Warden, physician at Craydon, who enriched his account of the structure and use of these boxes, with several other curious circumstances concerning bees, in his work entitled *The true Amazons, or the Monarchy of Bees*. But this method was far from being generally known in the year 1680, since Swammerdam seems to have been altogether unacquainted with it; and to this we are to impute the imperfections of that author's account of bees, because, though a most accurate and faithful writer, he had no opportunities of seeing what has been since discovered with this advantage.

Of late, however, this invention has been commonly practised. A transparent sort of *bee-hive* may easily be made, by leaving certain squares in a wooden hive open, and afterwards fastening clear glass in these vacant spaces: a frame of wood may cover the whole, so that the light is not always let in upon the bees, and the covering may be removed when the observer is to examine their operations. By this means it is found, that the squares of glass, when properly placed, will keep clean and transparent for many years; and when they are soiled, there are easy methods of cleaning them, by taking them out and replacing them when they have been wiped. When the observer places himself behind the *hive*, and has one of these squares of glass before his eye, he sees easily all that passes within, without incommoding or interrupting the creatures at their work. These glass *bees*, however, are chiefly objects of curiosity, though, in some instances, they have led to discoveries that must gradually contribute to the improvement of the economy of these useful insects.

The principal advantage derived from *bees* of modern construction, is that of obtaining the honey and wax without recurring to the barbarous expedient of destroying the bees. In the common method, a hole is dug near the *hive*, (generally in the month of September,) and a flick, at the end of which is a rag that has been dipped in melted brimstone, is fixed in the hole; and when the rag is set on fire, the *bees* are immediately put over it, and the earth thrown up round it, so that none of the smoke can escape, and thus the bees are inhumanly and needlessly destroyed. The heaviest and lightest *bees* are treated in this manner; the former, because they yield the greatest profit, with an immediate return; and the latter, because the bees in them would not be able to survive the winter. Those *bees* which weigh from fifteen to twenty pounds are thought to be the fittest for keeping.

The method of preserving the lives of bees has been brought to a considerable degree of perfection by the late Mr. Thomey of Oxfordshire, and Mr. White of Suffolk. Mr. Thomey, who takes the lead in this improvement, professes himself to *bees* for the following reasons: 1. The more certain preservation of many thousands of these useful insects. 2. Their greater strength, consisting in their number, and their corresponding security from robbers. 3. Their greater wealth, arising from their united labours.

To this purpose he tells us, that he has, in some summers, taken two boxes filled with honey (most of it being pure virgin honey of the best kind) from one colony, and left sufficient store for their maintenance; and to these advantages, the pleasure of viewing *bees*, with the greatest safety, at all seasons, even in their busiest time of gathering, and their requiring a much less attendance in swarming time. The bees thus preserved are also more effectually secured from wet and cold, from mice, and other injuries.

Mr. Thomey's boxes are made of deal, which, being spongy, sucks up the breath of the bees (some think a more solid wood would do; and yellow deal, being more roughly seasoned, he says, is the best).

The best form of these boxes is an octagon, which, being nearer to a sphere, allows the bees in winter to live in a round body near the centre of the *hive*; and thus a due heat is conveyed to all the exterior parts, so that the honey is kept from candying. The dimensions, which

he recommends, after long trial, are ten inches deep in the inside, the top-board a full inch, and the breadth within twelve or fourteen inches. He has tried boxes containing a bushel or more, but found them not to answer the design like those of a less size. The top of the box should be made of an entire board, or of two boards well glued together, which should be a full inch thick after it has been planed, and project on all sides at least an inch beyond the dimensions of the box. In the middle of this top there must be a hole five inches square, for a communication between the boxes; and this hole should be covered with a sliding shutter of deal or elm, running easily in a groove, over the back window. The eight panels, nine inches deep, and three quarters of an inch thick when planed, are to be let into the top, so as to keep them in their proper places; to be secured at the corners with plates of brass, and to be cramped with wires at the bottom, in order to keep them firm. There should be a glass window behind, fixed in a frame, with a thin deal cover, two small brass hinges, and a button to fasten it: this window will serve for inspecting the state and operation of the bees. Two brass handles, one on each side, are necessary to lift up the box; these should be fixed in with two thin plates of iron, near three inches long, so as to turn up and down within the box, and put in three inches below the top-board, which is nailed down close with springs to the other parts of the box. Those who chafe a frame within, to which the bees may fasten their combs, need only use a couple of deal sticks, of an inch square, placed across in the box, and supported by two pins of brass, one an inch and a half below the top, the other two inches below it; by which means the combs will quickly find a stay. There must also be a passage, four or five inches long, and less than half an inch deep, for the bees to go in and out at the bottom of the box.

The boxes, thus prepared, should be kept in a house or under a shed, the disposition and structure of which Mr. Thortley has particularly described. He also recommends to paint the apertures of the boxes, which are the habitations of the several colonies, with different colours, as red, white, blue, yellow, &c. in form of a half moon or square, that the bees may the better know their own home. For the method of furnishing these colonies with inhabitants, see *HIVE*.

Mr. Thortley, son to the above mentioned gentleman, has, by long experience, improved his father's method of managing bees. The *bee-hive* of his construction, presented to the Society of Arts, &c. is exhibited in *Tech. Agriculture*, &c. fig. 3.

The bottom part, marked *a*, is an octangular bee-box, made of deal boards, about an inch in thickness, the covernet which is externally seventeen inches in diameter, but internally only fifteen and a half, and its height ten inches. In the middle of the cover of this octangular box is a hole, which may be opened or shut at pleasure, by means of a slider *d*. In one of the panels is a pane of glass, covered with a wooden door *e*. The entrance *f*, at the bottom of the box, is about three and a half inches broad, and half an inch high. Two slips of deal, about half an inch square, cross each other in the centre of the box, and are fastened to the panel by means of small screws: to these slips the bees fasten their combs. In this octangular box the bees are housed, after swarming, in the usual manner, and there suffered to continue till they have built their combs and filled them with honey, which may be known by opening the door, and viewing their works through the glass pane, or by the weight of the hive.

When the bee-master finds his laborious insects have filled their habitation, he it to place a common *bee-hive* of straw, represented at *b*, made either flat at the top, or in the common form, on the octangular box, and drawing out the slider, a communication will be opened between the box and the *straw-hive*; in consequence of which the bees will fill this *hive* also with the product of their labours.

When the *straw-hive* is well filled, the slider may be pushed in, and the *hive* taken away, and another placed in its room, with the slider drawn out. This new *hive* will also be filled in the same manner.

By proceeding in this method, Mr. Thortley assured the society, that he had taken three successive *hives* filled with honey and wax, from a single *hive*, during the same summer, and that the food still remaining in the octangular box was sufficient for the support of the bees during the winter. He adds, that if this method was pursued in every part of the kingdom, instead of the cruel method of destroying these useful insects, he is persuaded, from long experience, that wax would be collected in such plenty, that candles made with it might be sold as cheap as those of tallow are sold at present.

VOL. II. N° 172.

Mr. Thortley has also added another part to his *bee-hive*, which cannot fail of affording the highest entertainment to a curious and inquisitive mind. This part consists of a glass receiver eighteen inches high, eight inches in diameter at the bottom, and in the greatest part thirteen; this receiver has a hole at the top, about an inch in diameter, through which a square piece of sheet is extended nearly to the bottom of the vessel, having two cross-bars, to which the bees fasten their combs. Into the upper end of this square piece is forced a piece of brass, which serves for a handle to the receiver of glass *hive*. When the bees have filled their *straw-hive*, which must have a hole in the centre covered with a piece of tin, Mr. Thortley places the glass receiver upon the top of the *straw-hive*, and draws out the piece of tin. The bees now finding their habitation enlarged, pursue their labours with such alacrity, that they fill this glass *hive* likewise with their stores; and as this receptacle is wholly transparent, the curious observer may amuse himself with viewing the whole progress of their work. It will, however, be necessary to cover the glass with an empty *hive* of straw, or at least with a cloth, which may be easily removed when the bees are inspected, lest too much light prevent their working. In this way Mr. Thortley, in a good season, has had a glass filled in thirty days, containing thirty-eight pounds of fine honey.

When the glass is completely filled, slide a tin plate between the glass and the *straw-hive*, so as to cover the passage, and in half an hour the glass may be taken away with safety. The few bees that remain will readily go to their companions.

Mr. Thortley has added a glass window to his *straw-hive*, in order to observe the progress of the bees; and this contrivance is useful, especially if one *hive* is to be removed while the season continues favourable for their collecting honey; for when the combs are filled with honey, the cells are sealed up, and the bees forsake them, and reside mostly in the *straw* in which their works are thickly carried on. Observing also, that the bees were apt to extend their combs through the passage of communication into the upper *hive*, which rendered it necessary to divide the comb when the upper *hive* was taken away, he puts in that passage a wire screw or netting, the meshes of which are large enough for a loaded bee to pass easily through them; and thus he prevents the junction of the combs from one box to the other, and consequently obviates the necessity of cutting them, and of spilling some honey, which running down among a crowd of bees, incommoded them much.

Mr. White, in his directions for making the bee-boxes of his invention, tells us, speaking of the construction of a single box, that it may be made of deal, or any other well-seasoned boards, which are not apt to warp or split. The boards should be near an inch thick: the figure of the box square, and its height and breadth nine inches and five eighths every way, measuring within. A box of these dimensions will contain near a peck and a half. The front part must have a door cut in the middle of the bottom edge, three inches wide, and near half an inch high. In the back part a hole must be cut with a rabbit in it, in which it is to be fixed, with putty, a pane of the clearest and best crown-glass, about five inches long, and three broad; and let the top of the glass be placed as high as the roof within-side, that the upper part of the combs may be seen; and thus the state and strength of the bees may be judged better of than if the glass were fixed in the middle. The glass must be covered with a thin piece of board, as a shutter, which may be made to hang by a string, or turn upon a nail, or slide sideways between two mouldings. The glass may be made large, or another pane of glass may be fixed on the top and covered with a shutter, for the convenience of observing the bees at their work. The side of the box, which is to be joined to another box of the same form and dimensions, as it will not be exposed to the external air, may be made of a piece of flt-deal, not half an inch thick. This Mr. White calls the side of communication, because it is not to be wholly inclosed: a space is to be left, or cut at the bottom through the whole breadth of the box, and a little more than an inch in height, and a hole or passage is to be made at the top, three inches long and more than half an inch wide. Through these the bees are to have a communication from one box to another. In the next place, a loose board is to be provided, which board is to be half an inch thick, and large enough to cover the side of communication; and likewise several little iron staples, an inch and a half long, with the two points or ends bending down more than half an inch; the use of this part of the apparatus will appear under the article *HIVING*. Moreover, let two Ricks be fixed in the box transversely and crossing each other, in order to be a stay to the combs; one about

three inches from the bottom, and the other at the same distance from the top; and when the whole is painted, in order to render it more durable, the box is finished. This box, says the inventor, is as plain as possible: it is little more than five square pieces of board nailed together; so that any poor cottager may make his own boxes, without the help or expense of a carpenter.

The other box must be exactly of the same form and dimensions; and the two boxes differ only in this, that the side of communication of the one must be on the right hand, and of the other on the left. The two boxes with their openings of communication, ready to be joined to each other, are represented in *Tab. Agriculture*, &c. fig. 4. In fig. 5 is exhibited the front of a frame for twelve colonies; *a, a*, are two cells of oak, lying flat on the ground, more than four feet long: in these cells are fixed four osen posts, about the thickness of such as are used for drying linen. The two posts *b, b*, in the front, are about six feet two inches above the cells; the other two, standing backward, five feet eight inches. You are next to nail some boards of fit deal horizontally from one of the fore-posts to the other, in order to fence the bees from the sun: let these boards be seven feet seven inches in length, and nailed to the inside of the posts, and be well seasoned, that they may not shrink or gape in the joints: *c, c*, are two slips of deal to keep the boards even, and to strengthen them.

Fig. 6 represents the back of the frame: *d, d, d, d*, are four strong boards of the same length with the frame, on which the boxes are to be placed: let the upper side of them be very smooth and even, that the boxes may stand true upon them, or it may be more advisable to place under every pair of boxes a smooth thin board, as long as the boxes, and about a quarter of an inch wider. The bees will soon flatten the boxes to this board in such a manner, that you may move and weigh the boxes and board together, without breaking the wax or resin, which, for many reasons, ought to be avoided.

These floors must be supported by pieces of wood or bearers *e, e*, &c. which are nailed from post to post at each end: they are likewise to be well nailed to the frame, to keep them from sinking with the weight of the boxes. *f* represents the roof, which projects backwards about seven or eight inches beyond the boxes, to shelter them from the rain.

You have now only to cut niches or holes in the frame over against every entrance into the boxes, as *h, h, h*, fig. 5, let these niches be near four inches long, and under each nail a small piece of wood for the bees to light upon. The morning or evening sun will shine upon one of both ends of the frame, let its aspect be what it will, but you may prevent its over-heating the boxes, by a loose board set up between the posts, and kept in by two or three pegs.

In order to take away part of the honey, without destroying or much disturbing the bees, Mr. White advises to examine the state of the colonies about the latter end of August through the glasses; and he observes, that such as have filled a box and a half with their works may spare the half box; but the honey-comb should be particularly examined, and about eight or nine pounds left for their winter store. When this is done, open the mouth of the box you intend to take; then, with a thin knife, cut through the resin with which the bees have joined the boxes to each other, till they are separated; and, after this, thrust a sheet of tin gently between the boxes. The communication being thus stopped, the bees in the fullest box, where most probably the queen is, will be a little disturbed; but those in the other box, where there is no queen, will be in the utmost confusion, running to and fro with a kind of a mournful cry, and lifting out at the newly opened door in great disorder; however, when they have got abroad and discovered their companions, they eagerly join them at the mouth of the other box. By this means, in a hour or two, you will have a box of pure honey, without a living bee to molest you, or any dead bees to waste and damage the honey.

Mr. White's boxes are convenient for feeding poor flocks in order to preserve them, and also for removing moths and insects from any colony that is in danger of being injured by them.

Mr. Wildman recommends the following method of taking the wax and honey without destroying the bees: remove the *hive*, from which you would take the wax and honey, into a room, into which little light is admitted; invert the *hive* gently, placing it on any support, and cover it with an empty *hive*, keeping the side next the window of the empty *hive* raised a little, to give the bees sufficient light to find their way into it: while you hold the empty *hive* steadily supported on the edge of the full *hive*, between your side and your left arm, keep striking with your hand all round the full *hive* from top to bottom,

in the manner of beating a drum, so that the bees may be frightened by the noise, and mount out of the full *hive* into the empty one. As soon as all the bees are out of the full *hive*, which will generally be in about five minutes, the other *hive*, in which they are collected, must then be placed on the stand from which the full *hive* was taken, in order to receive the absent bees as they return from the fields.

If this be done early in the season, the operator should examine the royal cells; for if any of them contain young bees, they, as well as all the combs that have young bees in them, must be preserved in the *hive*. Take out the other combs with a long, broad, and pliable knife, cutting them from the sides and crown as clear as possible, to prevent the future labour of the bees, who must lick up all the honey spilt, and remove every grain of wax. The sides of the *hive* should then be scraped with a table spoon, to clear away what was left by the knife.

Having thus taken the wax and honey, let a table, covered with a clean cloth, be placed near the stand, and giving the *hive* in which the bees are a sudden shake, striking at the same time with a considerable degree of force, the bees will be shaken on the cloth. Put their own *hive* upon them immediately, raised a little on one side, that the bees may the more easily enter; and when all are entered, place it on the stand as before. If the *hive*, in which the bees are, be turned uppermost, and their own *hive* placed over it, the bees will immediately ascend into it, especially if the lower sides be struck to alarm them; for the effects of fear, impressed on the bees by the continual noise, renders them for a considerable time so mild and tractable, that they will bear any handling, which does not hurt them, without any signs of resentment.

Mr. Thorley objects to the method of driving bees, in order to obtain their honey, because the honey will be foul and corrupted, and great numbers of the young brood will thus be utterly destroyed, and the flocks much reduced and endangered. See on the subject of this article, Thorley's Inquiry into the Nature, Order, and Government of Bees, 1774; White's Collateral Bee-Boxes; Wildman, &c. on Bees.

Hive drifts, a name sometimes given to crude or rough wax. See WAX.

HIVING, the placing a swarm of bees in a hive, in order to have the profit of their labour. When the swarm of bees has left an old hive, and is placed in form of a cluster hanging down from the branch of some shrub or low bush, the *hiving* is extremely easy, and may be done in half an hour, after the time of their being still and calm in the cluster; or it may be let alone till an hour or two before sunset, provided that the sun do not shine too vehemently upon the place where they are, for that would disquiet them, and force them to rise; and, in that case, they usually take a long flight before they settle again, and are very often lost: this, however, may at any time be prevented, by placing an artificial fence before them, composed either of coarse cloth, or of a few branches of trees well covered with leaves.

It is commonly the branch of some shrub or tree that they settle upon; and we always find that they mean this as their settled habitation; for, however soon they are hived, the rudiments and beginnings of combs are found on it. It is true, they always leave these places, if left to themselves, in five or six days; but this is not till they find them to be inconvenient that they cannot keep them, either from their being too much scorched by the sun, or exposed to winds and rain. The quantity of wax and honey left in these places, when they have quitted them, abundantly proves, however, that they had meant them for their fixed abode.

When they are placed in a hive, they very soon find themselves much better lodged than in the place they had provided for themselves; and they usually stay in it, and begin to work the next morning.

It might appear a very difficult task to get a large number of bees into a hive, but it is much less so than it appears to be. They will often take possession of the face of their own accord, when it is hung over them; but the shortest way is to hold the hive under the branch where they are, and then sweep them down into it. This may be done with a branch of a tree, with its leaves on it, with the hand, armed with a strong glove, and the face covered. But there are country fellows who will do without any sort of defence, and with their naked hand sweep them carefully off the bough into the hive, when they hold in the other hand underneath.

It is not to be expected that the whole swarm will be thus swept peaceably into the hive; many will fly away, and many clusters will fall beside the hive to the ground. All this, however, creates no difficulty; for the hive being turned bottom upwards, and set on the ground near the tree,

tree, with its edges a little raised above the surface, those bees which fell in clusters to the ground will soon crawl to their companions in the hive, and soon after, those which flew off will descend and follow their example.

If it happen, however, that some bees will obstinately keep to the place where they at first fixed themselves, the branch is to be rubbed over with the juice of such plants as these creatures hate the smell of, such as elder, rue, and some others. And if this does not succeed, there must be linen rags burnt under them, the smoke of which will soon drive them off, and make them join their companions, who find themselves more at ease in the hive.

As it is necessary to render the places disagreeable to the bees from which they are to be taken into the hive, to many people think it very proper to prepare the bees for their reception, by feeding it with such things as they love the smell of. To this purpose they rub the inside of it with hain and bean-flowers, and daub a little honey in some parts of it. This, however, does not seem necessary, those bees having been found to succeed full as well where it was not done as those where it was. Reaumur's Hist. Inf. vol. x, p. 302.

If it be about noon that the swarm is taken into the hive, it must not be removed from the place before evening; and in the mean time it must be sheltered from the too violent heat of the sun by the shade of the trees; or, if that be not sufficient, a sort of green mat be made for it, either of a coarse cloth properly supported, or of branches of trees with their leaves on. In this manner it must remain till ten or eleven, and then the hive must be gently lifted up, and carried to the place where it is to remain, and the next morning the bees will be seen as busy in their work in it, as the old swarm in their hive. See HIVE.

It sometimes happens that the swarm is not placed to favourably as in the instance before mentioned; they often hang themselves in a long cluster from the young shoots of small branches of high trees; and in this case many different expedients are to be used to give them, according to the circumstances of their position. The common method is for one man to climb the tree with a long staff in his hand, and another to mount a ladder placed against the tree, and hold the hive under the swarm, while the other sweeps them into it with the staff; and when the bough on which they hang is so far from the body of the tree that this is impracticable by the ladder, the hive is to be fixed to the end of a long pole, and by that means suspended under the swarm while they are swept into it. When all this is impracticable, because of the great height of the branch on which the swarm hangs, a large cloth is to be spread on some of the lower branches, and the whole swarm swept down in a cluster upon it; this is then to be thrown carefully to the ground, and another person is to be ready there to place the hive over the greater part of the cluster, and the rest will usually soon creep in and join them. If they are slow in doing this, they are to be driven in by burning linen rags about the places where they fly, the disagreeable smell of which will send them towards the hive, where, finding their companions not incommenced with it, they will naturally remain.

Another method of getting a swarm from a branch of a high tree, is to cut off the branch with a saw, as gently and with as little disturbance to the bees as possible. In this case, when the branch is off, a man may carefully descend with it, and the bees will not quit their hold but will be all carried where he pleases with it, and may by that means be very easily put into a hive.

Sometimes the bees, which go out in a swarm, fix upon a hole in a wall, or a hollow in the trunk of a tree, for the assembling themselves. This is a much better choice for them than the branch of a tree, but it is much worse for the person who is to give them, for they are very difficult to be got out of these places. The common way of the country people is to attack these swarms in the middle of a cold night, and they then enlarge the opening from without, and placing the hive under it scoop the bees out of their nest with a ladle, and put them into the hive.

Mr. Thorey tells us, that the best time to plant colonies of bees is either in March or April with new stocks, or in May or June with swarms. If swarms are used, procure, if possible, two the same day, and put them together in two boxes, or in a hive and a box; at night place them in your house, and with a knife and a little lime and hair, stop close the mouth of the hive or upper box, so that not a bee may be able to go in or out, except at the front door. If boxes are employed, you will, in a week or ten days, see the combs appear in them; but in a hive nothing can be observed till the bees have wrought down into the box. Never plant a colony with

a single swarm, as Mr. Thorey says he has sometimes done, but with little success.

When the second box, or the box under the hive, appears full of bees and combs, it is a proper time to raise the colony in the dusk of the evening, which should be done in the following manner: place your empty box with the sliding shutter drawn back, behind the house near the colony that is to be raised, and at nearly the height of the floor, by the help of another empty box upon the ground; then lifting up the colony with as much expedition as possible, set it down upon the empty box, with the aperture of the colony close to the piece of wood nailed upon it, so that no single bee may get out: when this is done, lift the hive and two boxes, or the three boxes, into the house again, putting them in their proper place.

Mr. Thorey farther adds, that the most effectual method of preserving bees in common hives is incorporation, or uniting two stocks into one, by the help of a peculiar smoke or opiate, which will put them entirely in your power for a time, so that you may dispose of and distribute them at pleasure. The queen, in this operation, is immediately to be searched for and detained. Hives or stocks, which have swarmed once or twice, and are consequently reduced in their numbers, are the fittest to be joined together, as they will be thus greatly strengthened and improved. However, if you have a stock both rich in honey and full of bees, you may take it, by dividing the bees into two parts, and putting them into two other hives instead of one. But be careful to examine, whether the stock to which you design to join the bees of another has honey enough to maintain the bees of both; for which purpose it should be full twenty pounds in weight.

The stupefying fume used in this process is the fungus maximus or pulverulentus, or larger mushroom, commonly known by the name of bunt, puffball, or frog-chicla: it is as big as a man's head or bigger; when ripe, it is of a brown colour, turns to powder, and is exceeding light. Put one of these pucks into a large paper, pressing it to two thirds or nearly half its bulk, and tying it very close; then place it in an oven some time after the household bread is drawn, and let it remain there all night; when it is dry enough to retain fire, it is fit for use in the following manner: cut off a piece of the puck as large as a hen's egg, and fix it in the end of a small stick fit for the purpose, and sharpened at the other end, and place this so that it may hang near the middle of an empty hive; this hive must be left with the mouth upward, in a pail or bucket, near the stock you intend to take: then set fire to the puck, and immediately place the stock of bees over it, tying a cloth round the hive that no smoke may escape. In a little while you will hear the bees fall like drops of hail into the empty hive. You may then beat the top of the hive gently with your hand, to get as many of them out as you can: after this loosening the cloth, lift off the hive to a table, knock it several times against the table, and several more bees will tumble out, and perhaps the queen among them; she is often one of the last that falls: if she is not there, search for her among the main body in the empty hive, spreading them for this purpose upon a table. You must proceed in the same manner with the other hive, with the bees of which these are to be united.

One of the queens being found, you must put the bees of both hives together; mingle them thoroughly, sprinkling them at the same time with a little ale and sugar, and put them among the combs of the latter hive, shaking them down in it. When they are all deposited, cover the hive with a cloth, bound close about it, and let them remain shut up all that night and the next day. Some time after this you will be sensible that they are awakened out of sleep. The second night after their union, in the dusk of the evening, gently remove the cloth from the mouth of the hive (taking care of yourself), and the bees will immediately fall forth with a great noise; but it being too late for them to take wing, they will soon return again: then inserting two pieces of tobacco-pipes to let in air, stop them close as before, and keep them thus confined for three or four days longer, after which the door may be left open.

The best time of the year for uniting them is when the young brood are all out, and before they begin to lodge in the empty cells, which they do in great numbers in cold weather and in winter. The operation should be performed early in the afternoon, that having the greater light, the queen may be more easily found. The few bees that are left in the hive should be suffocated with sulphur.

Mr. Thorey observes, that he never knew such combined stocks conquered by robbers, and that they will either swarm the next summer, or yield a hive full of honey.

Mr.

Mr. White's method of *hiving* a swarm into one or more of his boxes is as follows: take the loose board, mentioned under the article *HIVE*, and fasten it to one of the boxes, so as to stop the communication; this may be done by three of the flaps there mentioned, one on the top of the box near the front, the two others on the back near the top and near the bottom; let one end of the duple be thrust into a gimlet-hole made in the box, so that the other end may go as tight as possible over the loose board, to keep it from slipping when it is handled. Be careful to fasten the flaps so close to the glass, that no light may enter through it; and cover the box as soon as the bees are hived, with a linen cloth thrown loosely over it, or with green boughs, to protect it from the heat of the sun. If the swarm be larger than usual, instead of fastening the loose board to one box, you may join two boxes together with three flaps, leaving the communication open from one to the other, and then hire your bees in both. In all other respects, they are to be hived in boxes after the same manner as in common hives. The door of the second box should be carefully stopped up and kept constantly closed, in order that the bees may have no entrance but through the first box. *Thorley and White, ubi supra.*

HOACHE, in *Natural History*, a name given by the Chinese to a peculiar kind of earth, which they have found lately very useful in the manufacture of their China-ware. It is called *hoache* from the word *ho*, which signifies *soft* and *plastic*, and is described to us as being an earth approaching to the nature of chalk, but harder, and feeling like soap to the touch. There is great reason to believe, that this is either the same earth with our *soap-stone* of Cornwall, or something very like it. But we are to learn, in regard to the Chinese use of using it, that it is only one of the ingredients of their fine ware, not the whole matter of which it is made.

The Chinese physicians had long used this earth as a medicine, giving it in disorders of the lungs; but it is only of late times that the workmen in porcelain attempted to use it instead of kaolin. It succeeds, however, so well, that the porcelain made of it sells dearer in the Indies than any other kind. The grain of this porcelain is remarkably fine and even, so that it is fitter for receiving the finest pencilling than any other, and it may be made surprisingly light. But there is this disadvantage, that the whole is more brittle than ordinary china, and the fault of baking it is very difficult to hit; without which it is never strong. The Chinese sometimes make the body of their vessels of the common China-ware, and dip them when dry into a thick liquor like cream, in which the *hoache* is dissolved; this gives a new and beautiful coat to the vessel. They give the common varnishing over this, and it succeeds to a very great perfection. The manner in which the Chinese use it for this purpose is this: they first wash it clean with river water, to separate a yellow sort of earth, which lies near it in the mine where they dig it, and is often brought up with it. When it is thus cleaned, they beat it to powder, and mix it in large quantities of water; they stir the mixture well, and then letting the coarser part settle, they pour off the thick liquor, and let it stand till a substance like cream subsides, which they keep moist, and use, as before mentioned, to dip the vessels in, or else they dry it, and use it with the *petunse* instead of the kaolin in the common manufactures.

It is said that a good porcelain-ware may be made with this earth alone, without any other mixture; but the workmen themselves are unwilling to do this, and always chafe, if they do not work in the common way, to add at least two parts of the *petunse* to eight of the *hoache*, and with this mixture they make a very good ware, working it in the same manner as they do the *petunse* and kaolin.

The *hoache*, though ever so proper to supply the place of the kaolin, could not be used in the common works, because it costs three times the price, it being much scarcer, and brought much farther.

There is another very elegant sort of china-ware, which depends entirely on the *hoache* for its beauty: it is all white; but though the surface is perfectly smooth and polished, there are few flowers and other ornaments on it in a very delicate manner. The method of making this is as follows: they make the vessels of the common matter of the porcelain-ware; they then dissolve, in a sufficient quantity of clear water, as much of the refined *hoache* as will give it the consistence of a syrup. With this they pencil out the figures they intend on the surface of the vessel while yet not quite dry; this penetrates the surface, and the lines and strokes all appear very determinate. They let this dry thoroughly, and then cover the whole vessel with the common varnish of the porcelain.

When it has been baked, the whole appears white, but the figures are very distinctly seen, and appear extremely beautiful. They are of a brighter white than any of the rest, and seem formed of a thin white vapour, running with regularity just under the surface of the vessel. They have a way of doing this with another sort of earth, which they call *delas*; but this requires more trouble, as it must be retilled and powdered before it is fit for use. The white of this also is not so fine when done as the other. Observe, for les Contantes de l'Afrique, p. 300, Sec. See PORCELAIN.

HOACTLI, in *Ornithology*, the name of an American bird described by Nieremberg, of the race of a common hen: the legs and neck are long; its head is black, and ornamented with a beautiful crest of the same colour; its whole body is of a fine white, but its tail, as well as the upper sides of its wings, are grey; the wings have a greenish oil, and the back has occasionally many black feathers; its feet are not webbed, its legs are of a pale white colour, and it has a circle of white beginning at the eyes and encompassing the head. It is common on the lakes of Mexico, and builds among reeds and fedge. It bites very desperately. Ray's *Ornith.* p. 300.

HOACTON, in *Ornithology, the name of a Mexican bird described by Nieremberg, and seeming of the heron or bittern kind. Its neck and belly are white, slightly variegated with brown; the rest of the body is brown variegated with white; its eyes are large, and have a pale iris. Ray's *Ornithol.* p. 303.*

HOACTZIN, in *Ornithology, a name under which Nieremberg has described a species of American bird which is of the size of a hen, and has a crooked beak: the breast is of a yellowish white; its wings and tail are variegated with large spots of a pale grey and white colour; its neck and back are of a brownish yellow, and it has on its head a crest made of white feathers, which are black on their inside. Its voice is very loud, and it feeds on snails. It is seen in the autumn about Mexico, and generally frequents high trees near waters. Its bones, feathers, and some other parts, are esteemed by the natives specific in the jaundice and other diseases. Ray's *Append.* p. 300.*

HOANGICOYA, in *Natural History*, an amphibious animal, which in summer is a bird, and in winter a fish. See *CHOCORUS*.

HOAR-FISH, prisms. See *FROST* and *EVAPORATION*.

HOARSENESS, *rachitis*, in *Medicine*, a diminution of the voice, sometimes attended with a preternatural agency or roughness thereof.

The part here affected is the *ASPERSA arteria*, and particularly its lund or the *LARYNX*.

This distemper differs in degrees, being milder when from external causes, and much more obdurate and troublesome when from internal.

Signs of it. The hoarseness of the voice in speaking sufficiently manifests this complaint, but it is always also attended with a slight cough in the milder kind; and when of the feverish sort, is not infrequently accompanied with catarrhal and scorbutic effects, and not uncommonly, in its worst states, with a complication of venereal taints. The persons most subject to *hoarseness* are young and middle-aged men, and sometimes women, who have for some time been afflicted with obstructions of the menies.

Causes of it. *Hoarseness* is a sort of catarrhus induratio, arising from a too great acrimony or fulness of the lymph; and the general cause of it is a too copious effusion of thin lymph on the larynx and adjacent parts, or an interception of the lymph destined to lubricate the wind-pipe; and the occasional cause of this is usually an obstruction of the glandular parts, towards the top of that organ, in the *simplex racheoide*; but in the complicated kind, in which there is a scorbutic or venereal taint, an erosion of the epiglottis is very often the cause. Beside these, there are many accidental and external causes, which will bring on a *hoarseness*, such as the action of any small particle of extraneous matter, if it enters a grain of dust, into the wind-pipe; a vehement cough will also bring it on, as will a frequent loud singing, and too fat foods, and serid or bilious humours stagnating about these parts, and sometimes worn out by the intellect. It is easy to conceive, that the more concentrated this disease is, the more difficult will be the cure; and accordingly *hoarseness*, which have scorbutic or venereal taints for their basis are with great difficulty removed.

Modes of cure. Lubricating medicines are said to be given, to obviat the acrimony of the humours, and relax the stricture of the glandular parts. To this purpose are properly taken oil of almonds and the pectoral syrups, with barley-water, mucilaginous broths, and decoctions of the pectoral herbs, or infusions of them

drank

drank in the manner of TEA. When the *haufens* is occasioned by too great acrimony and viscosity of the lymph, a small quantity of borick-radish juice, mixed with honey, may be swallowed every morning with a draught of new-milk whey. When there is a COXXII or COXXIII attending it, these are to be treated in the usual way, and the *haufens* will usually go off with them. When the *haufens* arises from acid and bilious humours, the absorbents and nitrous medicines are to be given with gentle diaphoretic powders composed of crabs-eyes, nitre, and diaphoretic stimony, are of great use in this case. The bowels, in all these cases, are to be kept gently relaxed; and where there is a scorbutic or venereal taint for the basis, those diseases must be attacked in the common way, and then the *haufens* will be regularly taken off. A relaxation of the wind-pipe is usually accused as being the cause of a *haufens*, and that not without some foundation, since, where the humours are collected, there will be such a relaxation; but when we consider all the circumstances of the disease, and observe, that relaxing medicines are the only cure for it, we must acknowledge, that though a relaxation of some part of the *aperta arteria* may be in the case, yet that the origin of the complaint is from a constriction of some part of it; and it appears, that the longer this complaint remains with people, the greater the constriction becomes; so that after a course of years, the voice is not only hoarse, but is in a manner suppressed, so that it can scarce be heard. Junker's Consp. Med. p. 505.

Sperma ceti, decoct. rapar. & rob. piffular. are approved remedies herein. Where the disorder is inveterate, atenuants and expectorants are frequently of service.

In many instances, the most speedy relief is obtained from continuing the foot in warm water, for the space of half an hour, about bed-time.

HOASE, in *Sua-language*, is a long flexible tube, formed of leather or tarred canvas, but chiefly of the latter, and employed to conduct the fresh water, which is hoisted aboard a ship, into the casks that are ranged in the hold; and to pass the water, or other liquors, out of one cask into the other.

HOBAL, in *Arabian*, an idol of the Ancient Arabs, the worship of which at Mecca was destroyed by Mahomet.

HOBBISM, or *Philosophy of Hobbes*, in the *History of Literature*, denotes the metaphysical, moral, religious, and political opinions of Thomas Hobbes, a celebrated English writer, who was born at Malmesbury, in Wiltshire, in the year 1588.

Having distinguished himself in early life by his genius, application, and improvement, he was taken into the service and protection of the Devonshire family, which continued with little interruption, as long as he lived, and which gave him an opportunity of pursuing his studies, and of forming connections with persons of the first reputation for learning and science both at home and abroad.

His first work was an English translation of the *History of Thucydides*, which he published with a view to the state of his country, in order to shew the fatal consequences of intestine broils.

Having acquired a thorough acquaintance with the Latin and Greek languages, he applied himself to the study of mathematics; and particularly to the works of Euclid, which he read and admired, principally on account of the clearness of his reasoning, the connection of his arguments, and the wonderful perspicuity of his method. He also devoted his leisure hours to natural philosophy, and especially to mechanics and the causes of animal motion.

In 1640 he retired to Paris, where he became acquainted with the famous Des Cartes, with whom he afterwards corresponded, and whose doctrine concerning innate ideas he strenuously opposed.

In 1642 he printed a few copies of his book *De Cive*, a more complete edition of which was printed in Holland in 1657, by the care of Dr. Sorbiere: to this edition two commendatory letters are prefixed; one written by Gualeni and the other by Merseure, with whom Mr. Hobbes was on terms of intimate friendship.

In 1650, two other treatises were published at London; one entitled *Human Nature*, and another entitled *De Corpore Politico*, or the Elements of Law. During this time he had been digesting his religious, political, and moral principles, into a complete system, which he entitled *Leviathan*, and which was printed in English, at London, in that and the following year. Soon after this publication, he returned to England, and joined in communion with a congregation where the service of the church of England was used, and continued to resort thither.

In 1654 he published his treatise upon Liberty and Necessity, which occasioned a long controversy between him and Dr. Bramhall, afterwards lord primate of Ireland.

Vol. II. N° 172.

About this time he likewise began a controversy with Dr. Wallis of Oxford, which lasted as long as he lived, and in which he had the misfortune to have all the mathematicians against him: this controversy did him no credit; for though he was once and again related, and his mistakes were clearly pointed out, yet such was the obstinacy of his temper, he adhered as pertinaciously as ever to his old opinions, and rendered that a personal quarrel, which ought to have continued a literary dispute. He was no less positive and imperious in maintaining his moral, religious, and political sentiments; and he seems to have discovered, on a variety of occasions, a very unbecoming opinion of his own abilities, and a supercilious contempt of those of other men.

After the Restoration, in 1660, the king settled upon him a pension of a hundred pounds a year, but notwithstanding this favour, his Leviathan and his treatise *De Cive* were censured by parliament in 1666, a circumstance which much alarmed him: at the same time a bill was brought into the house of commons to punish atheism and profaneness, which it is said, induced Mr. Hobbes to write or to enlarge his book concerning *Hierely*.

In 1675 he published his English edition of the *Iliad* and *Odyssey*; in 1675 his dispute with Dr. Law, bishop of Ely, concerning Liberty and Necessity was printed; in 1678 appeared his *Decameron Physilogicum*, or Ten Dialogues of Natural Philosophy; and about the same time a new edition of the *Art of Rhetoric*, to which he added a Dialogue between a Philosopher and a Student of the Common Law of England; in the same year he also published his *Behemoth*, or History of the Civil Wars from 1640 to 1660.

Mr. Hobbes retained his understanding to his last sickness; inasmuch that he was not only capable of studying mathematics when above eighty-six years old, but also of writing very long poems. It has been said, that he was afraid of apparitions and spirits; but his friends call this a fable, though they acknowledge that he was afraid of being alone, and ascribe it to a fear of being assassinated. Mr. Bayle observes, that he meditated much more than he had read, and that he never cared to collect a large library; and Mr. Hobbes says of himself, that if he had bestowed as much time on reading as other men of letters, he should have been as ignorant as they. He was a great admirer of Homer, Virgil, Thucydides, and Euclid, but he made no account of large libraries, observing that men, for the most part, following one another's steps like sheep, have seldom the courage to go out of the trodden paths and routes which are prescribed to them by their guides. Mr. Hobbes died at the house of his patron, the earl of Devonshire, in the year 1679. For a fuller account of his life and writings, the reader may consult Bayle, or the Biographia Britannica, article *Hobbes*.

Mr. Hobbes's religious and political sentiments are chiefly contained in his book *De Cive* and his *Leviathan*; and it is certain, that there have been few persons whose writings, by the extraordinary abilities of their author and the singularity of his notions, for the dogmatical manner in which they are delivered and the agreeableness of their style, that have had a more pernicious influence in spreading infidelity and irreligion, though none of them are directly levelled against revealed religion.

Mr. Hobbes has been unjustly charged with atheism; for he expressly acknowledges the existence of God, and that we must necessarily arise from the effects which we behold, to the eternal power of all powers, and cause of all causes; and he blames the absurdity of those, who call the world, or the soul of the world, God: nevertheless, he denies that we know any more of him than that he exists, and seems plainly to make him corporeal; for he affirms, that that which is not body is nothing at all; *Ductor nemine significamus, boni generis est substantia incorporea*. Religion, he says, arises from the fear of power invisible, feigned by the mind, or imagined from tales publicly allowed, as superstition arises from those that are not allowed; and he elsewhere resolves religion into opinions of ghosts, ignorance of second causes, devotion to what men fear, and taking things casual for prophecies. He takes pains in many of his works to prove man to be a necessary agent (if these contradictory terms can be properly joined), and expressly asserts the materiality and mortality of the human soul; alleging, against the well known maxim of Des Cartes, "I think, therefore, I am," another maxim of his own, "I think, therefore, matter can think." And he represents the doctrine concerning the distinction between soul and body in man to be an error, contradicted by the contagion of the demonyology of the Greeks. The belief of a future state, he says, is grounded upon other

men's saying that they knew it supernaturally, or that they knew those that knew them, that knew others, that knew it supernaturally.

With regard to revealed religion, he treats the pretence to inspiration as a sign of madness: he alleges, that the books of Moses, and the historical writings of the Old Testament, were not written by those whose names they bear; and that they are derived to us from no higher authority than that of Ezra. As to the books of the New Testament, he acknowledges, that they are the true registers of those things which were done and said by the prophets and apostles; but he pretends, that they were not received as of divine authority in the Christian church, till they were established by the council of Nice, in the year of Christ 325. Though he sometimes seems to speak with veneration of the sacred writings, and to make the laws of Scripture the laws of God, yet he expressly asserts, that we have no assurance of the certainty of Scripture but the authority of the church, or the authority of the commonwealth; that the precepts of Scripture derive all their obligation from the will of the magistrate; and that the magistrate is the authoritative interpreter of all Scripture doctrine, to whom we are bound to submit. On the same principle he maintains, that the private reason must submit to the public, viz. to God's lieutenant; that a subject may be allowed to deny Christ in words, provided he retains the faith of Christ in his heart, when commanded by his sovereign; and that idolatry, to which a man is compelled by the terror of death, is no idolatry.

Mr. Hobbes's opinions with regard to natural religion and civil government are equally erroneous and extravagant: he asserts, that by the law of nature every man hath a right to all things, and over all persons, and that the natural condition of man is a state of war, a war of all men against all men; that every man acts reasonably, who endeavours, as far as possible, to make all the persons of others, till he sees no other power great enough to endanger him, that the civil laws are the only rules of good and evil, just and unjust, honest and dishonest, and that antecedently to such laws every action is in its own nature indifferent; that there is nothing good or evil in itself, nor any common laws continuing what is naturally just and unjust; that all things are estimated by what every man judgeth to be fit, where there is no civil government, and by the laws of society, where society is established: that the power of the sovereign is absolute, and that he is not bound by any compact with his subjects; that nothing the sovereign can do to the subject can properly be called injurious or wrong; and that the king's word is sufficient to take any thing from any subject, if there be need, and the king is judge of that need. *Non veritas, sed auctoritas facit legem.* And yet he elsewhere says, *Obligatio civium erga eum qui summam libertatem possident tandem est diutius permanere intelligitur, quam mandata potentia eius preestant.*

Wood, in his *Athenae Oxon.* vol. ii. p. 646. has asserted, that Mr. Hobbes, in advanced life, retracted many of his opinions published in his *Leviathan*, &c. and composed an apology for himself and his writings; but the authenticity of this apology has been disputed. Leland's *View of the Ecclesiastical writers*, vol. i. letter iii. Mosheim's *Ecc. Hist.* by Dr. Maclean, vol. iv. p. 244. note 6. 8vo. ed. 1768.

HOBBY, in *Ornithology*, the English name of a hawk of the long-winged kind, the *FALCO*. *Subulatus* of Linnæus, called, by many authors, by the name *subulatus*, the name by which others express the ringtail and hen-harrier. The hobby has a prominent and crooked beak, covered at the base with a yellow skin; the beak is white near this membrane, elsewhere it is blue; above each eye there is a white line; the crown of the head and back, and covers of the wings, are of a deep bluish black; the hind part of the head is marked with two pale yellow spots, and each cheek with a large black spot pointing downwards; the interior web of the secondary and quill-feathers are variegated with oval, transverse, reddish spots; the breast is white, marked with oblong spots of black; the thighs and vent-feathers are pale orange; the middle feathers of the tail are entirely of a deep dore-colour; the others are barred on their interior sides with red-colour, and tipped with a dirty white. The female is much larger than the male. The legs and feet are yellow. It builds with us in high trees, and breeds in England, but migrates in October; it feeds principally upon larks. It was formerly used in that species of *catconny* called *driving of larks*: the hobby was cast off, and the larks were fixed to the ground through fear, and became an easy prey to the net of the fowler. Pennant. See *Tab. II. of Birds*, N° 21. See *DORING* and *HAWK*.

HOBAY is also a name formerly given to strong active horses of a middling size: they are reported to have been

originally natives of Ireland, and were much liked and used. Nags answer the same description as to size, qualities, and employments.

HOBGOLIN, is a name vulgarly applied to fairies or apparitions. Skinner calls the word *hobgoblin*, and derives it from *Robin Goodfellow*, Hob being the nick-name of Robin; but Wallis and Junius, with greater probability, derive it from *hobgoblin*, *impus*, because they are supposed to hop without moving both their feet. Johnson.

HOBITS, in *Cannery*. See *HOWITT*.

HOBILERS, or *HOBILERS*, *HOBELARI*, in our *Ancient Customs*, were men who, by their tenure, were obliged to maintain a light horse or hobby, for the certifying any invasion toward the sea-side.

The name was also used for certain Irish knights, who used to serve as light-horsemen upon hobbies.

HOB-NAIL, a nail with a thick strong head, used in shoeing a hobby or little horse. Johnson.

HOBNOB, or *HAB NAB*, a cant word formed from *hop ne nob*, and denoting an event which happens at random or by mere chance. Johnson.

HOBBOO, a name given by the people of Otaheite, and in the neighbouring islands of the South Sea, to their super-fine cloth. It is the thinnest and most finished preparation of the *OUTA*.

HOBSON'S-choice, a vulgar proverbial expression, applied to that kind of choice in which there is no alternative. It is said to be derived from the name of a carrier at Cambridge, who let out hackney horses, and obliged each customer to take, in his turn, that horse which stood next the stable door. Scott.

HOCK. See *HAM*.

HOCK-Tuesday. See *HOCK-day*.

HOCUB, in *Botany*, a name given by Vaillant to a genus of plants, called by Tournefort and other authors *CYNODONTIS*.

HOCUS FOCUS, a cant term applied to a juggle or cheat. Dr. Tillotson derives it from the form of consecrating the sacramental bread in the Romish church, *hoc est corpus*. Junius derives it from the Welsh word, *a chod*, and *pele* or *peas*, a bag; the jugglers using a bag for conveyance. The etymology, however, is uncertain. Johnson.

HOD, a sort of tray for carrying mortar, in use among bricklayers.

HODEGOS, a term purely Greek *ήδεγος*, signifying guide. The word is chiefly used as the title of a book composed by Anastasius the Sinite, toward the close of the fifth century; being a method of disputing against the heretics, particularly the Acephali.

Mr. Toland has also published a dissertation under the same title. Its subject is the pillar of fire, &c. which went before the Israelites as a guide in the desert.

HODENSTEIN, in *Natural History*. See *ESORCHIS*.

HODGE-PODGE. See *HOCEN-ROT*.

HODMAN, a cant term formerly used for a young scholar admitted from Westminster-school to be a student in Christchurch in Oxford.

RODOMETRICAL (of *ήδος*, was, and *μετρον*, I measure,) method of finding the longitude at sea is that of the computation of the measure of the way of a ship between place and place, i. e. of observing the several rhumbs or lines in which the ship sails, and what way she has made, or how many leagues and parts of a league she has run. This method is liable to great errors.

HOE, or *How*, a husbandman's tool, made like a cooper's adz, to cut up weeds in gardens, fields, &c.

This instrument is of great use, and ought to be much more employed than it is, in hacking and clearing the several corners and pitches of land, in spare times of the year, which would be no small advantage to it.

Hoe-Hoe is a large kind of hoe drawn by horses, and used to stir the intervals in the new husbandry, and clear the corn from weeds.

The Rev. Mr. Hewitt, of Hadleigh, in Suffolk, presented to the Society for the Encouragement of Arts, &c. in 1766, the model of a new *hoy-hoy*, registered in the *Registry*, fig. 2. A represents a small round wheel of iron bar, fixed upon each end of the axle of the wheel, by which the hoe is drawn; the wheel B is three feet in diameter; C, C, are two flat iron bars, three feet long, fixed upon the axle of the wheel, and to the sides of the hoe, at E, E, by bolts and screws, and movable both upon the axle and bolts; F is a small round iron bar, fixed at each end into the bars C, C, at I and I, to the bars to these points may be strain, and from I, L, to L, L, to them be curved; H is the hoe itself, the breadth of which is to be regulated by the different distances of the rows of plants whose intervals are to be hoed; K, K, are two flat curved iron bars, fixed by bolts, upon which they are movable, to the bars C, C; each of these passes through a staple, fixed into the sides of the hoe at L, L; in

in both these small bars there is a row of holes, and in each triple one hole answering to a hole in each of the sides of the bar, which is fixed to any position by means of bolts passing through these holes, and some of the holes in the bars K, K, and thus the ground may be hoed as near the surface, or as far below it, as is necessary; M, M, are two wooden handles, fixed to the two sides of the bar, and to each other, by the cross bar O; these handles are as long and as high from the ground as those of a common plough.

This machine may easily be adapted to hoeing the furrows between the wheat ridges, by substituting, in the room of the flat hoe, one that is curved, and fitting its breadth and curvature to the breadth and curvature of the furrows that are to be hoed.

With this instrument the ground may be hoed to deep, as to cut under the roots of every weed it meets with below the crown or head; and thus they will either be destroyed or prevented from growing again during the season. There has been a farther improvement of this instrument by annexing a harrow to the bar. See *THE PLOUGH*.

HOING, in the *New Husbandry*, is the breaking or dividing the soil by tillage, while the corn or other plants are growing thereon. It differs from common tillage, which is always performed before the corn or plants are sown or planted, in the time of performing it; and it is much more beneficial to the crops than any other tillage. This sort of tillage is performed various ways, and by means of different instruments.

Land which, before the tilling, would have yielded little, though the more it is tilled before sowing the greater crop it yields, yet, if tilled only before the sowing, will always have some weeds, and they will partake of the advantage of the tillage as well as the corn. This is one reason for an after-tillage, such as that by *hoing*. But there is another consideration that yet more evinces the necessity of it, this is, that as soon as the ploughman has done his business, by ploughing and harrowing the land after sowing, the soil, of its own accord, begins to undo it all again, by tending towards its original texture and specific gravity again; the altering of which was the only business of all the former tillage. The breaking the particles of the earth, and making in it new pores, and new particles or new superficies, is the great business of the plough and harrow; but as soon as their use is over, the earth begins to coalesce again into its own form, the particles unite together, and the artificial pores in a great measure close up. The seed is nourished in a worse ground than it was first put into, and the more the plant grows up, and requires a larger supply of food, the worse the pasture becomes. While nourishment is thus denied the growing plants, they are at the same time choked with weeds, which being of a harder nature than they, will grow with less supplies, and therefore thrive more vigorously, and rob them of a great part of the little food the land before allowed them.

Farmers in all ages have been acquainted, in some degree, with the use of tillage and dung to crops of useful plants; but they have so ill managed the time of giving these assistances to nature, that there is no doubt but one third part of the nourishment raised by dung and tillage, if it were given to plants and corn at many proper seasons, and proportioned to the different times of their exigencies, would be of more benefit to the crop than the whole is, when applied all together at the time of sowing.

Nature, by what she does to the animal economy, seems to point out to us something like a remedy for this by *hoing*; for when the teeth, as the plough, have tilled that soil or mass which is earth altered, and when the saliva and the juices of the stomach have served to divide and attenuate it, as the salts of dung and other manure do land; after all this, the bile and pancreatic juices are ordained to further attenuate it, at the very time when it is ready to be exhausted by the numerous mouths of the lacteal frigate in the intestines. This last operation of these juices seems analogous to mellowing the soil by *hoing*, after the plants are grown and are become fit for use.

Transplanting is nearly allied in its nature to *hoing*, but it is much inferior. The nature of this will not admit of its being a general thing; and even if it would, *hoing* is better; for, by transplanting, the plants can only be kept up to a certain period, after which they will not bear it; but *hoing* may be used to them with advantage, to their utmost standing, and make them vigorous all the while.

The roots of a plant are necessarily broken off in transplanting, and it requires some time for it to strike a whole set of new ones; and if the earth about it is not kept thoroughly mellowed all this time, the new formed roots will not be able to shoot, and the plant will starve in the

midst of plenty. But, on the contrary, in *hoing*, the same advantage of a new pasture for the plant is obtained, by breaking the particles of the earth, and at the same time no more of the roots are broken off than can easily be supplied, and the rest remaining in their places, the plant continues growing without that stop and decay which must happen on transplanting, and which it recovers only by degrees. It is observed, that some plants are worse for transplanting; Lucerne and Linifolia are said by some to be never so good after transplanting, as when they are left in their native places, at the same distances; and Buchia removed is never so good and tender as when it is not. The last plant receives such a check from transplanting in its infancy, that it has afterwards a disease like the rickets, which causes knots and swellings in it that spoil it as a delicacy. All the top-rooted plants suffer by transplanting, for it is necessary in this to cut off the main long root, which afterwards, however good the soil may be, never arrives at the length it otherwise would have had, and which was necessary for the success of the plant.

*One great benefit of *hoing* is, that it keeps plants moist in dry weather, the advantage of which to their growth is easily seen. This good office it performs on a double account. First, as they are better nourished by *hoing*, they require less moisture, and carry off less; for those plants which receive the greatest increase, having most terrestrial nourishment, carry off the least water, in proportion to their augment, as is proved by Woodward's experiments. Thus barley or oats being trown on a piece of ground, well divided by tillage and dung, will come up and grow well without rain, when the same grains sown on another part of the same land, not thus dunged or tilled, will scarce come up at all without rains, or if they do, will wait wholly for the rains for their growth and increase.

The hoe also, particularly the horse-hoe, for the other does not go deep enough (and on this account horse-hoeing is much preferable to *hoing* with the hand-hoe, or scratch-hoe,) procures moisture for the roots from the dews which fall moist in dry weather, and these dews seem to be the most enriching of all moisture, as it contains in it a fine black earth, which will subside from it in standing, and which seems fine enough to be the proper pabulum or food for plants.

A demonstration that the tilled earth receives an advantage from these dews, which the untitled does not, is this: dig a hole in any piece of land, of such a depth as the plough usually goes to; fill this with powdered earth, and, after a day or two, examine the place, and the bottom part of this earth and the bottom of the hole will be found moist, while all the rest of the ground, at the same depth, is dry. Or if a field be tilled in lands, and one land be made fine by frequent deep ploughings, while another is left rough by insufficient tillage, and the whole field be then ploughed across in the driest weather, which has continued long, every fine land will be turned up moist, and every rough land as dry as powder from top to bottom.

Although hard ground, when thoroughly soaked with rain, will continue wet longer than fine tilled land adjoining to it, yet this water serves rather to chill than to nourish the plants standing in it, and to keep out the other benefits of the atmosphere; it leaves the ground much harder also than before, when it is finally exhausted out of it; and when, at length, the earth is thus hardened, it can receive no benefit from any thing less than a deluge of rain, which seldom falls till the season of vegetation is over.

As fine hoed ground it not so long soaked with rain, the dews never suffer it to become perfectly dry. This appears from the flourishing state of plants in hoed ground, while others near them, but in ground not hoed, are starved for want of nourishment. The common opinion is against this, but observation proves it to be true against the common opinion. The vulgar are misled by this, however, and will not hoe their ground in dry weather, for fear of letting in the drought, as they call it; whereas *hoing* this is the only method of keeping away the drought, and without either this, or watering, they must perish in their seasons.

There is a second advantage given to plants by *hoing*, which animals are not capable of. Meat and drink, in a proper degree, are all they require or can dispense with, and unless new mouths could be made to them they can use no more; but in plants, the *hoing* at once gives increase of nourishment in abundant quantities, and increase of mouths to receive it; for every time the hoe is struck into the ground, new particles of earth are made by breaking the old ones; the new pores made by these, afford a new supply of food to the plant, and every stroke of the hoe at the same time cutting off some of the fibrous roots of the plant, great numbers are propagated

in the places of every one that is cut, and the plant has at once more food, and more means to feed with. Tull's Horse-hoeing Husbandry, chap. vi.

It is a certain fact, that breaking the soil and exposing it to the operation of the air are found to fertilize it; but Mr. Tull, in order to account for this fact, adopted a mistaken theory, which supposes that fertilization consisted principally or solely in breaking the earth into fine parts, that they might be the better fitted to enter the nutritious vessels of the plants. It would be easy to shew, nevertheless, that reducing the earth into small parts is only one means of fertilization, and not even constant in every circumstance; that the fitting earth to cover plants by mechanical action is an error, as it never does enter plants at all in a solid, undissolved state; and that when earth is in the most pulverized and incohering state, it is least fertile or capable of supporting plants. However, the fact is certain, though for different reasons, that till and cohering earth, broken and exposed to the air, does gain a considerable degree of fertility, and is capable of yielding copious crops of some kinds of vegetables, which it would not otherwise bear. Dollé's Mem. of Agriculture, vol. i. p. 74. See HESSEBANDY.

HOFFMANISTS, in *Enlightened History*, denote those who espoused the sentiments of Daniel Hoffmann, professor of the university of Helmstadt, who, from the year 1508, maintained, that philosophy was a mortal enemy to religion; and that what was true in philosophy was false in theology. These absurd and pernicious tenets occasioned a warm and extensive controversy: at length Hoffmann was compelled, by Julius, duke of Brunswick, to retract his invectives against philosophy, and to acknowledge, in the most open manner, the harmony and union of sound philosophy with true and genuine theology.

HOG, *fau*, in the *Linnean System of Zoology*, a distinct genus of animals, of the order of *lanius* and class of *mammalia*: the characters of which are, that the upper fore-teeth are four in number and convergent; those of the lower jaw are six and prominent; the canine teeth of the upper jaw are two, and shortly those of the lower jaw are single and thrust out; the snout is truncated, prominent, and moveable. Of this genus are the common *hog*, the Guinea *hog* or *porcus* *Gustavius*, the Mexican male *hog* or *Tajado*, the *hydroporci* or *Caybars*, and the *ABYSSINIA*.

The common *hog*, or *fau* *fervo* of Linnaeus, is covered with bristles; in a wild state it is of a dark brindled colour, and under the bristles there is a soft curled hair; the ears are short and a little rounded; in its tame state, the ears are long, sharp-pointed, and fleshing; the colour is generally white, sometimes mingled with other colours. The *hog*, in its wild state, is found in most parts of Europe, except the British Isles and the countries north of the Balcies in Asia, from Syria to the borders of the lake Barkal; in Africa, on the coast of Barbary; and in the forests of South America.

Tame *hogs* are found universally, except in the frigid zone and Kamtskatka, and such places where the cold is very severe. The Chinese *hog* is only a variety of the common *hog*; its belly hangs almost to the ground, its legs are short, its tail reaches to the heels, and the body is generally bare: it is a much cleaner animal than ours.

Hogs are stupid and voracious animals; inasmuch that they will eat their own offspring and devour even infants: but it is observed, that the *hog* is not indiscriminate in the choice of its food; for it has been found to eat seventy-two species of vegetables, and to reject a hundred and seventy-one. In America it clears the country of rattle-snakes, which it eats with safety. *Hogs* cannot bear excessive cold, and are very restless in high winds. There are few animals that are useful in a greater variety of ways than *hogs*; they are extremely profitable; their flesh is agreeable and wholesome food to those who use much exercise; and as it takes fat better than any other kind, it is of great importance to a commercial nation.

Hogs furnish grease, and lard, and bristles. In *Mexico*, the skin and the *hog* are yoked together to plough the land; and the *hog* has been applied to the same use in our own islands, viz. in that part of *Montserrat* which lies between the *Sney* and *Edin*. Pennant. See BOAR. These animals are very profitable to the owner, being kept at small expense, feeding on things that would be otherwise thrown away, and producing a very large increase. They are apt to dig up the ground and to break fences; but this may be prevented, by putting rings in their noses, and yokes about their necks. Leicestershire, Northamptonshire, and Hampshire, are famous for these animals, which seem owing to their being clayey countries, and that more beans and peas are sown there than in other places. The wild kind never grow so large as the tame, but they are much better tailed. The keepers of *hogs* should always choose such boars for the purpose of breeding as are long-bodied, and have deep bellies and

stiff, short noses, thick thighs, short legs, high claws, a thick neck, and a thick chine, well set with large bristles. It is not proper to keep too many breeding sows; for they will produce so many young at a time, and this three times a year, that they will not find food enough.

They usually bring thirteen or fourteen young ones in a litter, sometimes more, but they can bring up no more than they have teats to suckle. Young sows, as they are called, that is, sows of three quarters of a year old, are best for pork, and those of a year and a half for bacon. The males that are reared should be gaily, and the sows spayed; and for this purpose, those which are pigged in the spring are the best. Moist and fleggy grounds are good for swine, for they eat the roots of many of the plants that grow there, and the fruit of the beech, chestnut, and hedge bushes, fatten them well, and make their flesh much better tasted than when bred entirely in the sty. Mortimer's Husbandry, p. 253.

Mr. Young observes, that *hogs* may be kept in summer, with great advantage to the farmer, in clover-fields; and that lucerne is superior to clover for this purpose, and that sainfoin is very good; but that burnet is very bad. In winter they may be well maintained with carrots, parsnips, beets, and potatoes. The dairy should be appropriated to rearing pigs and feeding sows that have young. It appears, from other experiments of this writer on the fattening quality of several sorts of food for *hogs*, that pollard alone is a cheaper food than peas alone; that boiled carrots are much the most profitable; that buckwheat is more profitable than peas; that several kinds of food mixed are better than any given alone; that the meal of any one, or various kinds of grain, is better and more profitable than the whole grain mixed or alone; and that peas and barley are much sweeter food than beans. The keeping of *hogs* in any city or market town is indelible as a public nuisance.

The dung of *hogs* is one of the richest manures we are acquainted with. See DUNG.

The farmers who use the dung for their lands, generally take care to save it by well paving the sty, and increase the quantity by throwing in bean-stalks, stubble, and many other things of a like kind; and, by good management of this kind, many farmers have procured fifty or sixty load of excellent manure a year out of a small sty. The very best way of using this dung is to mix it with horse-dung; and, for this reason, it is best to have the sty near the stable, that the two cleanings may be mixed in one heap, and used together.

They have, in many parts of Staffordshire, a poor, light, shallow land, on which they bear a kind of white peas. The land is neither able to bear this, nor any thing else, to their advantage, for reaping. But when the peas are ripe, they turn in as many *hogs* as the quantity of peas will sustain, suffering them to live at large, and remain there day and night; and, in consequence of this, the land will produce good crops of hay for several years afterwards, or, if too poor for that, it will, at the worst, raise grass enough to make it a good pasture-ground.

HEDGE-HOG, *erinaeus*, in *Zoology*, a genus of animals of the order of *ferae*, in the class of *mammalia*. The characters of this genus are these: that the upper fore-teeth are two in number and distant, and that the lower are two and less distant; the canine teeth are two on both sides, and recumbent. Of this genus there are three species, viz. the European or common *hedge-hog*, the American *hedge-hog* without ears, and the Malacca *hedge-hog* or porcupine with pendulous ears.

The head and snout of the European *hedge-hog* resemble those of a *hog*, but the nostrils and extremity of the snout have more resemblance to those of a dog; the nostrils are narrow, and bordered on each side with a loose flap; the ears are broad and like those of the mouse kind, and its eyes are small and prominent; its legs resemble those of the dog, and each foot has five toes, all armed with sharp claws; of these the inner is shorter than the rest; the upper part of the face, the sides, and rump, are covered with long coarse hair, resembling bristles, of a yellowish cinereous colour; the back with strong sharp spines of a whitish colour, with a black bar through their middle; the tail is an inch long, and the length from the side to the tail is ten inches. See *Art. II. Quadrupeds*, N° 15.

The *hedge-hog* is a nocturnal animal, keeping retired in the day, and in the night searching for food. It generally retires in small thickets, in hedges, or in quies covered with bushes; its food is roots, fruits, worms, and insects; and it is unjustly reproached with sucking cows and hurting their udders, which is impossible on account of the smallness of its mouth.

The *hedge-hog* is a mild and patient animal, and in the prospect of injury rolls itself into the form of a ball, in which state it is said to lie torpid during winter, and is then invulnerable. Pennant.

Holo-Hog, fer. See ECHINODERMA, CENTRONIA, and SEA URCHIN.

Hog's-fennel, in Botany, the English name of a genus of plants, called by botanists *peucedanum*. See *Hog's FENNEL*.

Hog-plum, the name of a distinct genus of plants, called by authors *spandax*. See *PEUM*.

Hog-weed, the name of a distinct genus of plants, of the *monarda* or *monarda* class, called by Linnaeus *Borhavia*. Its characters are these: the flower hath one bell-shaped petal, which is pentagonal, and entire; it hath in some species one, in others two short stamens; the germs is situated below the receptacle, and becomes a single oblong seed, having no cover. According to Miller there are four species, natives of warm climates; but Linnaeus reckons six.

This plant is nearly allied to the valerians.

Hog-flor, among Hunters, a wild boar of three years old. See HUNTING.

Hog, on board of a Ship, is a sort of flat scrubbing broom, formed by inclosing a number of short twigs of birch or such wood, between two pieces of plank fastened together, and cutting off the ends of the twigs, and leaving to escape the dirt from a ship's bottom, under water, particularly in the act of *scot-topping*. For this purpose they fit to this broom a long staff, with two ropes; one of which is used to thrust the *hog* under the ship's bottom, and the other to guide and pull it up again, close to the planks. This business is commonly performed in the ship's boat, which is confined as close as possible to the vessel's side during the operation, and thrust from one part of the side to another, till the whole is completed. Marine Dict.

HOGGED, or HOG-BALE, is a young boar of the second year.

HOGGENHINE, HOGGENHINE, or rather *ACESHINE*,

q. d. *rum forum*. See *TRILLIX* next *even* kind.

HOGI, in the Egyptian Church, as at Cairo, is an under attendant on the mosque, who is the reader under the sheik.

HOGOE, properly HAUT-GOUT, a mess in cookery, to be denominated from its high flavour, or relish.

HOGSHEAD, a measure, or vessel, of wine or oil; containing the fourth part of a tun, or sixty-three gallons. Two of these *hogsheads* make a pipe or butt. See MEASURE. The distillers weigh their vessels when full, and for a *hogshead* allow four hundred weight, two quarters, and twenty-two pounds, cask and liquor.

HOIST, in Sea Language, denotes the perpendicular height of a flag or ensign, as opposed to the *fly*, which signifies its breadth from the staff to the outer edge.

HOISTING signifies the operation of drawing up any body by the assistance of one or more tackles. *Hoisting* is never applied to the act of pulling up any body by the help of a single block, except in the exercise of extending the sails, by drawing them upwards along the masts or bays, to which it is invariably applied. Mar. Dict.

HOITLALLOTL, in Ornithology, the name of an American bird, described by Niezenberg, and called by him *avis faga*. It is very remarkable for the swiftness of its running, and is of a very long shape, having also a long tail; its beak is also very long, black above, and grey underneath; its tail is green, and has all the splendour and beauty of the peacock's; its whole body is of a whitish yellow, and near the tail of a blackish yellow; but the shoulders are black, with white spots; it does not fly high, nor very well, but runs so swift as is scarce to be conceived. It is but an ill-tasted bird.

HOITZLOTTIL, in Botany, a name by which some authors have called the tree which affords the balsam of Peru.

HOITZTIL, in Ornithology, the name by which some authors have called the guianambi, or HUMMING-BIRD, the smallest of all birds.

HOITZTILIN, in Ornithology, the name of a beautiful American bird, described by Niezenberg. The Indians prodigiously esteem this bird, and use its feathers in ornamenting their images. It is not lawful to kill it, only to strip it of its feathers, and then turn it loose; and this no one may do but the principal person of the place. The method of getting their feathers, according to Hernandez, is the inviting them to some boiled Indian wheat, and placing them twice in their way. They fly in large flocks, and sit together on trees, making a confused hissing noise. They breed in the holes of trees.

HOCK-DAY, HOCK-DAY, or HOCK-TUESDAY, in our Ancient Customs (Diet Maris, quoniam quindam piscis comest) the second Tuesday after Easter week; a solemn festival celebrated for many ages in England, in memory of the great slaughter of the Danes in the time of king Ethelred II. in 1002; they having been, in that reign, almost all destroyed in one day in the different parts of the kingdom, and that principally by women. Mr. Bryant apprehends, that a holiday could not have been instituted for the commemoration of so cruel an event, which afforded matter for humiliation and sorrow rather than of festivity and mirth. Others have therefore, thought,

that *Hock-day* alluded to the death of Harthacanute, the last monarch of the Danish race, at a marriage feast in Lambeth, on the 8th of June, 1041: by whose death, the English were for ever relieved from the wretched insults, and boundless exactions of him and his consanguines. See a Memoir on *Hock-day*, by the Rev. Mr. Denon, in the Archaeologia, vol. vii. p. 244. This is still kept up in some counties, and the women bear the principal way in it, hopping all passengers with ropes and chains, and exacting some small matter from them to make merry with. This day was very remarkable in former times, inasmuch as to be used on the same footing with Michaelmas, for a general term or time of account. We find leases without date referring to much rent payable *ad diem et terminum, scilicet ad hock-day, &c.* and *scilicet festum Michaelis*. In the accounts of Magdalen college, Oxford, there is yearly an allowance, *pro mulieribus hockistis*, of some mangers of their's in Hampshire; where the men *hack* the women on Mondays, and the women *hack* them on Tuesdays. The meaning of it is, that, on that day, the women in merriment stopped the way with ropes, and pulled passengers to them, desiring something to be laid out for pious uses.

HOCK-DAY money, or HOCK-TUESDAY money, a tribute anciently paid the landlord, for giving his tenants and bondsmen leave to celebrate *hock-day, or hock-day*, in memory of the expulsion of the dominating Danes.

HOLCE, 'Oke, a word used by some of the Greek authors, as the name of a dram weight; and by others, as *Dioleides*, &c. to signify a weight in general.

HOLCUS, the name by which the ancients called the common grassen feculium, or eye-grass, commonly called by us barley-grass, or wild barlett barley; a low grass, with a large bearded ear, growing under old walls.

HOLCUS, in the Linnaean system of Botany. See *Indian MILLER*.

HOLD, in the Marine. See *REMAIN*.

HOLD of a ship, the lowest part of the ship, including all that part of her inside lying between the floor and the lower deck, through her whole length. See *Talk Ship*, fig. 2. *ht. G. fig. 3. n. 116*.

The hold is the store-room in a merchant ship, or the place wherein the goods, at least all the heavier and more cumbersome, are stowed: the rest are disposed between the two decks; at least in Dutch ships, which have their holds very shallow, and the space between the decks very high. The hold contains the ballast, provision, and stores, of a ship of war. The several store-rooms are separated by bulk-heads, and are denominated according to the several articles they contain, the sail-room, the bread-room, the fish-room, the spirit-room, &c.

To find the burden of a ship, the hold is to be measured.

HOLD P, in Sea Language, is understood to signify a particular situation with regard to the shore, by which the vessel is enabled to keep within a sufficient distance, to facilitate her course, or answer some other important object. *Keep a good hold of the land*, implies to keep near, or in sight of the land.

HOLD, after, denotes that part of the hold which lies about the main-mast.

HOLD, fore, is that part of the hold which is situated in the fore-part of the ship, or before the main hatchway.

HOLD its own, at Sea. A ship is said to hold its own, that keeps its course right forward.

HOLD, to ramogue live, at Sea, is to remove and clear the goods and things therein.

HOLD, ready to, in the Sea Language. See *PREADY*.

HOLD, to trim the. See *TRIM*.

HOLD, flowing the, a phrase for taking goods into the hold. See *STOWAGE*.

HOLD, in Music, is a mark, like an arch, with a point in the middle of it, placed over some single notes, which has been used to signify that such note is to be made longer than ordinary; but it now more commonly denotes that the long ends there, and is only used when the long ends with a repetition of the first strain, or part of it.

HOLDE, in our Old Law-Books, is used for the bailiff of a city or town; and sometimes for a general.

HOLD-FAST, an iron hook, in shape of the letter S, fixed in a wall, to retain and support it.

This term also denotes a tool used by joiners, &c. which goes through their benches, to hold fast such work as cannot be finished by being held in the hand.

HOLDING on, in Sea Language, is the act of pulling back the hind-part of any cable, or other rope, which is heaved round by the capstan or windlass, or drawn in by the purchase of a tackle. As there are only a few turns of any rope upon the barrel of the capstan or windlass, when it is employed in heaving, an equal quantity of the rope will necessarily come off from the capstan at the same time; and this is accordingly pulled back as strongly as possible, to prevent it from furling or jerking round the barrel, by being held too loosely; for that *holding on* denotes the act of retaining any quantity of rope, ac-

quised by the effort of a capstan, windlass, or tackle, as these are employed in hoisting as well as in heaving, Mar. Dict.

HOLDING water signifies the operation of stopping a boat in her course, by taking the oars in the water, and bearing the blade or flat part strongly against the current made along-side, by her passing swiftly through the water.

HOLDING over a term, &c. in Law. By a Geo. II. cap. 28. in case any tenant for life or years, or other person claiming under or by collusion with such tenant, shall wilfully hold over after the determination of the term, and demand made in writing for recovering the possession of the premises, by him to whom the remainder or reversion shall belong; such person so holding over, shall pay for the time he continues at the rate of double the yearly value of the lands so detained. See EJECTMENT.

HOLE, in Anatomy, denotes such a cavity of a bone as penetrates from one side to the other.

HOLE, Black, at Calcutta, denotes a place of confinement, eighteen feet by eighteen feet, containing three hundred and twenty-four square feet, in which a hundred and forty-six persons were shut up by order of the victors; so that there was a square for each person of twenty-six inches and a half by twelve inches, which was just sufficient to hold them, without pressing violently upon each other. To this dungeon there was only one small grated window; and the weather being very sultry, the air within could neither circulate nor be changed. In less than an hour after their being inclosed, many of the unhappy people were seized with extreme difficulty of breathing, several were delirious, and the place was filled with incoherent ravings, and exclamations of distress; the cry of *vater! vater!* was predominant. This was handed to them by the centinels, but had no effect in allaying their thirst. In less than four hours, many were suffocated, or died in violent deliriums. In an hour more, the survivors, except a few at the gate, were to the highest degree phrenetic and outrageous. At length those at the gate became so insensible, that we have no account of what happened, till they were released at six o'clock next morning, having been confined from seven the preceding evening. Such were the effects of animal effluvia in a close and unventilated place, in the space of eleven hours; that out of a hundred and forty-six persons, no more than twenty-three came out alive, and those in a high purring fever, of which, however, by fresh air &c. they gradually recovered.

HOLLAND, or HOLYBURY, in Ichthyology, a name given by the people of some parts of England to the turbot in general; but in other paroxysms to the larger fishes of that species. See HAREPOUND.

HOLLAND, in Lino Drapery, a fine, white, even, close kind of linen cloth, chiefly used for shirts, sheets, &c. It is principally wrought in the provinces of Holland, Frisland, and other parts of the United Provinces; whence the appellation.

The principal mart or staple of this cloth is at Harlem, whither it is sent from most other parts, as soon as wove, there to be whitened in the ensuing spring.

That manufactured in Frisland is the most esteemed, and called *Fris Holland*. It is the strongest and the best coloured of any of that fineness; it is never calendered, nor thickened, as the rest; but it is imported just as it comes from the whistler: it is distinguished by its being yard quarter and half wide; which is half a quarter more than those commonly called *Fris Holland*, which are not right.

HOLLAND, guise, is very white and fine, and is chiefly used for shirts, being the strongest of any for its fineness, except true Fric. It is just yard wide.

HOLLAND, Alomar, is a very strong cloth, and wears exceedingly well. It is about yard quarter and half wide.

HOLLI, the Indian name for what the Spaniards call *ulsi*; a resinous liquor, which flows spontaneously from the tree *Miquachayti*, or *chilli*. It is often mixed with chocolate in the making, in the proportion of one fourth part; it gives the chocolate in this case no very disagreeable flavour; and becomes a very powerful medicine in dysenteries. It is usual, however, before the making it, to mix the cacao and *ulsi* on an iron plate, and to stir them thoroughly together.

HOLLOA, in Sea Language, is an exclamation of answer to any person who calls to another to ask some question, or to give a particular order. It is also the first answer in hailing a ship at a distance.

HOLLOW, in Architecture, a concave moulding, about a quadrant of a circle, by some called a *CASEMENT*; by others an *ARABUS*.

HOLLOW rest, in Botany. See FUMITORY, and MOSCHATELLINA.

HOLLOW square, in Military Language, is a body of foot, drawn up with an empty space in the middle, for the co-

lours, drums, and baggage; facing and covered by the pikemen every way, to oppose the horse.

HOLLOW tower, in Fortification, is a rounding made of the remainder of two batteries, to join the curtain to the garrison, where the small shot are paid, that they may not be so much exposed to the view of the enemy.

HOLLOW timber bark, in the Manager. See SHELL-timber.

HOLLOWNESS of trees. This is one of the most mischievous distemperatures to which trees are subject. It is generally occasioned by the LOPPING of them in an improper manner, and leaving the wet to fall in upon them, especially on their heads. When this mischief is found out in its beginning, the only method is to cut the trunk off in the quick, sacrificing the whole hollow parts; it is, in this case, to be cut off sloping, that the wet may run off from it. All soft woods are liable to this mischief, after the lopping, particularly the elm; and when it takes hold of any tree, it grows upon it daily, till the whole substance of the tree is at length eaten away, and only a coat of bark is left. The best way of preventing it in the elm, is never to cut off the head or top of the tree at all, but only to lop the side branches; these will yield a very large quantity, and the body of the tree will thrive the better for their being often cut off, and will be good timber at last. These tall elms sometimes grow *holten* from another cause, that is, from the decay of some of the large roots; but the staving condition of its branches will shew this, though there be no external mark of it. This sort of *holtenness* always begins at the bottom of the tree. Blasted parts of the trees are to be cut away in the quick, in the same manner as the hollow ones, and the wounds will heal in the same manner.

HOLLY, Lvs. in Botany, a genus of the *terranaleia dignia* class. Its characters are these: they have male, female, and hermaphrodite flowers, on different plants, and often on the same tree; the male flowers have a permanent emplacement of one leaf, indented in four parts; they have but one petal, cut into four segments, and have fourawl-shaped stamina; the female flowers have their emplacements and petals the same as the male, but have no stamina; in the centre is placed a roundish germ, which becomes a roundish berry with four cells, each containing a single hard seed. There are three species, including many varieties.

The common *holly* grows naturally in woods, and forests in many parts of England, where it rises from twenty to thirty feet high, and sometimes higher. It is a beautiful tree in the winter, and therefore merits a place in all plantations of evergreen trees and shrubs. *Holly* was formerly planted for HEDGES, and is a very proper plant for that purpose.

The seeds of the *holly* never come up the first year, but lie in the ground as the baw do. The berries therefore should be buried in the ground the first year, and then sown up and sowed at Michaelmas upon a bed exposed only to the morning sun. In this bed the plants may remain two years, and then should be transplanted in the autumn into beds about six inches asunder, where they may stand two years longer, and then they will be strong enough to be transplanted to the ground in which they are to remain.

The best time for transplanting the *holly* is in autumn, especially in dry land; but if the soil is cold or moist, they may be safely transplanted in the spring. Miller. *Holly-berry* are a very beautiful ever-green and strong fence, but liable to perish in hard winters. It has been supposed, that the severity of the cold in these seasons was the occasion of this; but a closer observation has shewn, that the mischief is owing to the field-mice, which in very severe seasons, when they can get at nothing else, disturb the roots of these shrubs. The method of preserving these hedges, in such seasons, is found to be by clearing away the weeds which are a harbor to these little animals, and placing traps and boxes in proper places, with a paste made of butter and rathbane, daubed over their insides, and holes made in their sides no bigger than what the mice or rats, if there be any there, can creep into; and thus the vermin are destroyed, and the mischief which might attend rathbane being exposed, are prevented. See PRUNCE.

The berries of *holly* are hot and dry, of thin parts, and expel wind. They are good against the colic; ten or twelve being taken inwardly, bring away by stool thick obdurate humours.

The *STRIKING* which is made of the bark is no less hurtful than that of mistletoe, if taken inwardly, by placing up the intestines. *Holly* beaten to powder, and drunk, is an experienced medicine against all fluxes of the belly, as the dysentery, and the like. James.

The timber of *holly* is the whitest of all hard wood, takes a fine polish, and is therefore used by the joiners. See MARQUETRY.

It is also used for all sturdy uses, and therefore preferred to

all others by the mill-wright, turner, and engraver. It makes the belt handles and blocks for tools, hails, cart-wheels, bowls, shivers, and pins for blocks; and is excellent for door bars, &c.

HOLLY, *laurel*, a name sometimes given to the *rasau*, or *butcher's-broom*.

HOLLY, for the name by which some call the *eryngium* of botanical writers. See *ERYNGIUM*.

HOLLYHOCK, or *Rosmalina*, *Acon*, in *Botany*, a genus of the *mandibula polyandra* class. Its characters are these: the flower has a double empaleme, of which one is permanent, and cut into six parts; the inner is larger, and slightly cut into five; the flower is composed of five petals, which coalesce at their base, and spread open at the top in the form of a rose; in the centre is placed a round germen, supporting a short cylindrical style, with many filaments joined below to the pentagonal column, and spread open at the top; the germen afterward becomes a round, depresso, articulated capsule, having many cells, in each of which is lodged one compressed kidney-shaped seed. There are two species.

We have many varieties of this plant cultivated in our gardens, for the beauty of their flowers. They are all propagated from seeds, which are to be sown about the middle of April, upon a bed of light earth, and covered with the same earth about half an inch deep. When the plants are come up pretty strong, and have put out six or eight leaves, they should be transplanted out into nursery beds at about a foot distant from one another. They must be watered till they have taken root, and will then require no further care for summer, but being kept clear of weeds. In October following they should be transplanted into the places where they are to remain, and set in rows of two feet distance, and at a foot from each other in the rows where they may flower; and when it is observed which roots produce the finest flowers, those should, at the next Michaelmas, be transplanted into garden beds, where they will live four or five years; after which they grow weak, and should be replaced by new ones. When the stalks of the plants begin to decay, they should be cut down close to the ground, otherwise they are apt to rot and destroy the roots.

HOLM, *Hulmus*, signifies as much as *infusa annua*, a river-land, according to Boet; or a plain, grassy ground, upon the water-side, or in the water, according to Camden.

Where any place is called by the name *holm*, or where this syllable is joined with any other in the name of a place, it signifies it to be surrounded with waters. As the *flatholm*, the *lepholm*, near Bristol. If the situation of the place be not near the water, it may signify a hilly place; *for holm*, in *Saxon*, also signifies a *hill*, or *cliff*.

HOLM, *see OAK*.

HOLocaust, *holocauster*, formed from *holo*, whole and *causto*, to burn, a kind of sacrifice, wherein the whole offering is burnt or consumed by fire; as an acknowledgment that God, the creator, preserver, and lord of all, was worthy of all honour and worship; and as a token of men's giving themselves entirely up to him. It is called also, in Scripture, a *burnt-offering*.

Sacrifices of this sort are often mentioned by the heathens as well as Jews; particularly by Xenophon, Cyropæd. lib. viii. p. 464. ed. Hutchins. 1738, who speaks of sacrificing *holocausts* of oxen to Jupiter, and of horses to the Sun; and they appear to have been in use long before the institution of the other Jewish sacrifices by the law of Moses. See Job i. 5. chap. xiii. 8. Gen. xiii. 13. chap. viii. 20. On this account, the Jews, who would not allow the Gentiles to offer on their altar any other sacrifices peculiarly enjoined by the law of Moses, admitted them by the Jewish priests to offer *holocausts*; because these were a sort of sacrifices prior to the law, and common to all nations. During their subjection to the Romans, it was no uncommon thing for those Gentiles to offer sacrifices to the God of Israel at Jerusalem. Vitæ Philo. Opera, p. 801. E. Ed. Colon. Allob. 1613. Tertullian. Apolog. 1. 26 p. 26 ed. Rigalt. 1675.

Holocausts were deemed by the Jews the most excellent of all their sacrifices. It is said, that this kind of sacrifice was in common among the heathens, till Prometheus introduced the custom of burning only a part, and reserving the remainder for his own use. See *SACRIFICER*.

HOLOGRAPHUM, composed of *holo*, all, and *grapho*, I write, in the *Civil Law*, something written wholly in the hand-writing of the person who signs it.

The word is chiefly used in speaking of a *TESTAMENT*, written wholly in the testator's own hand.

The Romans did not approve of *holographic* testaments; and, though Valentinian authorized them by a novel, they are not used where the civil law is in full force.

HOLOMETER, composed of *holo*, all, and *metron*, I mea-

sure, a mathematical instrument serving universally for the taking of all sorts of measures, both on the earth and in the heavens.

The *holometer* is the same with another denominated *panometer*.

HOLOSCHENOS, in the *Materia Medica*, the name of the great bulrush, or *juncus laevis maximus*, common in rivers.

HOLSERICA, *vestis*, a garment entirely of silk, as the name imports, which was not used at Rome till the time of Heliothalus.

HOLOSTEUM, in *Botany*, a genus of the *tribulus trigynia* class; the calyx of which is five-leaved; the corolla consists of five petals; and the fruit is a subcylindric single-celled capsule, opening at the apex.

HOLYSTUM, in *heliography*, a name by which Bellenius, and some others, call the *OSIRACON*, a fish of the river Nile, covered with a hard fleshy skin, and approaching in its body to a pentagonal form.

HOLOTHURIA, in *Natural History*, a genus of sea-worms of the order of *melusis*, in the Linnaean system. These are distinguished by a pliable, naked, gelibous body, terminated by the anus at one extreme, and furnished at the other with many tentacles, encompassing the mouth. Linnaeus enumerates nine species.

HOLOTONICOS, a word used by some authors to signify an universal convulsion or rigor over the whole body.

HOLQUAHVILT, in *Botany*, a name by which some authors have called the tree which produces the Jesuits bark.

HOLSOM. A ship it said to be *holsam* at sea, when she will hull, try, and ride well, without rolling or labouring.

HOLT-water. These have been found by experience to be of admirable efficacy in all scorbutic and scrophulous cases. An account of some very remarkable cures performed by them in these cases, was printed several years ago; and though known to be fact in the place, was disbelieved by almost every body beside.

Mr. Lewis, formerly minister of the place, confirms their efficacy from his own observation; and observes, that they are of an attenuating, alligating, and drying nature. The first of these properties they possess in common with all waters which dilute, attenuate, and fit the juices for passing the proper vessels; their alligating they owe to the alum and iron which they contain; and their drying, absorbing, and healing qualities, are probably owing to a quantity of sulphur, and a fine light ochre, which they are impregnated with. Phil. Trans. N° 408.

HOLYNES, or *HOLINESS*, sanctity; the quality which constitutes or denominates a person or thing *holy*; i. e. pure, or exempt from sin.

HOLYNES is also used in respect of persons and things that are sacred; i. e. set apart to the service of God, and the use of religion.

In this sense we say, *holy days*, *holy ordinances*, the *holy Bible*, *holy Gospels*, *holy war*, &c. The Roman catholics call the inquisition the *holy tribunal*; the see of Rome, the *holy see*, &c.

Holy oil, *holy water*, &c. See *UNCTION*, *WATER*, &c. Palestine is particularly called the *holy land*, and Jerusalem the *holy city*. Princes formerly made a practice of going to signalize their religion in the *holy land*; who would have manifested the more genuine spirit of religion by staying at home. See *CRUSADE*.

In Romish countries, one third part of the year is taken up in *holy days*, *fairs*, &c. See *FEASTS*.

Urban VIII. issued out an edict in the year 1643 for diminishing the number of *holy days*.

In Scotland they observe no fixed *holy days*, besides Sundays.

HOLY, *pro*. See *FIRE*.

HOLY Thursday is what we otherwise call *Ascension day*.

HOLY week is the last week of Lent, called also *PASSION-week*.

HOLY year is sometimes used for the year of *JUBILEE*. In the Jewish tabernacle, and afterwards in the temple, there were two places; the one called the *holy*, *sanctum*; and the other, which was more retired, the *holy of holies*, *sanctum sanctorum*, or the *SANCTUARY*.

The *holy* was separated from the *holy of holies*, by a veil. In the latter place was the ark of the covenant kept.

HOLYNES is also a title or quality, attributed to the *POPE*, as that of majesty is to kings.

Anciently the same title, *holyness*, was given to all bishops; as appears in St. Augustine, Fortunatus, Nicholas I. Cassiodorus, &c. St. Gregory compliments some of his contemporary bishops with your beatitude, and your *holyness*.

The Greek emperors of Constantinople were also addressed under the title of *holyness*, on account of their being anointed with *holy oil* at their coronation. Du-Cange

adds,

said, that some of the kings of England have had the same attribute; and that the Orientals have frequently refused it to the pope.

HOLY GHOST, order of the, is a military order in France; the principal in point of dignity in that kingdom.

It was instituted by king Henry III. in 1569, in memory of three great events happening on the same day; viz. his birth, accession to the crown of France, and election to that of Poland: the order is to consist of a hundred knights only; who, to be admitted, are to make proof of their nobility for three descents.

The king is the grand-master, or sovereign, and takes the oath as such on his coronation day; whereby he solemnly vows to maintain, for ever, the order of the *Holy Ghost*; and not to suffer it to sink, fall, or diminish, so long as it is in his power to hinder it; nor ever to attempt to alter or dispense with any of the irrevocable statutes of the order.

The knights are all to wear a gold cross hung about the neck by a blue silk ribbon, or collar; and the officers and commanders are also to wear a cross sewed on the left side of their cloaks, robes, and other upper garments. Before they receive the order of *Holy Ghost*, that of St. Michael is conferred, as a necessary degree; for which reason their arms are surrounded with a double collar.

HOLY GHOST, cross of the, in *Heraldry*, consists of a circle in the middle of a cross, and on it the *Holy Ghost*, in figure of a dove: the four arms are drawn narrow from the centre, and widening to the ends, where the returning lines divide each of them into two sharp points; upon each of which is a pearl.

From the intervals of the circle between the arms issue four fleurs-de-lis. This is the cross worn by the knights of the order of the *Holy Ghost* in France.

HOLY-ROOD day, a festival observed by the Roman catholics, in memory of the exaltation of our Saviour's cross. See **CROSS** and **EXALTATION**.

HOLY rule. See **RULE ROSE**.

HOLY thistle. See **BLISSED THISTLE**.

HOLY-WATER sprinkle, among *Hunters*, signifies the TAIL of a fox.

HOMAGE, in its general sense, denotes the reverence, respect, and submission, which a person yields his master, lord, prince, or other superior.

The word is formed of the Latin *homo, man*; because when the tenant takes this oath, he says, *Ego devotus homo vestro, I become your man*; for the same reason *homage* is called *manhood*; so the *homage* of his tenant, and the *manhood* of his tenant, are the same. Coke on Litt. fol. 64.

HOMAGE, HOMAGIUM, HOMINIUM, in *Law*, is an engagement or promise of fidelity; which the vassal, or tenant, who holds a fee, renders to the lord, when admitted thereto.

In the original grants of lands and tenements, by way of fee, the lord did not only oblige his tenants to certain services, but also took a submission, with promise and oath, to be true and loyal to him, as their lord and benefactor.

This submission, &c. is called *homage*; the form whereof, as appointed by stat. 17 Edward II. is in these words: When a free-man shall do *homage* to his lord, of whom he holdeth in chief, he shall hold his hands together, between the hands of his lord, and shall say thus: "I become your man, from this day forth, for my life, for member, and for worldly honour; and shall owe you my faith, for the land I hold of you; saving the faith that I owe unto our sovereign lord the king, and to mine other lords."

In this manner the lord of the fee, for which *homage* is due, takes *homage* of every tenant, as he comes to the land, or fee. Glanvil, indeed, excepts women; who only perform *homage* by their husbands; because *homage* is supposed to have a more immediate relation to service in war; but Fitzherbert denies this exception. Nat. Breve, fol. 157.

It is added, that bishops do no *homage*, but only fealty; and probably for the same reason as women. Yet do we read, that the archbishop of Canterbury does *homage* on his knees to our kings, at their coronation; and that the bishop of Man is *homage* to the earl of Derby.

Fulbeck reconciles this; by our law, says he, a religious man may do *homage*, but may not say to the lord, *Ego devotus homo vestro*; because he has already professed himself to be only God's man; but he may say to him, "I do unto you homage, and to you shall be faithful and loyal."

Homage and **FEALTY**, or faith, are two distinct things, and different duties.

Originally *homage* was performed by the gentlemen, and fealty by the peasant. Others say, that *homage* was that

performed to the lord himself, and fealty to his feudalists or steward, for his lord. It is added, that he who holds lands for term of life, owes *homage*, but not fealty. Bishops take the oath of fealty and loyalty to the king, for the temporalities they hold of him; but without *homage*, or vassalage.

HOMAGE-take, a more extensive kind of *homage*, whereby the vassal held of the lord, not only for his land, but for his person; so that the lord might use him against all mankind, whether within or without the kingdom; excepting against the king. See **LEIGE**.

This kind of *homage* was rendered bare-headed, with the hands joined on the Gospels, and one knee on the ground, and without sword, girdle, or spur. By which it was distinguished from *free homage*.

There are also other distinctions of *homage*, as,

HOMAGE, plain, or homage of a fee; where no oath of fidelity is taken.

HOMAGE of devotion, which is a donation made to the church; and does not import any duty, or service at all.

HOMAGE of peace, which a person makes to another after a reconciliation, as an assurance, that he will no longer disturb his peace, &c.

HOMAGE, again, is divided into *new*, or that performed upon the grant of the fee; and *ancient*.

HOMAGE, ancient, is where a man and his ancestors, time out of mind, have held their land of the lord, and his ancestors, by *homage*.

If such lord have received *homage*, he is bound to assist the tenant against all other lords above him, of every manner of service; and if the tenant has done *homage* to his lord, and is impleaded, and vouches the lord to warranty, the lord is bound to warrant him; and if the tenant lose, he shall recover in value against the lord so much of the lands as he had at the time of the voucher, or any time after.

HOMAGE is also used for a jury, in a court-baron, because, commonly consisting of such as pay *homage* to the lord of the fee. See **JURY**, **COURT-BARON**, and **MANOR**.

HOMAGE is also taken, in some cases, for the particular place, or district, where the services are to be performed.

HOMAGER, a person that does, or is bound to do *homage*, to another.

HOMAGIO respectanda, a writ issued out to the escheator, commanding him to deliver seisin of lands to the heir that is of full age, notwithstanding his *homage* not being done.

HOMAGIUM reddere has been used to signify, to renounce *homage*; as where the tenant or vassal made a solemn declaration of disavowing his lord, for which there was a form prescribed by the feodatory laws.

HOMER, in *Sea Language*, denotes either the situation of some object, where it retains its full force of action; or where it is properly lodged for convenience or security. In the former sense it is applied to the sails, and signifies, that their clut or lower corners are close to the blocks upon the yard-arms, immediately beneath them; hence, to haul *home* the top-sail-sheets, is to extend the bottom of the top-sail to the lower yard, by means of the sheets. In the latter sense, it usually refers to the fowling of the bold; as a cask, &c. is said to be *home*, when it bears against and lies close to some other object; or to the anchor, which is said to come *home*, when it loosens from the ground, by the effort of the cable, and approaches the place where the ship floated, at the length of her moorings. Mar. Dict.

HOMER, OMER, or CHOMER, a Jewish measure, containing the tenth part of the *ephah*. See **CORUS** and **MEASURE**.

HOMESOKEN, or rather **HAMSOKEN**; sometimes also written **HAMSOKA**, and **HAMSOKNA**, the privilege or protection which every man enjoys in his own house.

Hamsokne, hoc est quatuor esse de antierimanti pro ingressu hospitii volentis. Et sine licentia eorum pacem regis, et quod tenentis placita de huiusmodi transgressum in curia vestra. W. Thorn. 2030.

Hence, he who invades that freedom, is properly said, *frangere hamsoknem*.

This crime seems to amount to what we now call **BURG-LARY**; which is a crime of a heinous nature, as being not only a breach of the king's peace, but a breach of that liberty which a man hath in his own house, which, as we commonly say, should be his castle, and therefore ought not to be invaded. Bracton lib. iii.

HOME-STALL, a mansion-house, or seat, in the country. Russ.

HOMICIDE, of *homo, man*, and *caedo, I kill*, in *Common Law*, the killing of a man.

Homicide is divided into *voluntary* and *casual*.

HOMICIDE, *casual* is either *merely casual*, or *manus*. *Merely casual* is when a person kills another by pure mischance, being about his lawful occasions; as in the case of an ax slipping

slipping out of a man's hand, or falling off the beave while he is felling a tree.

It is accounted *murder*, when there is a negligence, or some other unwarrantable circumstance, attending the action. See MANSLAUGHTER.

HOMICIDE, *voluntary*, is that which is deliberate, and committed with a set purpose, and mind to kill; and is either with a precedent malice or without. The former is murder, which is a felonious killing, with malice premeditated, any person in the realm, living under the king's protection. See MURDER.

Judge Blackstone has distinguished *homicide* into three

* *kinda* viz. *justifiable*, *excusable*, and *felonious*.

Justifiable homicide is such as is owing to some unavoidable necessity, without any intension or negligence in the person that kills, and therefore, without any shadow of blame. Of this kind is the act of a magistrate, or officer, who puts a malefactor to death, in obedience to the law, and in the execution of public justice. *Homicide* is also *justifiable* for the advancement of public justice; as, where an officer, in the execution of his office, either in a civil or criminal case, kills a person that assaults or resists him; where an officer, or any private person, attempts to take a man charged with felony, but is resisted, and in the endeavour to take him, kills him; where officers, in case of a riot or rebellious assembly, endeavouring to disperse the mob, kill them; such officers are justified both by common law, and by the civil act, 1 Geo. I. cap. 5. Where prisoners are killed by the gaoler or officer, in endeavouring to prevent their escape; where trespassers in forests, parks, chases, or warrens, refuse to surrender to the keepers, they may be slain. 21 Edw. I. stat. 2. 3 and 4 W. and M. cap. 10. But in all these cases there must be an apparent necessity, without which this kind of *homicide* is not justifiable. When one champion killed another in battle, such *homicide* was justifiable, and was imputed to the just judgment of God. Moreover, such *homicide* as is committed for preventing any forcible and atrocious crime, is justifiable by the law of nature, and by the law of England. 24 Hen. VIII. cap. 25. Thus if any person attempts a robbery or murder, or endeavours to break open a house in the night-time, or to burn it, and should be killed in the attempt, the slayer shall be acquitted and discharged. This is agreeable to the Jewish law, Exod. xxi. 2. to the laws of Athens, and the Roman law of the Twelve Tables. The English law also justifies *homicide* in defence of chastity.

Excusable homicide is such as the law excuses from the guilt of felony, though it implies some degree of fault and blame. This is either *per infortunium*, by misadventure (see CAPITAL MURDER, above), or *se defendendo*, upon a principle of self-preservation in a sudden affray. See CHANCE-MEDLEY.

With regard to this, it is proper to observe, that the term has been often erroneously applied to any manner of *homicide* by misadventure; whereas by 24 Hen. VIII. cap. 5. and our ancient books of law, it is properly applied to such killing as happens in self-defence, on a sudden encounter. The true criterion between manslaughter and chance-medley, says Judge Blackstone, seems to be this, when both parties are actually combating at the time when the mortal stroke is given, the slayer is then guilty of MANSLAUGHTER; but, if the slayer hath not begun to fight, or, having begun, endeavours to decline any farther struggle, and afterwards, being closely pressed by his antagonist, kills him, to avoid his own destruction, this is *homicide* excusable upon self-defence; and therefore, the law requires, that the person, who kills another in his own defence, should have retreated as far as he conveniently or safely can, to avoid the violence of the assault, before he turns upon his assailant; besides, if the person assaulted does not fall upon the aggressor till the affray is over, or when he is running away, this is revenge and not defence. These two species of *excusable homicide* are similar in their blame and punishment. They formerly incurred a forfeiture, as some say, of all their goods and chattels; according to others, only of part of them, by way of fine or *WEREGILD*, which was probably disposed of, as in France, *in pars usus*, or for the benefit of his soul. But the delinquent has now a pardon, and writ of restitution of his goods, as a matter of course and right, only paying for suing out the same; and in most cases the judge will grant a general verdict of acquittal.

Felonious homicide is the act of killing a human creature, without justification or excuse. This is either self-murder (see FUGIO DE SE); or the killing of another man, which is divided into MANSLAUGHTER and MURDER. Blackst. Com. book iv. chap. 14.

HOMILY, *Oratio*, formed of *homos*, assembly, originally signifies a conference, or conversation; but the word has Vol II. N° 173.

since been applied to an exhortation, or sermon, delivered to the people.

The Greek *homilia*, says M. Fleury, signifies a familiar discourse, like the Latin *sermo*; and discourses delivered in the church took these denominations, to intimate that they were not harangues, or matters of ostentation and flourish, like those of profane orators, but familiar and useful discourses, as of a matter to his disciples, or a father to his children.

All the *homilies* of the Greek and Latin fathers are composed by bishops. We have none of Tertullian, Clement Alexandrianus, and many other learned persons; because, in the first ages, none but bishops were admitted to preach.

The privilege was not ordinarily allowed to priests, till toward the fifth century. St. Chrysostom was the first presbyter that preached *homilies*; Origen and St. Augustine also preached, but it was by a peculiar licence, or privilege.

Phoebus distinguished *homily* from *sermon*; in that the *homily* was performed in a more familiar manner; the presbyter interrogating and talking to the people, and they, in their turn, answering and interrogating him; so that it was properly a conversation; whereas the sermon was delivered with more form, and in the pulpit, after the manner of the orators.

There are several fine *homilies* of the fathers still extant; and particularly of St. Chrysostom, St. Gregory, &c. The practice of compiling *homilies*, which were to be committed to memory, and recited by ignorant or indolent priests, commenced towards the close of the eighth century; when Chalmagne ordered Paul Deacon and Alcuin to form *homilies* or discourses upon the Gospels and Epistles, from the ancient doctors of the church. This gave rise to that famous collection, entitled the *Homiliarium* of Chalmagne, and which being followed as a model by many productions of the same kind, composed by private persons, from a principle of pious zeal, contributed much (says Mosheim) to nourish the indolence, and to perpetuate the ignorance of a worthless clergy. Eccles. Hist. vol. II. p. 84. 8vo. ed. 1768.

At the time of the Reformation there were several of these *homilies* composed and printed, and ordered to be read in such churches as were not provided with a sufficiently learned minister, in order to prevent unfound doctrine being taught in remote country places.

HOMILIES, *Clementine*, in *Ecclasiastical History*, are nineteen *homilies* in Greek, published by Coesetius, with two letters prefixed; one of them writ in the name of Peter, the other in the name of Clement, to James bishop of Jerusalem; in which last letter they are entitled Clement's Epistles on the Preaching and Travels of Peter. According to Le Clerc, these *homilies* were composed by an Ebionite in the second century; but Mosheimus supposes that they were forged long after the age of St. Athanasius. Dr. Lardner apprehends, that the *Clementine Homilies* were the original or first edition of the Recognitions; and that they are the same with the work centred by Eusebius under the title of Dialogues of Peter and Appion. Credib. of the Gospel Hist. vol. IV. p. 809, &c.

HOMINE capto in uiltherum, a writ for apprehending him that has taken any bondman or woman, and led him or her out of the country; so that he or she cannot be recovered according to law. See WITHEANAM.

HOMINE eligendi ad custodiendum pacem sibi per mercatibus actis, in Law, a writ directed to a corporation for the choice of a new person to keep one part of the seal appointed for *statuti merchant*, when a former is dead, according to the statute of Acton Barnel.

HOMINE replegiandi, a writ for the bailing of a man out of prison, when he is confined without commandment of the king or his judges, or for any cause that is repleviable. But this writ is now seldom used; a writ of *HABERE corpus* being fled out on the necessary occasions.

HOMINICOLÆ, formed of the Latin *homo*, homin, man, and *colis*, I worship, in Antiquity, a name which the APOLLINARIANS gave to the orthodox, to denote them worshippers of man.

As the orthodox maintained, that Jesus Christ was God-man, the APOLLINARIANS accused them of adoring a man, and therefore called them *hominicolas*.

HOMMOC, in Sea Language, signifies a bilcock, or small eminence of land, resembling the figure of a cobe, and appearing on the sea-coast of any country.

HOMO, *Man*, in Zoology. See MAN.

HOMOCENTRIC, composed of *homos*, similar, and *centros*, centre, in Astronomy, a term of the same import with CONCENTRIC.

HOMOCHROA, in Natural History, the name of a genus of PERLETS.

The word is derived from the Greek *homos*, similar, and

green, yellow, and expresses such pebbles as are not related but all of one simple and similar colour. These are bodies composed of crystalline matter, considerably debased by earth, and this of various kinds in the different species, but only of one kind in the same species, which is thence, always of one colour, and not subject to veins. Of this genus there are only five known species; the white, red, yellow, black, and greenish. All these are covered with external coats or crusts, like those of the common pebbles. *Hill's Hist. of Foss. p. 510.*

HOMODROMUS *verbi*, in *Algebra*, a lever, in which the weight is in the middle between the power and fulcrum, or the power in the middle between the weight and fulcrum. See *Tab. Algebrae*, fig. 2. and 3.

The word *homodromus* is derived from *homo*, same, and *dromos*, course, because in this species of lever the weight and power move in the same direction; as in the *heterodromus* they move in contrary directions.

HOMOEOTELEUTON, *Quasi-syntaxis*, a figure in *Rhetoric*, whereby several verbs in a sentence are made to end alike; as, *et alibi, etiam quam ferunt malis.* Or, *ut vires incantatis, dantesque fides, sequenti malis.*

HOMOGENEOUS, or **HOMOGENEAL**, composed of the Greek, *homo*, like, and *genea*, kind, is a term applied to various subjects, to denote, that they consist of similar parts, or of parts of the same nature and kind: in contradistinction to heterogeneous, where the parts are of different natures, &c.

Natural bodies are generally composed of *homogeneous* parts, as a diamond, a metal, &c. Artificial bodies, on the contrary, are assemblies of heterogeneous parts, or parts of different qualities; as a building, of stone, wood, &c.

HOMOGENIAL light, is that whose rays are all of one and the same colour, degree of refrangibility, and reflexivity. See **LIGHT**.

HOMOGENEAL numbers and places, are those of the same kind and nature.

HOMOGENIAL forms, are such as have one common radical sign; as $\sqrt{27}$, and $\sqrt{3}$. See **SURD**.

HOMOGENEUM *comparativum*, in *Algebra*, the known quantity in an *EQUATION*; called also *absolute number*. It is called *homogeneous* *comparativum*, of *comparison*, to distinguish it from the other terms; which though *homogeneous* as well as this, i. e. always raised to the same degree of power, are not the quantities to which things are here compared or referred.

HOMOGRAMMII, *Quasi-syntaxis*, among the *Antients*, an appellation given to the athletes who drew the same letter, and on that account were to engage together; for when any number of athletes were to enter the lists, in order to determine with whom every one should contend, they threw into an urn a number of letters equal to that of the athletes, but so that there were always two letters of a sort, as two *A's*, or two *B's*. After these had been shaken together, the athletes drew them out, and those who got the same letter were to fight each other.

HOMOICATALECTON, *Quasi-syntaxis*, in *Rhetoric*, a figure wherein the different parts of a sentence have the like termination.

Homocatalecton is used as a genus to denote similar terminations and words; and *homocatalecton* and *homocatalecton* are made its species.

HOMOIOMERICAL *principles*, of *Algebra*, *similar*, and *parts*, a peculiar kind of principles, supposed by *Anaxagoras* in all mixed bodies; being determinate numbers of such similar principles, as when they came to be parts, e. g. of an animal body, would there make such masses and combinations as their nature required; viz. the tanginary particles would then meet together, and make blood, the arinous particles constitute urine, the effluens ones bones, the carnosous flesh, &c. See **PARTICIPLE**.

HOMOIOPTOTON, *Quasi-syntaxis*, a figure in *Rhetoric*, whereby the several parts of a sentence end with the same case, or tense of a like sound; as *gr. marem, flentes, lachrymentes, & miserantes.* Iocates is particularly celebrated for this figure. Some of the best orators have indistinctly avoided this figure, because it has too much the appearance of art.

HOMOLINON, a word used by some authors to express crude flax, and by others for a coarse sort of flaxen linen, made of the rough threads unwhitened, which was used by the ancients for towels to rub people after bathing.

HOMOLOGATION, in the *Civil Law*, the act of confirming or rendering a thing more valid and solemn, by publication, repetition, or recognition thereof.

The word comes from the Greek *homologia*, *confessio*, *assensio*, formed of *homo*, similar, like, and *logos*, of *ratio*, *discursus*, to say, q. d. to say the same thing, to confess, agree.

HOMOLOGOUS, in *Geometry*, is applied to the correspondent sides of similar figures, which are said to be *homologous*, or in proportion to each other.

The word is composed of *homo*, similar, and *logos*, ratio, reason; q. d. quantities *analogous* to each other in ratio. So, if the ratio of A to B be the same as of C to D, here A is *homologous* to C, as B to D; because of the similitude between the antecedents and consequents. The two antecedents, and the two consequents, then, in any continued geometrical proportion, are *homologous* terms.

Thus, the base of one triangle is *homologous* to the base of another similar triangle; for, in similar triangles, the sides opposite to equal angles are said to be *homologous*. Equiangular, or similar triangles, have their *homologous* sides proportional.

All similar triangles, rectangles, and polygons, are to each other as the squares of their *homologous* sides.

HOMOLOGOUS things, in *Logic*, are such as agree in name, but are of different natures. These coincide with what we otherwise call *equivocal*, and *homonymous* terms.

HOMONOPAGIA, a word used by four medicinal authors for the *HEADACHE*.

HOMONYMIA, in *Logic*, an *equivocation*. See **HOMONYMUS**, &c.

HOMONYMUS, *Quasi-syntaxis*, composed of *homo*, similar, and the Ionic *onymos*, let names, name, in *Logic*, a word which has different meanings, or which is used to express things of different nature, and quality.

Homonymy are the same with what are otherwise called *polysemia*, *synonyma*, and *equivocalia*.

HOMOIOUSANS, **HOMOIOUSIANS**, **HOMOIOUSIANISTS**, **HOMOIUSTAE**, formed of *homoios*, or *homoiosus*, signifying of the same substance, are names which the *Arians* anciently gave to the orthodox, because they held that God the Son is *homoiousios*, i. e. *consubstantial* with the Father. *Huneric*, king of the Vandals, who was an *Arian*, published a rescript, directed to all the *Homoiousian* bishops. See **PERSON**, &c.

HOMOIOUSIOS, *Quasi-syntaxis*, among *Divines*, a being of the same substance or essence with another.

The divinity of Christ having been denied by the Ebionites and Cerinthians in the first century, by the Theodotians in the second, by the Aetionians at the beginning of the third, and by the Samaritanians, or Paulians, towards the close of the same, a council was assembled at Antioch, in 169, wherein Papias Samaritanus, head of this last sect, and bishop of Antioch, was condemned and deposed, and a decree published, as some have said, wherein Christ is asserted to be God of God, and *homoiousios*, i. e. *consubstantial* with the Father.

It has been urged by several ancient writers of the fourth century, viz. Athanasius, Hilary of Poitiers, and Basil, that the council of Antioch rejected the word *homoiousios*, or *consubstantial*, as improper; and if we consider that Eusebius, who has been called an *Arian*, speaks of *Malchion*, who directed and governed at this council, as a man of uncommon foundation in the faith of Christ, we may presume, that the term was not introduced in this council. The council of Nice, however, assembled in 325, expressly disclaimed the *Homoiousian* doctrine. Many learned writers have taken pains to vindicate the orthodoxy of the council of Antioch, and to shew, that both these councils held the same doctrine. See **ARIANS**.

HOMOPHAGI. See **OMOPHAGI**.

HOMORHONOUS, in *Music*, is said of two or more chorals, strings, or voices, that are of the same pitch or tune, or of an unison.

HOMORIUS, in *Mythology*, is an epithet given to Jupiter by the Greeks, answering to *Terminus* among the Romans. *Polyb. Hist. lib. ii.*

HOMOTONOS, in *Medicine*, an epithet made the characteristic of a certain kind of fever, which continue from the beginning to the end in one equable and uniform tenor without exacerbation or relaxation.

HOMUNCIONALIS, an appellation given by the *Arians* to the orthodox, who said there were two natures and substances in Christ.

HOMUNCIONISTS, **HOMUNCIONISTS**, formed of *homunculus*, a diminutive of *homo*, man, q. d. little man, a sect of heretics, the followers of Photinus, and from him also called **PHOTINIANIS**.

They had this appellation, because of their denying the two natures in Jesus Christ, and holding that he was only mere man.

HOMUNCIONITES, **HOMUNCIONITES**, were a sect of ancient heretics, whose distinguished dogma it was, that the image of God was impressed on the body, not on the soul or mind of man.

HOND-HABEND. See **HAND-HABEND**.

HONE, a fine sort of white stone, used for setting razors, penknives, &c. This is the *concretio* of Linnæus with small gritty particles. See **OUR-SINK**.

It is of a yellowish colour, and is voluently, but erroneously, supposed to be Holly-wood petrified or changed into stone, by lying in a petrifying water for a certain season.

Of these waters there are said to be some in Oxfordshire, that will thus petrify in a very short time.

HONES, *bed of*, or *HONE-PAVEMENT*, is one of the tools used in the operation of grinding specula for telescopes. This is formed of pieces of the finest blue *hone* or whetstone, which are nearly of the same breadth and thickness, and which, when wetted, appear most even and uniform in their colour and grain. These pieces are to be cut into square bits, and, having ground one side of each concave on the convex marble to which they are to be applied, with emery or fine sand, they are to be cemented upon this thick round piece of marble in a kind of pavement, leaving a space of a small straw's breadth between each, and placing their grain in an alternate direction. Mr. Mudge, instead of marble, uses metal made of lead and tin, on which the *hones* are to be so disposed, that the lines between them may run frain from one side to the other; and by this disposition, the teeth of a fine saw, moved along each of the divisions, will clear away the cement which rises between the stones. This bed of *hone* should be at least a fourth part larger than the metal which is to be ground upon it. The surface of the metal, upon which it is to be cemented, may or may not, at the pleasure of the workman, be turned of a convexity suitable to the gage. As soon as the *hones* are cemented down, and the joints cleared by the saw, the tool must be fixed in the lathe, and turned as exactly true to the gage as possible. By this instrument the spherical figure of the speculum is completed, and its surface is rendered fit for the polisher. See *Tab. II. Optics*, fig. 30. Smith's *Optics*, book iii. chap. ii. art. 791. Phil. Trans. vol. lxxv. part i. p. 307. See **GRINDING**.

HONE WORT, in *Botany*, a species of *Hyssopus*. See *Barbarea* *HYSSOPUS*.

HONESTY, *SATTIN-FLOWER*, or *MEAN-WORT*, *lanaria*, in *Botany*, a genus of the *tetraneurina* *falsculia* class. Its characters are these: the flower has four petals placed in form of a cross, which are entire; and it has six awl-shaped stamens, four of which are the length of the corolla, the other two shorter; it has an oblong oval germin, which becomes an erect, plain, compressed, elliptical pod, sitting upon a small foot-stalk, terminated by the style, having two cells opening with two valves which are parallel, including several compressed kidney-shaped seeds, which are bordered, sitting in the middle of the pod. Müller enumerates four species, and Linnaeus only two.

These plants grow in almost any kind of soil, require little culture, but love a shady situation. This plant is famous in some parts of the kingdom for its medicinal virtues, though it has not the fortune to be received in the shops. The people in the northern countries dry the whole plant in an oven, and give as much as will lie on a shilling for a dose, twice a day, in hæmorrhages of all kinds, particularly in the too abundant flowing of the menses, and with great success. The Welch, among whom it is not uncommon, Dr. Needham informs us, make an ointment of it, which they use externally, and pretend it cures dysenteries.

HONEY, *mel*, is a sweet vegetable juice, collected by the bees from the flowers of different plants, and deposited in the cells of the combs.

It has been long known, that the bees collect their *honey* as well as their wax from the flowers of plants; but former writers had no distinct knowledge of the several parts of the flowers which furnished their industrious insects with two such different substances. It is now known, that the *honey* is procured from those parts of the flowers which were first discovered by Linnaeus, and to which he has given the name of *nectaria*: these are certain vessels or glands situated near the basis of every petal, and continually secreting a nectarous or mellaceous juice. It is not yet ascertained from what part of the flower or plant the bees collect the wax: some have supposed that it is furnished by the farina contained in the spikes of the flowers; but Mr. Polkitt, an ingenious friend of the editor, of whose extensive and accurate acquaintance with the economy of bees he has availed himself in articles pertaining to this subject, assures him, that this is not the case; and that it is still undiscovered from whence they procure the wax.

The bee *scizes* upon this part of the flower, and sucks from it either *honey*, or a juice of that nature, which will become *honey* under her management. She receives this into her body, and carries it home to the hive, where she unloads herself, by emptying it into the cells which were before prepared to receive it. The bee does not receive the *honey*, in collecting it from the flowers, into the body by means of her trunk, as many have supposed; for this trunk serves only to collect the sweet juice, in small drops, from the nectaria of flowers. When the trunk is thus loaded with the juice or *honey*, it deposits

it on the tongue, which is exerted for that purpose, and being drawn back into the mouth, conveys it into the oesophagus. The oesophagus of the bee is a long and slender canal, passing from the mouth into the thorax towards its termination in that part, it is dilated into a sort of bag, which forms the first stomach of the bee. Marshall supposed the receptacle of the *honey* to be a bag, closed at the lower end, and only destined to receive the *honey*, and discharge it again upon occasion; but Swammerdam, on a more accurate dissection of this insect, found it to be a real stomach, opening into another or second ventricle. The first stomach, when empty, is no more than a white filament, which, being hollow, is capable of receiving the *honey*; and, when received, it becomes faxated and dilated in proportion to the quantity it contains, and is very narrow at its lower part, where it is joined to the second stomach. This is a sort of white transparent bladder, and is usually much dilated, and so covered with large and broad circular muscles, that it seems to resemble a tub with many hoops. This stomach becomes again very slender and narrow at its lower end, where it is joined to the intestines. The second stomach and the intestines of the bee are often found to contain a great quantity of the farina; but the first stomach contains only *honey*, and is, fern, by dissection, to be furnished with all the organs of contraction and distension, which are necessary for throwing out its contents. When the *honey* has undergone a kind of concoction in the stomach, and it becomes much thicker than in its undigested state (though the gentleman already referred to apprehends, that it undergoes no kind of change in the stomach of the bee), it is disgorged again through the mouth, and not, as Swammerdam erroneously imagined, through a small orifice in the end of the trunk. The process of this operation may be easily discovered in glass tubes, where the cells reach to the glass, and have only four lines of wax, the plug serving for the other two lines.

The bee, that comes loaded to the cell, thrusts its head very deep into it, and discharges the *honey* from its stomach in a very little time, and seemingly with very little trouble, by the mouth. One bee succeeds another, till the whole cell is filled. In this work, it has been often observed, that what appears to be the last quantity of *honey* disgorged into the cell is always of a different appearance from the rest: this is of the nature of a cream, and is always much thicker than the rest of the *honey*, which appears of one colour and consistence; it seems to be very useful in the economy of the work, serving at once to keep the *honey* moist, and to prevent its running out by any accident. Though this cream or crust appears to be the last voided quantity, it is not so in reality, for it seems to have been gathered together from the first; and every fresh quantity of *honey* is added under, not upon its surface. To this purpose it is always observed, that the bee, which comes loaded to the cell, does not at once discharge its *honey* into it, but, entering into the cell as deep as possible, it puts forward the anterior pair of legs, and with them pierces a hole through the crust or cream. While this hole is kept open by the feet, the bee disgorges the *honey* in large drops from the mouth; these falling into the hole made by the feet, mix with the mass below, and the bee, before it flies off, new models the crust, and closes up the hole; and this is regularly done by every bee that contributes to the general store of the cell.

The several cells of the combs in every hive are differently filled with *honey*, and for different purposes: some is laid up for immediate consumption, on occasions of bad weather and the like accidents, or for the use of those bees that in good weather fly at home to work, and are not supplied in any other way by those which have been abroad collecting *honey*; and some is more carefully preserved and destined for the support of the swarm in the winter. Whenever any cell is filled with *honey*, it is always closed up and never opened again, till all the *honey* in the cells which were not full is expended. The manner in which the bees make the lids or covers of the cells is this: they form a circle or ring of wax just within the verge of the cell; to this they add another such ring, and then another within that; and thus the aperture is rendered smaller and smaller, and by a continuance of the same operation is finally closed, the lid being composed of a vast number of concentric circles. This covering is designed for preserving the inclosed *honey* in a state of proper consistence, for a winter store.

Honey has been supposed by many to be the only food of the bees who collect it; but this is evidently erroneous. The farina of flowers serves as food for young bees, whilst they are in the form of maggots, but it is not in certain whether the old bees eat it or not; after which some say it is again thrown out at their mouths in form of wax, and used in the structure of their cells; but others

calers absolutely deny this, because the farina of different flowers varies in colour, whereas the wax is uniformly white.

Hony and *wax* form so considerable an article in the riches of a kingdom, that M. Reaumur strongly recommended to the court of France the encouragement of those who raise swarms of bees, by deducting something from their taxes in proportion to every hive of bees kept by them above a certain number. And as bees are so easily raised, and kept with so little expense and trouble, it is a wonder that they are not more generally propagated in this kingdom. One great means of preserving and multiplying the bees would be the abolishing of that barbarous as well as prejudicial custom, which has hitherto very generally prevailed, of destroying the whole hive of bees in order to obtain the *hony*. Reaumur's Hist. Nat. vol. x. p. 89, &c. See *Hive*.

There are many circumstances necessary to the forming of good *hony*, such as a warm and clear air, a good state of health of the bees, and a quantity of aromatic and sweet flowers in the neighbourhood of their hives. Some naturalists suppose that *hony* is of a different quality, according to the difference of the flowers and plants from which the bees suck it. The ancients esteemed that of lilies and roses to be the best; and Strabo relates, that there is a kind of *hony* in Pontus which is a strong poison, being procured by bees which feed upon acorn and hemlock. F. Lambert, however, assures us of the contrary, and asserts it to be the best *hony* in the world, on account of the great quantity of gum that grows there. He adds, that there is another very white kind of *hony*, hard as sugar, which does not stick to the hands. At present, the *hony* of Narbonne, in France, is held to excel all others, on account of the rosemary which abounds there. Bees are uncommonly fond of the lime-tree, the privet, and phillyrea; and in Lithuania, there are large quantities of wild bees, who lodge in hollow trees in woods, and collect their *hony* chiefly from the lime; so that when the season happens to be unfavourable at the time of the blowing of the lime, it is succeeded by a scarcity of *hony*. However, it is not to be supposed, that the bees confine itself to one particular flower; nor does it appear, that the *hony* collected from one kind of flower differs essentially from that which is the produce of another; the only difference being in the quantity, colour, or some light flavour. From the flower of the *lily* has been produced where nothing grew but nettles and other weeds. The *hony* taken out of the hives in the beginning of summer is preferable to that gathered in autumn, since the first is the season in which the bees are most vigorous, and the plants in their flowering state.

We have two kinds of *hony*, the *white* and *yellow*. The *white*, *mel album*, called also *virgin honey*, is that deposited in clean new cells, which, when first formed, are of a pure white colour; but when the combs are old, especially if bees have been bred in them, they become foul and discoloured, and vitiate the *hony* lodged in them. New *hony* is nearly as fluid as water; by age it acquires a greater degree of consistence, and the cold of winter frequently congeals it. The second kind, or *mel flavum*, is squeezed from the combs in a press, after having first softened them with a little water over the fire. There is also an intermediate sort of a yellowish white colour, drawn by expression, without fire. That which runs spontaneously is purer than the expressed; a quantity of the wax and other impurities being forced out along with it by the pressure, especially when the combs are previously heated. The best sort of *hony* is of a thick consistence, easily and totally soluble in cold water, of a whitish colour, an agreeable smell, and a very pleasant taste.

Hony, exposed to a gentle heat, as that of a water-bath, becomes thin, and throws up to the surface its waxy impurities, together with the meal or flour sometimes fraudulently mingled with it, which may be thus separated by decantation, so as to leave the *hony* pure, and to form the *mel depuratum* or clarified *hony*. On continuing the heat, there rises a considerable quantity of aqueous fluid, impregnated with the fine smell of the *hony*; the insipidous residuum, like the *hony* at first, dissolves both in water and rectified spirit, and promotes the union of oily and resinous substances with watery liquors. By treating the insipidated mass with moist clay, as practised by the sugar-baker for purifying sugar from its unctuous treacly matter, the unctuous parts of *hony* may in like manner be separated, and its pure sweet matter obtained in the form of a solid, saline, white concrete.

This juice is a useful sweet for medicinal as well as domestic purposes: it is more aperient and detergent than the simple sweet prepared from the sugar-cane; and particularly serviceable for promoting expectoration in difficulties of the breast, and as an ingredient in cooling and

detergent gargarisms. For these and other similar intentions it is sometimes mixed with vinegar, and forms the *oxymel simple* of the shops; it is also impregnated with the virtues of different vegetables, by boiling it in the same manner with their juices or infusions, till the watery parts of the juice or infusion have exhaled and left the active matter incorporated with the *hony*. See *Oxymel compend.*

It is observed, that the boiling of *hony*, though it dissipates great part of its odorous matter, and thus proves in some cases injurious to it, is nevertheless in other cases of advantage. There are particular constitutions with which *hony* disagrees, and in which very small quantities occasion gripes, purging, and great disorder; but boiling deprives it of that quality which produces these effects. Neumann's Chem. by Lewis, p. 336. Lewis's Mat. Med. p. 376.

Hony contains a quantity of fixed air, and is susceptible as well as detergent and diuretic. Sir John Pringle recommends one pound and a quarter to be taken regularly every week in cases of the gravel, or when the kidneys are loaded with sand.

Hony is the basis of several compositions in pharmacy. Of *hony*, with the addition of roses or violets, mercurials, &c. is made *mel rosatum*, *mercuriale*, *belliteratum*, &c. There is also a *mel scillitimum*, or a preparation of squills; *mel pascuatum*, made with raisins boiled in hot water; and *mel anthosatum*, made with rosemary-flowers.

Hony is also an ingredient in several drinks, as *MUM*, *STRENGTHENING*, &c.

The chemists also draw a water, a spirit, an oil, &c. from *hony*.

Mr. Lemery, in his analysis of *hony*, observes, that two pounds of fine *hony* distilled in balneo Mariæ, afford six ounces of clear water of an insipid taste, and of the smell of *hony*: this is commonly called the dew of *hony*. A larger quantity of phlegm may be procured by continuing the distillation, but it becomes foul. This liquor, though insipid to the taste, yet contains a latent acid, for it reddens the turnsole; but it neither ferments with the volatile nor fixed alkalis. The cucurbit being now placed in a sand-heat, there come over four ounces of a yellowish pellucid water, of an acid taste, of a strong smell of *hony*, and somewhat empyreumatic: this liquor reddens the turnsole colour more than the former. The fire being increased, there arise white clouds, which fill the head of the cucurbit and the receiver, and these finally condense into a third liquor, which is called the spirit of *hony*. This will be about three ounces in quantity, and of a red colour and empyreumatic smell, yet with an agreeable flavour, and of an acid and burning taste. This is a stronger acid than either of the former, and ferments with an alkali.

The fire being again increased, more clouds arise, and, in fine, there is a fourth liquor produced; this is in quantity about two ounces, of an orange colour, and of an acid taste, but less acid than the third liquor, as it contains more oil, which softens and sweetens it. Like the former, it ferments with alkalis, and reddens the colour of turnsole. When the distillation is thus finished, there will remain in the cucurbit fifteen ounces and a half of a light spungy black coal. Mem. Acad. Par. 1706. This is to be then put into a retort for a fresh distillation, and a strong fire under this vessel will raise from it seven ounces of a reddish brown liquor, which stains the fingers to an orange colour, and of a burnt smell, yet with something agreeable in it, and of an acid and very acid pungent taste. Besides this, there come over two drams of a thick black oil, looking like tar; this also was of an acid taste, which was owing to some of the salts of the *hony* being blended with it. There is much more oil contained in the *hony*, but it does not come over separate, but blended with the other liquors; and after they have stood some days, precipitates itself from them, and is found sticking to the sides and bottom of the vessel. The matter remaining in the retort is about seven ounces of a black coal, of a light spungy texture, and of a taste almost insipid, and only seeming to contain a little salt.

We see by this process, that thirty-two ounces of *hony* yield twenty-four ounces and two drams of liquor, that being the difference in weight between the *hony* when first put in, and the last caput mortuum. Twenty-two ounces and six drams are the quantity here preserved of the several liquors, the rest having escaped through the junctures of the vessels, as will always be the case in such distillations. Id. Ibid.

The caput mortuum of this, and of several other distillations of *hony*, the whole making three pounds and a half, were put into an unglazed earthen pot, and calcined over the fire for ten hours; this readily took fire like common charcoal, and burnt till it lost ten ounces in weight, but without falling into ashes. The remaining coal had then a more saline taste than before. Any acid

acid liquor poured upon this fermented, as with the common alkalies; and when thrown into water to make a laviuim, it bubbled in the manner of quick-lime thrown into water; and, in the common way of making the fixative salts, this yielded a dram and a half of an acid alkaline one.

It is remarkable, that the calcined excrement of *honey* contains, like other vegetable ashes, true particles of iron, which adhere to a knife touched with a magnet.

HONEY, wild. St. Adam, abbot of Hii, in his description of the holy places, observes, that in the place where St. John Baptist lived in the Desert, there are locusts which the poor people boil with oil, and a sort of herbs with large long leaves of a milk colour, and a taste like that of *honey*; and that this is what in Scripture is called *wild-honey*. See *ACRIDOPHAGI*.

HONEY-BIRD. See *HUMMING-BIRD*.

HONEY-BEE, the English name of the *hues* *APIFORS*.

HONEY OF ROSES. See *ROSE*.

HONEY-COMB, a waxen structure, full of cells, framed by the bees to deposit their *honey*, eggs, &c. in.

The construction of the *honey-comb* seems one of the most surprising parts of the works of insects, and the materials of which it is composed, which though evidently collected from flowers of plants, yet do not, that we know of, exist in them in that form, have given great cause of speculation to the curious. The regular structure of the comb is also equally wonderful. When the several cells in it are examined, it should seem that the nicest rules of geometry had been consulted for its composition, and all the advantages that could be wished or desired in a thing of that kind are evidently found in it. The bees, in the structure of this receptacle of their *honey*, seem to have resolved a geometrical problem, far from an easy one, and indeed clogged with so many conditions, that it might have puzzled able proficient in that science. This may be expressed in these words: a quantity of wax being given, to form it into a number of angular and equal cells, of a determinate capacity, but the greatest that can be made with that quantity of wax, and, at the same time, that these cells shall be so disposed as to take up as little room as possible in the hive.

In order to this last condition, it is necessary that the cells touch one another, in such a manner, that there be no angular space nor cavity between them. The bees have effected all this by making the cells all hexangular, or tubes of five equal sides: triangular, quadrangular, and some other figures for the cells, might have been indeed so disposed between one another as to leave no space; but then an equal number of them could not be made with the same quantity of wax. The body of the bee being rounded, it will also be received into a hexangular cell, without leaving such large spaces as it must if received into a triangular or square one.

The method of making two sets of cells in each comb is also admirably contrived to save the expence of wax, since, had they been made single, every comb must have had its peculiar base, and every set of cells their bottom of wax; whereas one bottom now serves to two cells, and there is but one plate of wax in the center of a double comb. There is however this farther difficulty attending it, that the several cells are not so many hexagonal tubes with flat and broad bases, or tubes of an equal breadth all the way; but they are truly pointed at the bottom, being every one of them a hexagonal cell with a pyramidal base, and forming that kind of figure, as Maraldi and Reaumur first discovered, which requires the least wax for containing the same quantity of *honey*. Each of these bases is composed of three equal rhombuses, and each base, in this manner, becomes the base of three other cells on the opposite side of the comb.

This is easily demonstrated to those who understand geometry, by means of the several figures and positions of the opposite bases of the cells of the two sides of the comb; but the most familiar explication of it to a common observer, is to stick three small pins through the base of any one cell, each in the centre of the rhomb that makes one side of that base: If, after this, the comb be turned, the three pins will be found in the centers of three different cells of the opposite side.

The obtuse angles of the three equal rhombuses that form the base, are found to be the double of an angle (which often comes under consideration in questions relating to maxima and minima), whose tangent is to the radius as the diagonal is to the side of the square. By this construction, three of the six solid angles at the base, that correspond to the angles of the hexagon, are equal to each other, and also to the solid angle at the apex of the figure, each of which solid angle is respectively formed from three equal, plane, obtuse angles; and the other three solid angles are also equal to each other, but each of them is formed by four equal, plane, acute angles,

which are the supplements of the former obtuse angles. Monf. Maraldi found, by mensuration, that the obtuse angles of the rhombuses were nearly 110° , and observed, that if they were supposed equal to each other, each of them must be $109^\circ 28'$; and Mr. Koenig, by the method of infinitesimals, found, that this angle, in order to employ the least wax possible in a cell of the same capacity, ought to be $109^\circ 26'$. Mr. Maclaurin has also demonstrated, from the principles of common geometry that the most advantageous angle is that which results from the supposed equality of the three plane angles forming the solid angle. We shall subjoin the demonstration for the sake of the mathematical reader.

Let GN and NM (*Tab. II. Geometry, fig. 49 and 50.*) represent any two adjoining sides of the hexagon, or the section of the cell perpendicularly to its length. The sides of the cell are not complete parallelograms as CGNK, BMNK, but trapezia CGNE, BMNE, to which a rhombus CEBA is added at OE, that has the opposite point E in the apex of the figure; so that three rhombuses of this kind, with five trapezia, may complete the figure of the cell. Let O be the center of the hexagon, of which CK and KB are adjoining sides; Join CB and KO, intersecting in A; and, because COB is equal to CKB, and KE equal to O, the solid EBCK is equal to the solid EBCO; whence it follows, that the solid content of the cell will be the same, wherever the point E is taken in the right line KN; the points C, K, B, G, N, and M, being given. It is, therefore, necessary to enquire, where the point E is to be taken in KN, so that the area of the rhombus CEBA, together with that of the two trapezia CGNE, ENMB, may form the least superficies. Because EV is perpendicular to BC in A, the area of the rhombus is $AE \times BC$, and that of the trapezia $CG + EN \times KC$; the sum of these is $AE \times BC + 2KN \times KC - KE \times KC$; and because $2KN \times KC$ is invariable, we are to enquire when $AE \times BC - KE \times KC$ is a minimum?

Suppose the point L, to be so taken upon KN, that KL may be to AL as KC is to BC. From the center A describe in the plane AKE, with the radius AE, an arc ER meeting AL, produced, if necessary, in R: let EV be perpendicular to AR in V, and KH be perpendicular to the same in H; then the triangles LEV, LKH, LAH, being similar, we have $LV : LE :: LH : LK :: LA : LC :: KC : BC$ by the supposition. Hence, when E is between L and N, we have $LH + LV (= VH) : LK + LE (= KE) :: KC : BC$; and when E is between K and L, we have $LH - LV (= VH) : LK - LE (= KE) :: KC : BC$; that is, in both cases we have $KE \times KC = VH \times BC$; and consequently $A \times BC - K \times KC = A \times EV - BC \times V = A \times EV - V \times H \times BC = A \times EV - V \times H \times BC$; which expression, because AH and BC do not vary, is evidently least when VR vanishes, i. e. when E is upon L. Therefore CLB is the rhombus of the most advantageous form in respect of frugality, when KL is to AL as KC is to BC. But as OK is bisected in A, $KC = OK = 4AK$, and $BC = 2AC = 2 \times 3AK$; consequently $KC : BC :: 2AK : 2 \times 3AK :: 1 : 3$; and $KL : AL :: (KC : BC) :: 1 : \sqrt{3}$; or $AL : AK :: \sqrt{3} : 1$; and (because $AK : AC :: 1 : \sqrt{3}$) $AL : AC :: 1 : \sqrt{2}$; i. e. the angle CLA is that, whose tangent is to the radius as $\sqrt{2}$ to 1, or as $141^\circ 11' 55$ to 1000000 ; and therefore it is $55^\circ 44' 8''$, and consequently the angle of the rhombus of the best form is that of $109^\circ 28' 16''$.

By this solution it is easy to estimate what saving is obtained by means of this construction.

If the base were flat, and not of the pyramidal form above described, then, besides completing the parallelograms CGNK and BMNK, the surface of the base itself would be $3CBKAK$; what they really do form amounts in surface to the same parallelograms, and $3CB \times AH$; the savings therefore amount to $3CB \times AK - AH = 3CB \times AH \times \frac{\sqrt{3}-\sqrt{2}}{\sqrt{3}}$, which is almost a fourth part of the pains and expence of wax they bestow above what was necessary for completing the parallelogram sides of the cells.

Mr. Maclaurin has also demonstrated, that the plane angles CLB, CLN, and BLN, which form the solid angle at L, or the apex at L, are equal to each other; from which it is obvious, that the four acute, plane angles, which form the solid angle at C or B, are likewise mutually equal. It may be also added, that if the cells had been of any other form than hexagonal, and the bases had still been pyramidal, these must have been terminated by trapezia, and not by rhombuses, and therefore they would have been less regular, because OA and AK would have been unequal. Nor could there have been room for such an advantageous or frugal construction

as that we have described, because the solid content of the cell would have increased with the right line KE. See Phil. Trans. abt. vol. ix. p. 2, &c.

This construction not only occasions a very great saving of the wax or matter of the comb; but besides this, there is another great advantage, which is, that the angles, resulting from this construction of the bases, greatly strengthen the whole work.

The matter of which the comb is made, costs the bees so much pains and labour in collecting, that it is no wonder they are careful and sparing of it in the work. The sides of the cells are all much thinner than the finest paper, and yet they are so strengthened by their disposition, that they are able to resist all the motions of the bee when within them, as they are very frequently obliged to be. The effect of their thrusting their bodies into the cells, would be the bursting of those cells: at the top, were not this well guarded against. But to prevent this, the creatures extend a cord or roll of wax round the verge of every cell, in such a manner, that it is scarce possible they should split in that particular part. This cord or roll is at least three times as thick as the sides of the cells, and is even much thicker and stronger at the angles of the cells than elsewhere; so that the aperture of each cell is not regularly hexagonal, though its inner cavity be perfectly so.

The bases of the cells are not always perfectly triliteral; sometimes, instead of the three rhombs they should be composed of, they consist of four pieces, the bee having begun her work wrong; but then it is admirable to observe how nicely the two smaller pieces are afterwards joined, that the angle they make may be as nearly as possible equal to that of one of the rhombs, so that the base of the cell still remains very nearly triliteral.

It would be a most desirable thing to see the bees at work in their making these elegant and regular fabrics; but it is scarce possible to see any thing of this kind distinctly, even with the advantage of glass hives; for no bee ever works singly on this occasion, but wherever the fabric is erecting, there are numbers together, all trying to assist one another; and their motions are so swift, and so hid by their standing before one another, that very little is to be seen of them. New bees are every moment coming to the place, and old ones going away; and very frequently those which arrive late are dispatched away immediately after they arrive. There are only some very short moments in which the glances of the hives can give a view of the creatures regularly employed in their work, for the moment that one sees a bee at work in building, that moment we see one either fly off, or some other bee get before her, so as to hinder the view.

These momentary sights, however, are sufficient to make it plain, that the bee uses her teeth in modelling and fashioning the wax. The side of a cell is always received between the two teeth on this occasion, and by means of repeated blows on each side from each tooth, the side is brought to a proper thickness, and the wax is by the same means wrought up to a proper consistence and firmness.

The celerity with which a swarm of bees received into a hive, where they find themselves lodged to their minds, bring their works of the comb to perfection, is amazing. In a week's time, when the weather favours, the half or two thirds of a hive will be filled with combs. There are vast numbers at work all at once, and that they may not encumber one another, they do not work upon the first comb till it is finished; but when the foundation of that is laid, they go to work upon another; so that there are often the beginning of three or four stories made at once; and so many swarms allotted to the carrying on the work of each.

The several combs are all placed parallel one to another, and hang perpendicularly from the top of the hive to the bottom: they begin each comb at the top or upper part of the hive, and carry it down to the floor, from side to side; and there is such a space left between them, that the bees can easily pass between them: there are also holes made through the substance of the several combs, by which they pass from the space that lies between one pair of combs and another. They often place a part of the comb in a contrary direction to the rest; so that while the others are placed horizontally, these stand perpendicularly: these are also several other directions, in which they are disposed, which are easily accounted for from the nature of the place, and are always found to be the very best that could be used for the occasion.

Though the sides of all the cells are extremely thin, yet the combs are very heavy when full of bees. This might endanger their breaking their hold, if only sustained from the top; and for this reason the bees give them several additional supports in whatever places they can, often fastening them in many places one to another, and often

fastening them to the sides of the edifice by large and solid lumps of wax.

It has generally been supposed that every bee of a swarm has its particular cell in some comb which was its own, and contained honey for its peculiar food; but the use of the glass hives has shewn us that all the cells are used in common. Reaumur, Hist. Inf. vol. ix. p. 282. vol. x. p. 21, &c.

HONEY-COMB, in Gunpow, is a flaw in the metal of a piece of ordnance, when it is ill cast and spongy.

HONEY-CORAL, in Natural History, the name given by many authors to a species of fossil coral, which is usually found in large masses, and those full of large hexagonal cells, resembling those of a honey-comb. These are but slightly striated, and usually run deep into the stone.

HONEY-DEW is a sweet tailed dew, found early in the morning on the leaves of divers sorts of plants.

HONEY-DEW is of a very different nature from blasting, being caused by the condensing of a fat moist exhalation, raised, in a hot dry summer, from plants and blossoms; as also from the earth, which, by the coolness and serenity of the air in the night, or in the upper clear region of the air, is thickened into a fat plume matter, and then falls to the earth again; part whereof rests upon oak-leaves, and those of some other trees, whose leaves are smooth, and do not easily admit the moisture into them. Galls also, holds that a viscous juice, transpiring out of the leaves, helps to complete this dew; or to convert the dew, falling on them, into a honey substance, which before had nothing of it; hence be accounts for the reason why we find it on some trees and not on others.

This honey-dew, falling on the ears and stalks of wheat, besetters them with a different colour from the natural; and, being of a clammy substance, so binds up the young, tender, and close ear of the wheat, by the heat of the sun, that it prevents the growth and completing of the perfect grain therein.

Hops, when in flower, are subject to the disemper called the *honey-dew*, which appears in the form of a meal, and is found by the microscope to contain the eggs of small insects, which fly about in swarms near the time when the hop is in flower, and gnaw the leaves and shoots. Several methods have been proposed for preventing the damage arising from this dew, particularly by surrounding the hop-hills with hot dung, or casting wood-ashes to be scattered with the wind over the hops at the time when the mealy dew falls. But the most effectual way of preventing its ill effects is to strip off the leaves, whereby the small insects contained in it perish at once, and before fresh leaves spring forth, their season of breeding is past.

A shower of rain, succeeding presently after the fall thereof, or the wind blowing bluster, are the only natural remedies against it. See DRY, MILDEW, and PERISPORIA OF PLANTS.

HONEY-FLOWER, *in Botany*, a genus of the *diandria monophylla* class. Its characters are these: the flower hath four narrow spear-shaped petals, divided into two lips, connected to their sides; and a nectarium of one leaf, situated in the lower segment of the empanment, and fastened with it to the receptacle: it hath four erect stamens, the two under being somewhat shorter than the other; in the centre is situated a four-cornered germ, which afterwards becomes a quadrangular capsule with distended cells divided by partitions in the centre, each containing one almost globular seed. There are two species, natives of the Cape of Good Hope. Miller.

HONEY-GUIDE, in Ornithology. See *Coccyzus indicus*.

HONEY-VIOLET, or *three-lobed violet*, in Botany, *gladiosa*, a genus of the *polygamia aëria* class. Its characters are these: it hath male and hermaphrodite flowers on the same plant, and female flowers in different plants; the male have a three-leaved empanment and three roundish petals, with a tubulated nectarium; they have six stamens terminated by compressed summits; the hermaphrodite flowers have quadrifid empanments, with four petals and six stamens; and have a germ, style, and pod, like the female, which are situated in different trees; those have a five-leaved empanment and five petals, with two nectariums, and a broad germ longer than the pod; the latter becomes a large flat pod, with four longitudinal partitions, having a pulp in each division, surrounding one hard roundish seed. There are two species, natives of North America. Miller.

HONEY-SUCKLE, in Botany, *periclymenum*, Town. Inf. R. H. 608. tab. 528. Its characters are these: the empanment of the flower is cut into five parts, sitting upon the germ; the flower is of one petal, having an oblong tube, cut at the top into five segments, which turn backward; it has five awl-shaped stamens, almost the length of the petals, and a roundish germ situated be-

low the flower, which becomes an umbellated berry with two cells, each containing one roundish seed. Miller enumerates eight species. Linnaeus has joined the perilymenum to the losicera. See the next article.

The propagation of all the several sorts of *honeysuckle* is by laying down their young shoots in autumn, which, if they are supplied with water, will by the autumn following have taken root so well, as to be fit to remove. They should at this time be transplanted into nurseries, beds for a year or two, the better to train them up, either for headed plants or for creepers, to plant against trees, walls, &c.

They may also be propagated by planting cuttings in September; the cuttings should have four joints, three of which should be buried in the ground, and they should be planted in rows, at the distance of about a foot, four inches asunder in the rows, treading the earth close to them. In order to preserve them from the wind and frost, the ground between the rows should be covered with tanner's bark or dung. The plants raised from cuttings are preferable to those propagated by layers, having generally better roots. Their twined and long continuance in flower make them of great value in small quarters. Among flowering shrubs they are also very beautiful, when planted against the stems of old trees, where, if they are not too much shaded, they will flourish exceedingly.

The proper season for cutting them, to keep them in a regular form, is about Michaelmas, soon after they have done flowering. This is to be done with a knife, observing always to cut behind a leaf-bud; for how much sooner the shoot is left longer, it will always die down to that part. They are most of them very hardy.

The Virginian scarlet *honeysuckle*, called the trumpet *honeysuckle*, is a very beautiful flowering kind, and in great esteem. It is propagated by laying down the young branches, which will easily take root, and may be afterwards treated like the *honeysuckle*. They should be planted in a strong soil, and exposed to the south-east sun; but they must have a wall or pale behind them to support the branches, otherwise they will trail upon the ground. It is a native of Virginia, but will thrive very well with us, bearing all the cold of our winters. These plants begin to flower the latter end of June, and there will be a succession of flowers till the autumn. Miller.

The leaves of the *honeysuckle*, which are the only parts used, are sometimes put into gargles for sore throats, though others affirm them not to be proper for that purpose, because of their great heat. Some commend a decoction of them for a cough and asthma, and to open obstructions of the liver and spleen. The oil made by infusion of the flowers, is accounted healing and warming, and good for the cramp and convulsions of the vertebra. Miller's Bot. Off.

HONEYJACK, upright, or dwarf cherry, hawthorn, in history, a genus of the *penstemon* class. Its characters are: the flower hath a small calicement, cut into five parts, upon which the germin sits; it hath one petal, with an oblong tube, cut into five parts at the brim, and five awl-shaped stamens; under the petal is situated a roundish germin, supporting a slender style; the germin becomes a berry with two cells joined at their base, and polypermous. Miller enumerates seven species. To this genus Linnaeus has joined the *caprifolium perilymenum*, and *agilium* of Tournefort, and the *symplocarpos* of Dillenius.

These plants may be propagated either by seeds or cuttings. The seeds commonly lie in the ground for a year before they vegetate, but require no particular culture. If they are sown in autumn, many of them will grow the following spring. The cuttings should be planted in autumn, in a shady border, and in the following autumn may be removed into a nursery, whence, after two years, they may be transplanted into the ground where they are to remain. They are commonly intermixed with other flowering shrubs for the sake of variety, but there is little beauty in their flowers. They are hardy plants, and will thrive in a cold situation, and love a light moist soil. Miller. See SYMPLOCARPOS.

HONEYJACK, African fl. See HALLERIA.

HONEYJACK, American species. See AKEBA.

HONEYJACK, French, hollyhock, in history, a genus of the *diadelphus diadelphus* class. Its characters are: the flower has a permanent calicement of one leaf, cut into five segments at the top; it is of the battery-kind, the wings oblong and narrow, the keel compressed and convex at the base; it has nine stamens joined, and one standing separate, which are reflexed in the center is situated a long narrow germin, which afterward becomes a joined compressed pod, each joint being roundish, and inclosed a single kidney-shaped seed. Miller enumerates nineteen species, natives of water-courses; but Linnaeus reckons fifty.

The **ALHAGI** of the Moors is a species of this genus. From this shrub the Persian manna is collected, which is an exudation of the nutritious juice of this plant. This drug is chiefly gathered about Iauris, a town in Persia, where the shrub abounds.

This plant is reckoned deobstruent and vulnerary. James.

HONEYJACK, trumpet. See HONEYJACK, SUPRA.

HONEYJACK, graft. See TREBELL.

HONEYJACK, dentate, in history, a genus of the *penstemon* class. Its characters are: the flower has one petal, with a thick short tube, and at the brim is quincuncial, and has five short stamens in the bottom are situated four germina, two of which afterward become so many seeds, which are hard, smooth, plain in one side, but convex on the other, and are inclosed in the embelement. Miller enumerates five species, but Linnaeus only two.

HONI *fit qui mal y perse, q. d. vult se hinc thandi rest;* the motto of the most noble order of the knights of the Garter. See GARTER and MORTUO.

HONOR. See HONORUS.

HONORABLE. See HONORABLE.

HONORARY. See HONORARY.

HONORIACI, in *antiquity*, a species or order of soldiery under the eastern empire, who introduced the Goths, Vandals, Alani, Suevi, &c. into Spain. Dismus and Verinianus, two brothers, had, with great vigilance and valour, defended the passages of the Pyreneans against the Barbarians for some time, at their own expence; but being at length killed, the emperor Constantius appointed the *honorarii* to defend those passages, who, not contented to lay them open to all the nations of the North then ravaging the Gauls, joined themselves to them.

HONOUR, among the *Ancients*, was worshipped as a divinity, and had a temple erected to it, which had no entry but through the temple of Virtue.

Honour is represented on many medals, under the figure of a man holding a pike, and sometimes an olive-branch, in the right-hand, and a cornucopia in the other.

Beside its literal sense, wherein it denotes a testimony or token of esteem and admiration, *honour* is particularly applied in our customs to the more noble kind of feignments or lordships, whereas other inferior lordships or manors hold or depend.

As a manner consists of several tenements, services, customs, &c. so an *honour* contains divers manors, knight-fiefs, &c.

It was also formerly called *honorificum* or *regni fides*, being always held of the king in capite. See *capite*.

Anciently, *honour* signified the same as *harmis*.

HONOUR, confidors of, or Honorary Confidors, are such as have a right to enter or sit in assemblies, courts, &c. to deliberate or give judgment in the same, though they do not regularly and properly belong thereto.

The French call *chevaliers* of *HONOUR*, *knights or gentlemen of honour*, the gentlemen-ushers of queens and princesses, who attend them, give them their hand, &c. See *USHER*.

HONOUR, maids of, are young ladies in the queen's household, whose office is to attend the queen when she goes abroad, &c. In England they are six in number, and their salary 300*l.* per annum each.

HONOUR, pages of, are officers both of the king's and queen's household, under the master of the horse. Of the former there are four, whose annual salary is 200*l.* each; and of the latter two, with a salary of 150*l.* each.

HONOURS of the Louvre, among the *French*, are certain privileges annexed to divers dignities or offices, particularly those of dukes, peers, chancellor, &c. as to enter the Louvre in a coach, to have the labourer or stool in the queen's presence, &c.

HONOURS of the hosts are certain ceremonies observed in receiving visits, making entertainments, &c. performed either by the master himself, or by some person appointed for that purpose, as to go and receive the guests, to conduct them out again, to see they be well seated, and, in short, to perform all the civilities and ceremonials of polite hospitality.

HONOURS of the city are the public offices or employments thereof. He who has been constable, overseer of the poor, and churchwarden at his parish; common-councilman, alderman, and lastly mayor; has passed all the *honours* of the city.

HONOURS of the church are the rights belonging to the patron, &c. as a seat and sepulchre in the church, to be first served with the consecrated bread and wine, &c.

HONOURS are also applied to the principal part of the apparatus of great ceremonies; as coronations, consecrations, christenings, &c. Such are the oil, tapers, &c. In obsequies they anciently represented the *honours*, that is, the shield, crest, sword, gantlets, spurs, banner, hoofs, &c.

HONOURS,

HONOURS, funeral, are the ceremonies performed at the interment of great men; as hangings, hearers, funeral harangues, &c.

HONOUR courts are held within the *barons* or *leignories* above mentioned.

HONOUR point, in *heraldry*, is that next above the center of the escutcheon, dividing the upper part into two equal portions. See *POINT* and *ESCUTCHION*.

HONOURABLE amends, amends honourable. See *AMENDS*.

HONOURABLE, or HONORABLE ordinaries, in *heraldry*. See *ORDINARY*.

HONOURARY, or HONORARY, is understood of a person who bears or possesses some quality or title, only for the name's sake, without doing any of the functions thereof belonging to, or receiving any of the advantages thereof.

Thus we say, *honorary* counsellors. See *Counsellors of Honour*.

In the college of physicians, London, are *honorary* fellows. The royal academy of sciences at Paris consists of four classes of members, viz. *honorary*, pensionary, associates, and adjuncts. See *ACADEMY*.

HONOURARY games. See *GAMES*.

HONOURARY services are those incident to the tenure of grand feoffment, and commonly annexed to *honours*.

HONOURARY tutor is a person of quality appointed to have an eye over the administration of the affairs of a minor, while the ordinary tutors have the real effective management thereof.

HONOURARY, HONORARIUM, is also used substantively for a lawyer's fee, or a salary given to public professors of any art or science.

HONTONGENTHEF, a thief taken *hond-habend*, i. e. having the thing stolen in hand.

HOOD. See *CHAPERON* and *COQUELUS*.

HOOD, in *Falconry*, is a piece of leather, wherewith the head of a hawk, falcon, or the like, is covered.

After feeding or sewing up the eyelids of a young hawk, the is to be fitted with a large easy hood, which is to be taken off and put on every often, watching her two nights, and handling her frequently and gently about the head. When you perceive the has no aversion to the hood, unfasten her in the evening by candle-light, continuing to handle, feed, and unhood her, as before, till at last she takes no offence, but will patiently endure handling. After unfastening, anoint with the finger and spittle the place where the feeding thread was drawn through; then hood her, and hold her on your fist.

As soon as the is well reclaimed, let her sit upon a perch; but every night keep her on the fist three or four hours, stroking, handling, and unhooding, &c. And thus you may do in the day-time, when the hath learnt to feed eagerly and without fear.

HOOD, on *Shedward*, is a copper frame, made to go on the top of the chimney, and to shift as the wind does, that the smoke may always fly to leeward.

HOOD is also a sort of low wooden porch, placed over the stair-case or ladder, which leads into the storeroom or apartments, where the crew generally reside in a merchant-ship. The use of the hood is to admit air and light, and at the same time to prevent the rain from falling into the storeroom. The wooden porch over the entrance or stair-case of the master's cabin is called *companion*.

HOOF, ungula, the horny part which covers the feet of divers animals, as horses, bullocks, &c.

The hoof serves much the same purposes as the nails of some animals, and the claws of others.

The hoof of a horse surrounds the sole and the coffin-bone. To be good, it should be of a dark colour, somewhat shining, high, smooth, of a round shape, but a little larger below than above; short, that the horse may tread more on the toe than on the heel; and somewhat hollow within, having a narrow frith and broad heels.

The hoof should not have circles, which are a sign of its being brittle, and that the horse, having been often shod, has had his feet spoiled by the many pieces broke out of it. A white hoof also is commonly brittle.

To judge whether the hoof be good and staunch, lift up the foot, and consider if it have a shoe forged purposely for it, and be very much pierced, and the holes made in the unusual parts, as wanting horn enough to take hold by in those places where the nails are commonly driven. Sometimes they are forced to pierce the shoes nigh the heels, because the fore-part is bad; it being unusual to drive the nails near the heels, except the toe be so much split and broke as not to bear nails.

If the hoof be not round, but broad, and spreading out at the sides and quarters, the horse commonly has narrow heels, and, in time, will be flat-footed; which sort of foot is weak, and will not carry a shoe, nor travel far, but farbare; add, that treading more on his heels than his toes, will cause him to go low on his pasterns.

If the hoof be long, it will make him tread altogether on his heels. If crooked, viz. broad without and narrow within, so that the horse is spay-footed, it will cause him to tread too much inward, and cur or interfere. If the frith be broad, the heels will be weak and soft. If the heel be narrow and tender, the horse will in time grow hoof-bound.

HOOF, horn, is a round bony swelling, growing on the top of a horse's hoof, which is always caused by some blow or bruise. This is first to be ripened and brought to suppuration by digesting it with rotten litter, or hay boiled in stale urine, or with a plaster of stale wine-lees and wheat-flour boiled together. When it is come to a head, let it be lanced with a thin hot iron, and put a vent into it made of turpentine, deer's fat, and wax, boiled together in equal quantities, and lay a plaster of the same over the tent.

HOOF, brith, the name of an infirmity to which horses are subject. It comes sometimes naturally, and sometimes artificially. When it comes naturally, it is generally hereditary, the sire or dam having had the same complaint. When it comes on accidentally, it is sometimes owing to a dislimber falling down into the feet; sometimes to the creature's being much foundered.

The hoof, in this discomper, is so friable and rotten, as it were, that it cracks and flakes off on every slight occasion. The cure is to be attempted in this manner: take wax, turpentine, suet, and hog's lard, of each four ounces; salad oil, a quarter of a pint by measure; and of dog's grease, half a pound: let the whole be melted together, and strained through a piece of canvas into a gallypot. The hoof is to be thoroughly anointed with this every day, morning and evening, especially at the root; and if there are any large cracks, they must be filled up at every dressing with a mixture of equal parts of cow-dung and hog's lard.

The other infirmities to which hoofs are liable, are, the swelling of the hoof, hoof-bound, hoof-hard, hoof-hurt, loose hoof, false quarters, &c.

HOOF, caving of the. A horse is said to *cast his hoof*, when the whole coffin of the hoof becomes loosened, and falls off from the bone. This may be remedied by care, and proper application; a new hoof being procurable, if the coffin bone, &c. be not hurt.

Horses sometimes cast their hoofs, by reason of some prick, stub, foundering, lurching, or other accident, that causes an impotumation in the foot; so that the hoof, and sometimes the coffin-bone, being spongy and easily broken, fall off in large pieces. The last, when it happens, is a desperate case.

HOOF-bound, is a swelling in of a horse's hoof on the top and at the heel, which makes the hoof flare above the hoof, and grow over the same.

It befalls a horse divers ways, either by keeping him too dry in the stable, by strait shoeing, or by some unnatural heat after foundering.

HOOF-hurt. In labouring beasts, especially oxen, if the hoof be hurt with a souler or shoe, it may be cured by a salve of pitch and grease mixed with powder of brimstone, dissolved together, and with a hot iron melted in the clefts of the hoof.

HOOF-loosened, is a dissolution or dividing of the horn or coffin of a horse's hoof from the flesh, at the setting on of the coronet.

If the parting be round about the coronet, it comes by means of foundering; if in part, then by a prick of some chanel-nail, quarter-bone, retreat, graveling, cloying, or the like. The signs of being loosened by foundering, is its breaking first in the fore-part of the coronet, right against the toes; because the humour always defends towards the top. If it proceeds from picking, graveling, or the like, the hoof will loosen round about equally, even at first. If occasioned by a quarter-bone, or hurt on the coronet, it will break right above the grieved part, and rarely be seen to go any farther.

HOOF-swell, is an infirmity that sometimes befalls young horses, when they are over-rid or wrought hard, which makes them swell in that part, because of the blood falling down and settling there; which, if not speedily removed, will usually beget a wet-spavin.

For the cure, take the strongest aqua fortis, and first file or draw away the old hoof to a considerable degree with a file or drawing iron; then touch what is left of the hoof for three or four dressings with the aqua fortis; anoint the foot with an ointment made of one pound of hog's grease, three quarters of a pound of pitch grease, five ounces of Venice turpentine, three ounces of new wax, and three ounces of salad oil, melted together over the fire; and thus a new hoof will be made to grow on the foot.

HOOK, in *Angling*, &c. See *FISHING-hook*.

HOOKS, in *Building*, &c. are of various sorts; some of iron,

iron, and others of brass, viz. 1. *Armour-hoof*, which are generally of brass, and are to lay up arms upon, as guns, muskets, half-pikes, pikes, jetties, &c. 2. *Clothes-hoof*, 3. *Chimney-hoof*, which are made both of brass and iron, and of different fashions: their use is to set the tongs and fire-shovel against. 4. *Curtain-hoof*, 5. *Hoof for doors, gates, &c.* 6. *Double iron-hoof*, large and small. 7. *Single iron-hoof*, large and small. 8. *Trivet-hoof*, of various sorts. See *TAVERN*.

HOOKS of a ship, are all those forked timbers which are placed directly upon the keel, as well in her run as in her rake. See *HEAVY-BUILD*.

HOOK, fast, in a Ship, See *BOAT*.

HOOKS, can, those which being made fast to the end of a rope, with a noose (like that which brewers use to sing or carry their barrels on), are made use of for lingers.

HOOKS, fast, in a Ship, the same with *PUTLOCKS*.

HOOK-land, or DRY-land, land ploughed and sowed every year. *DICTIONARY*.

HOOK, fast, in a Ship, a tackle with two hooks, one to hitch into a cringle of the main or fore-fall, in the bolyard at the leech of the tail by the clew; and the other is to hitch into a flang, which is spliced to the sheaf-tree. Their use is to pull down the fall, and secure the tackles in a large fall and fling gale, that all the stress may not bear upon the tackle. It is also used when the tack is to be seized more secure, and to take off or put on a bonnet or drabber.

HOOK-pin, in Architecture, are taper iron pins, with a hook-head, to pin the frame of a roof or floor together.

HOOKS, fast, in a Ship, those hooks like tickles fixed in the ends of the yard-arms, that if a ship under full come to board her, those *hooks* may cut her shrouds, and so spoil her tackling. But as those *hooks* are subject to break their own yards, and cut the ropes that come from the top-falls, they are now very seldom used.

HOOKS, trail. See *TRAIL-HOOKS*.

HOOKS, draught. See *DEAUGHT-HOOKS*.

HOOKER, is the name of a vessel built like a pink, but rigged and manœuvred like a hoy; much used by the Dutch. *HOOPER*. See *DETENT-HOOPER*.

HOOPER, in Ornithology, a name by which several have called the cygnus ferus, or wild SWAN.

HOOPERING cough, in Medicine. See *CHIN-COUGH*.

HOOPER, Linnaeus, in the Linnaean system of *Ornithology*, makes a distinct genus of birds of the order of *psittaci*, the characters of which are, that the beak is bent, convex, falciform, and in a small degree obtuse; the upper is obtuse, triangular, and very short; and the feet are ambulatory. Under this genus Linnaeus has classed three species, the *apops apops*, the *promops*, and bird of PARADISE.

The *hopper*, or *hoppe hoppe*, is found in many parts of Europe, in Egypt, and even as remote as Ceylon. It frequently visits our islands, but not at stated seasons, and never breeds with us. In Sweden it is vulgarly considered as a forerunner of some calamity. Its general weight is about three ounces; the beak is black, slender, sharp, and a little hooked; its head is adorned with an extremely beautiful and elegant crest, rising two fingers high, and composed of two series of feathers, reaching from the inferior of the back to the back part of the head, which it raises and depresses at pleasure. The tips of these feathers are ornamented with black and white; the rest is of a chestnut colour; its neck is of a pale reddish brown; its breast and belly white, variegated with longitudinal streaks, which disappear in the middle, as the bird grows older; the tails black, and composed of ten feathers, but has a large spot in it, in form of a crescent, the horns pointing towards the extremity of the tail; the legs are short and black. Its wings, when folded, do not reach to the end of the tail, and are streaked across with white; it feeds on beetles, worms, ants, &c. and is said also to eat berries, and other vegetables. It breeds in hollow trees, and lays two silken-coloured eggs. According to Linnaeus it takes its name from its note, which has a sound similar to the word; or it may be derived from the French *hoppe*, *cried*. Ray and Pennant. See *Talk. H. Birds*, N° 22.

HOP, *Lupulus*, or *Humulus*, in Botany, a genus of the *dicotyledonous* class. Its characters are these: It has male and female flowers upon different plants; the empanment of the male flower is composed of five small concave oblong lobes; it has no petal, but five short, hairy stamens; the female flowers have a general, four-pointed, acute perianthium, and a separate oval one of four leaves, including eight flowers; each of these have an empanment of one leaf, closed at the base; these have neither petal nor stamens, but a small germen, situated in the centre, supporting two awl-shaped styles, which turn to a roundish seed, covered with a thin skin.

Vol. II. N° 174.

enclosed in the base of the empanment. We have but one species of this genus, which is distinguished into the male and female *hop*.

The male *hop* grows wild by the sides of hedges and open banks, in many parts of England. The young shoots of these plants are often gathered by the poor people, and boiled as an excellent herb; but these must be taken very young, otherwise they are tough and stringy. This is easily distinguished by the flowers, which are small and hang in long loose bunches from the side of the stalks, abounding with farina on their feminis, and have no legs succeeding to the flowers.

The female *hop* is that sort which is cultivated for use; of this sort, the people who cultivate them reckon three different varieties: 1. *fast*, the long and square garlic *hop*, the long white *hop*, and the oval *hop*, all which are indifferently cultivated in England.

There being the greatest plantations of *hops* in Kent of any county in England, it is very probable that their method of planting and ordering them should be the best.

Hops were first brought into England from the Netherlands in the year 1524. They are first mentioned in the English statute book in the year 1553, viz. in the fifth and sixth of Edw. VI. cap. 5. and by an act of parliament of the first year of king James I. anno 1603, cap. 15. it appears, that *hops* were then produced in abundance in England.

The *hop* being a plant of great importance in the article of brewing, we shall consider what relates to the culture and management of it under the following heads.

Hops, the soil proper for. As for the choice of their *hop-grounds*, they choose the richest and thorough grounds as the most proper; and if it be rocky within two or three feet of the surface, the *hops* will prosper well; but they will by no means thrive on a stiff clay, or spongy wet land.

The Kentish planters account new land best for *hops*; they plant their *hop-grounds* with apple trees at a large distance, and with cherry trees between; and when the land hath done its best for *hops*, which they reckon it will in about ten years, the trees may begin to bear. The cherry trees last about thirty years, and by this time the apple trees are large, they cut down the cherry trees.

The Essex planters account a moory land the most proper for *hops*.

As to the situation of a *hop-ground*, one that inclines to the south or west is the most eligible; but if it be exposed to the north-east or south-west winds, there should be a shelter of some trees at a distance, because the north-east winds are apt to nip the tender shoots in the spring, and the south-west winds frequently break and blow down the poles at the latter end of the summer, and very much endanger the *hops*.

In the winter time provide your soil and manure for the *hop-ground* against the following spring.

If the dung be rotten, mix it with two or three parts of common earth, and let it incorporate together till you have occasion to make use of it in making your *hop-plant*; but if it be new dung, then let it be mixed as before, till the spring in the next year, for new dung is very injurious to *hops*.

Dung of all sorts was formerly more commonly made use of than it is now, especially when rotted, and turned to mould, and they who have on other measure must use it; which, if they do, cows or horse-dung, or human excrement mixed with mud may be a proper compost, because *hops* delight most in a manure that is cool and moist.

Hops, the planting of. *Hops* require to be planted in a situation so open, as that the air may freely pass round and between them, to dry up and dissipate the moisture, whereby they will not be so subject to *STREW-WAST*, which often destroy the middles of large plantations, while the outfiles remain unharmed.

As for the preparation of the ground for planting, it should, in the preceding winter, be ploughed and harrowed even; and then lay upon it in heaps a good quantity of fresh rich earth, or well rotted dung and earth mixed together, sufficient to put half a bushel in every hole to plant the *hops* in, unless the natural ground be very fresh and good.

The hills where the *hops* are to be planted, should be eight or nine feet asunder, that the air may freely pass between them; for in close plantations, they are very subject to what the *hop-planters* call the fire-blast.

If the ground is intended to be ploughed with horses between the hills, it will be best to plant them in squares chequerwise; but if the ground is so small, that it may be done with the breast-plough or spade, the holes should be ranged in a quincunx form. Which way soever you make use of, a stake should be stuck down at all the places where the hills are to be made.

Persons ought to be very curious in the choice of the plants,

plants, as to the kind of *hop*; for if the *hop-garden* be planted with a mixture of several sorts of *hops* that ripen at several times, it will cause a great deal of trouble and be a great detriment to the owner.

The two best sorts are the white and the grey bind; the latter is a large square *hop*, more hardy, and is the more plentiful bearer, and ripens later than the former.

There is also another sort of the white bind, which ripens a week or ten days before the common; but this is tenderer and a less plentiful bearer; but it has this advantage, that it comes first to market.

But if three grounds, or three distant parts of one ground, be planted with these three sorts, there will be this convenience, that they may be picked successively as they become ripe. The sets should be five or six inches long, with three or more joints or buds on them.

If there be a sort of *hop* you value, and would increase plants and sets from, the superfluous binds may be laid down when the *hops* are cut, cutting off the tops, and burying them in the hill; or when the *hops* are dressed, all the cuttings may be saved, for almost every part will grow, and become a good set the next spring.

As to the seasons of planting *hops*, the Kentish planters best approve the months of October and March, both which sometimes succeed very well; but the sets are not to be had in October, unless from those ground that is to be destroyed; and likewise there is some danger that the sets may be rotted, if the winter prove very wet; therefore the best time of procuring them is in March, when the *hops* are cut and dried.

As to the manner of planting the sets, there should be five good sets planted in every hill, one in the middle, and the rest round about sloping, the tops meeting at the centre; they must stand even with the surface of the ground, let them be pressed close with the hand, and covered with fine earth, and a stick should be placed on each side of the hill to secure it.

The ground being thus planted, all that is to be done more during that summer, is to keep the hills clear from weeds, and to dig up the ground about the month of May, and to raise a small hill round about the plants. In June you must twist the young binds or branches together into a bunch or knot; for if they are tied up to small poles the first year, in order to have a few *hops* from them, it will not countervail the weakening of the plants.

A mixture of compost or dung being prepared for your *hop-ground*, the best time for laying it on, if the weather prove dry, is about Michaelmas; that the wheels of the dungcart may not injure the *hops*, nor furrow the ground; if this be not done then, you must be obliged to wait till the frost has hardened the ground, so as to bear the dungcart; and this is also the time to carry on your new poles, to recruit those that are decayed, and to be cut out every year.

If you have good store of dung, the best way will be to spread it in the alleys all over the ground, and to dig it in the winter following. The quantity they will require will be forty loads to an acre, reckoning about thirty bushels to the load.

If you have not dung enough to cover all the ground in one year, you may lay it on one part one year, and on the rest in another, or a third; for there is no occasion to dung the ground after this manner oftener than once in three years.

Those who have but a small quantity of dung, usually content themselves with laying on about twenty loads upon an acre every year; this they lay only on the hills, either about November, or in the spring, which last some account the best time, when the *hops* are dressed, to cover them after they are cut; but if it be done at this time, the compost or dung ought to be very well rotted and fine.

Hops, the dressing of. As to the dressing of the *hops*, when the *hop-ground* is dug in January or February, the earth about the hills and very near them, ought to be taken away with a spade, that you may come the more conveniently to the flock to cut it.

About the end of February, if the *hops* were planted the spring before, or if the ground be weak, they ought to be dressed in dry weather; but else, if the ground be strong and in perfection, the middle of March will be a good time; and the latter end of March, if it be apt to produce over-rank binds, or the beginning of April may be soon enough.

Then having with an iron picker cleared away all the earth on of the hills, to as to clear the flock from the principal roots, with a sharp knife you must cut off all the shoots which grew up with the binds the last year and also all the young suckers, then none be left to run in the alleys, and weaken the hill. It will be proper to cut one part of the flock lower than the other, and also to cut

that part low that was left highest the preceding year. By pursuing this method, you may expect to have stronger buds, and also keep the hill in good order.

In dressing those *hops* that have been planted the year before, you ought to cut off both the dead tops, and the young suckers, which have sprung up from the sets, and also to cover the flocks with fine earth a finger's length in thickness.

Hops, the tying of. About the middle of April the *hops* are to be poled, when the shoots begin to sprout up; the poles must be set to the hill deep into the ground, with a square iron picker or crow, that they may the better endure the winter; three poles are sufficient for one hill. These should be placed as near the hills as may be, with their bending tops turned outwards from the sets, to prevent the binds from entangling; and a space between two poles ought to be left open to the south, to admit the sun-beams.

The poles ought to be in length sixteen or twenty feet, more or less, according as the ground is in strength; and great care is to be taken not to overtop a young or weak ground, for that will draw the flock too much, and weaken it. If a ground be overtopped, you are not to expect a good crop from it, for the branches, which bear the *hops*, will grow very little, till the binds have over-reached the poles, which they cannot do when the poles are too long. Two small poles are sufficient for a ground that is young.

If you want till the sprouts or young binds are grown to the length of a foot, you will be able to make a better judgement, where to place the largest poles; but if you lay till they are as long as to fall into the alleys, it will be injurious to them, because they will entangle one with another, and will not clasp about the pole readily. Maple or aspen poles are accounted the best for *hops*, on which they are thought to prosper best, because of their warmth; or else, because the climbing of the *hop* is promoted by means of the roughness of the bark. But for durability, alder or willow poles are preferable; but chestnut poles are the most durable of all.

If after the *hops* are grown up, you find any of them have been under poled, taller poles may be placed near those that are too short, to receive the binds from them.

Hops, the tying of. At to the tying of *hops*, the buds that do not clasp of themselves to the nearest pole when they are grown to three or four feet high, must be guided to it by the hand, turning them to the sun, whose course they will always follow. They must be bound with withered rushes, but not in close as to hinder them from climbing up the pole.

This you must continue to do till all the poles are furnished with binds, of which two or three are enough for a pole; and all the spires and binds that you have no occasion for, are to be picked up; but if the ground be young, then none of these useless binds should be picked up, but should be wrapt up together in the middle of the hill.

When the binds are grown beyond the reach of your hands, if they forsake the poles, you should make use of a stand-ladder in tying them up.

Towards the latter end of May, when you have made an end of tying them, the ground must have the summer dressing, this is done by casting up with the spade some fine earth into every hill; and a month after this is done, you must hoe the alleys with a Dutch hoe, and make the hills up to a convenient bigness.

Hops, the gathering of. About the middle of July *hops* begin to blow, and will be ready to gather about Bartholomew-tide. A judgment may be made of their ripeness by their living scent, their hardness, and the brownish colour of their leaf.

When by these tokens they appear to be ripe, they must be picked with all the expedition possible; for if at this time a storm of wind should come, it would do them great damage, by breaking the branches, and bending and obscuring the *hops*; and it is very well known that *hops*, being picked green and bright, will sell for a third part more than those which are discoloured and brown.

The most convenient way of picking them is into a long square frame of wood, called a bin, with a cloth hanging on tenter-hooks within it, to receive the *hops* as they are picked.

The frame is composed of four pieces of wood joined together, supported by four legs, with a prop at each end to bear up another long piece of wood, placed at a convenient height over the middle of the bin; this serves to lay the poles upon, which are to be picked.

This bin is commonly eight feet long, and three feet broad; two poles may be laid on it at a time, and six or eight persons may work at it, three or four on each side. It will be best to begin to pick the *hops* on the east or north side of your ground, if you can do it conveniently.

HOP

this will prevent the south-west wind from breaking into the garden.

Having made choice of a plot of the ground containing eleven hills square, place the bin upon the hill, which is in the centre, having five hills on each side; and when these hills are picked, remove the bin into another piece of ground of the same extent, and so proceed till the whole *hop-ground* is finished.

When the poles are drawn up to be picked, you must take great care not to cut the blades too near the hills, especially when the *hops* are green, because it will make the sap to flow excessively.

The *hops* must be picked very clean, i. e. free from leaves and stalks; and, as there shall be occasion, two or three times in a day, the bin must be emptied into a *hop-bag* made of coarse linen cloth, and carried immediately to the oak or kiln, in order to be dried; for if they should be long in the bin or bag, they will be apt to heat, and be discoloured.

If the weather be hot, there should no more poles be drawn than can be picked in an hour, and they should be gathered in fair weather, if it can be; and when the *hops* are dry, it will have some expense to firing, and preserve the colour better when they are dried.

The crop of *hops* being thus bestowed, you are to take care of the poles against another year, which are best to be laid up in a shed, having first stripped off the barks from them; but if you have not that convenience, let up three poles in the form of a triangle, or six poles (as you please) wide at bottom, and having set them into the ground, with an iron picker, and bound them together at the top, let the rest of your poles about them, and being thus disposed, none but those on the outside will be subject to the injuries of the weather, for all the inner poles will be kept dry, unless at the top; whereas, if they were on the ground, they would receive more damage in a fortnight than by their standing all the rest of the year.

Hops, drying of. The best method of drying *hops* is with charcoal on an oak or kiln, covered with hair-cloth, of the same form and fashion that is used for drying malt. There is no need to give any particular directions for making these, since every carpenter or bricklayer, in those countries where *hops* grow, or malt is made, knows how to build them.

The kiln ought to be square, and may be of ten, twelve, fourteen, or sixteen feet over at the top, where the *hops* are laid, as your plantation requires, and your room will allow. There ought to be a due proportion between the height and breadth of the kiln, and the height of the fire where the fire is kept, viz. if the kiln be twelve feet square on the top, it ought to be nine feet high from the fire, and the flodder ought to be six feet and a half square, and to be proportionable in other dimensions. The *hops* must be spread even upon the coat a foot thick or more, if the depth of the curb will allow it; but care is to be taken not to overload the said, if the *hops* be green or wet.

The next ought to be first warmed with a fire before the *hops* are laid on, and then an even steady fire must be kept under them; it must not be too fierce at first, lest it scorches the *hops*; nor must it be suffered to sink or slacken, but rather be increased, till the *hops* be nearly dried, lest the moisture or sweat, which the fire has raised, fall back or discolour them. When they have lain about nine hours, they must be turned, and in two or three hours more they may be taken off the said. It may be known when they are well dried, by the brittleness of the stalks, and the easy falling off of the *hop* leaves.

It is found by experience, that the turning of *hops*, though it is after the most easy and best manner, is not only an injury or waste to the *hops*, but also an expense of fuel and time, because they require as much fuel, and as long a time to dry a small quantity, by turning them, as a large one. Now this may be prevented, by having a cover (to be let down and raised at pleasure) to the upper bed whereon the *hops* lie. This cover may also be tinned, by nailing single tin plates over the face of it; so that when the *hops* begin to dry, and are ready to burn, i. e. when the greatest part of their moisture is evaporated, then the cover may be let down within a foot or less of the *hops* (like a reverberatory) which will reflect the heat upon them, so that the top will soon be as dry as the lowermost, and every *hop* be equally dried.

Hops, bagging of. As soon as the *hops* are taken off the kiln, lay them in a room for three weeks or a month to cool, give, and toughen; for if they are bagged immediately, they will powder, but if they lie awhile (and the longer they lie the better, provided they be covered close with blankets to secure them from the air) they may be bagged with more safety, as not being liable to be broken to powder in treading, and this will make them

HOP

bear treading the better, and the harder they are trodden the better they will keep.

The common method of bagging is as follows: they have a hole made in an upper floor, either round or square, large enough to receive a *hop-bag*, which consists of four cloths and a half of ell wide cloth, and also contains ordinarily two hundred and a half of *hops*; they tie a handful of *hops* in each lower corner of the bag, in order to serve as handles to it; and they tatten the mouth of the hole, so placed that the hoop may rest upon the edges of the hole.

Then he that is to tread the *hops* down into the bag, treads the *hops* on every tread, another person continually putting them in as he treads them, till the bag is full, which being well filled and trodden, they unring the fastening of the bag, to the hoops, and let it down, and close up the mouth of the bag, tying up a handful of *hops* in each corner of the mouth, as was done in the lower part.

Hops being thus packed, if they have been well dried, and laid up in a dry place, will keep good several years; but care must be taken, that they be neither destroyed, nor spoiled by the mice making their nests in them. Miller's Gard. Dict.

Hops, disposition of. See FIRE-BLAST, PEN, HONEY-DREW, &c. **Hops, produce of.** The charge of an acre of *hops* and, in most parts of England where *hops* are cultivated, is computed thus: three pounds for the husbandry, four pounds for the wear of the poles, five pounds for picking and drying, one pound ten shillings for dung, one pound for rent, though in some places they pay four or five pounds an acre yearly for the rent of the land, and ten shillings for tithes; in all fifteen pounds a year. The *hop* planters in England reckon, that they have but a moderate return, when the produce of an acre of *hops* does not sell for more than thirty pounds. They frequently have fifty, sixty, eighty, or a hundred pounds; and in a time of general scarcity considerably more; so that upon the whole, if the total charge of an acre of *hops* is computed at fifteen pounds a year, and its average produce at thirty pounds, the clear profit from an acre will be fifteen pounds a year. But the plantation of *hops* has lately so much increased, that the average produce so much exceeded the consumption, that *hops* have been with many planters rather a losing than a very profitable article.

Hops, uses of. In the spring time, when the bud is yet tender, the tops of the plant being cut off, and boiled, are cut like asparagus, and found very wholesome and effectual to loosen the body; the seeds and tendrils are good to purify the blood in the scurvy, and such cutaneous diseases; decoctions of the flowers, and syrups thereof, are of use against pestilential fevers; juleps and apozemes are also prepared with *hops*, for hypochondriacal and hysterical affections, and to promote the menses.

A pillow stuffed with *hops*, and laid under the head, is said to procure sleep in fevers, attended with a delirium. But the principal use of *hops* is in the brewery, for the preservation of malt liquor; which by the superaddition of this balsamic, aperient, and diuretic bitter, become less viscid, less apt to turn sour, more detergent, more disposed to pass off by urine, and in general more salutary. They are said to contain an agreeable odorous principle, which promotes the vinous fermentation. When slightly boiled or infused in warm water, they increase its spirituousity.

Hops, laws relating to. By 9 Anne, cap. 121. an additional duty of 3d. a pound is laid on all *hops* imported, over and above all other duties; and *hops*, landed before entry and payment of duty, or without warrant for landing, shall be forfeited and burnt; the ship also shall be forfeited, and the person concerned in importing or landing shall forfeit 5*l.* a hundred weight. 7 Geo. II. cap. 16. By 9 Anne, cap. 12. there shall be paid a duty of 1*l.* for every pound of *hops* grown in Great Britain, and made fit for use, within six months after they are cured and bagged; and *hop*-grounds are required to be entered on pain of 40*l.* an acre. Places of curing and keeping are also to be entered, on pain of 50*l.* which may be visited by an officer at any time without obstruction, under the penalty of 20*l.* All *hops* shall, within six weeks after gathering, be brought to such places to be cured and bagged, on pain of 5*l.* a pound. The rebagging of foreign *hops* in British bagging for sale or exportation, incurs a forfeiture of 10*l.* a hundred weight; and defrauding the king of his duty by using twice or oftener the same bag, with the officer's mark upon it, is liable to a penalty of 40*l.* The removal of *hops* before they have been bagged and weighed, incurs a penalty of 30*l.* Concealment of *hops* subjects to the forfeiture of 20*l.* and the concealed *hops*; and any person who shall privately convey away any *hops*, with intent to defraud the

king and owner, shall forfeit 6s. 2 pence; and the duties are required to be paid within six months after curing, bagging, and weighing, on pain of double duty; two-thirds to the king, and one third to the informer. No common heath, &c. shall use any bitter ingredient instead of hops, on pain of 20s. Hops, which have paid the duty, may be exported to Ireland; but by 6 Geo. II. cap. 11. there shall be no drawback; and by 7 Geo. II. cap. 12. no foreign hops shall be landed in Ireland. Notice of bagging and weighing shall be sent in writing to the officer, on pain of 50s. 6 Geo. cap. 21. And by 14 Geo. III. cap. 68. the officer shall, on pain of 5s. weigh the bags or packets, and mark on them the true weight or tare, the planter's name, and place of abode; and the date of the year in which such hops were grown; and the altering or forging, or obliterating such mark, incurs a forfeiture of 10s.

The owners of hops shall keep at their mills, &c. just weights and scales, and permit the officer to use them, on pain of 20s. 6 Geo. cap. 21. And by 10 Geo. III. cap. 44. a penalty of 100s. is inflicted for false scales and weights. The owners are allowed to use casks instead of bags, under the same regulations. 6 Geo. cap. 21. If any person shall mix with hops any drug to alter the colour or scent, he shall forfeit 5s. a hundred weight. If any person shall unlawfully and maliciously cut hop-stems growing on poles, in any plantation, he shall be guilty of felony, without benefit of clergy. 6 Geo. II. cap. 37. By a late act, five per cent. is added to the duties on hops.

Hot, *uult*. See *Hot* TREFOLI.

HOT-SPRINGS. See *HOT*.

HOT-SPRINGS, in Botany. See *HORNBEAM*.

HOPE, in Ethics, is the desire of some good, attended with the belief of the possibility, at least, of obtaining it, and enlivened with joy, greater or less, according to the greater or less probability of our possessing the object of our hope. Alexander, preparing for his Asian expedition, distributed his hereditary dominions among his friends; allotting to some villages, to others boroughs, to others cities; and being asked what he had reserved for himself, replied, *Hope*.

HOPEA, in Botany, a genus of the *polyadelphia polyandra* class. Its characters are, that the calyx is divided into five segments; the corolla has five petals; there are many stamens growing together in five bodies; the style is single and the fruit is a drupe, containing a three-celled nut. There is only one species.

HOPLITES, HOPLITA, formed of *hoplos*, armour, in *Antiquity*, were such of the candidates at the Olympic and other sacred games, as ran races in armour.

One of the finest pieces of the famous Parthian, was a palming which represented two hoplites; the one running and seeming to tread large drops; the other having his arms down, as quite spent, and out of breath. Pliny, lib. xxxv. cap. 10. and Pausanias, lib. vi. cap. 14.

HOPMAH, in Natural History, a name given by some of the writers among the ancients, to a kind of a shining brain-like appearance, looking like the surface of the polished brass-armour, worn in those times. It is easy to conclude, from this account, that the *hoplites* was one of our mummies.

HOPMATODROMOS, formed of *hoplos*, armour, and *dromos*, I run, in the ancient gymnastic sports, a term applied to fast persons as went through those tollsome and robust exercises, in complete armour; by which the exercise became much more violent, and the wearing of armour, in the time of battle, much more easy.

HOPLOCHIRISMA, a term used, by the ancient writers in *Medicine*, for the anointing a sword, or other weapon, with which a person had been wounded, in order to the curing of the wound; so early was the idle notion of curing by sympathetic remedies received in the world. Some late authors have also used the word in a very different sense, namely, for the anointing the points of darts or swords with poisonous ingredients, in order to render the least wound given with them fatal; a practice most known, as it is said, among the savage inhabitants of America.

HOPLOMACHI, *ὀπλομαχοί*, composed of *hoplos*, armour, and *machos*, fight, in *Antiquity*, were a species of gladiators, who fought in armour; either completely armed from head to foot, or only with a casque and cuirass.

HOPPER, a vessel wherein feed-corn is carried at the time of sowing.

The word is also used for that wooden trough in a mill into which the corn is put to be ground.

HORÆA, *ὥραι*, in *Antiquity*, solemn sacrifices, consisting of fruits, &c. offered in spring, summer, autumn, and winter, that heaven might grant mild and temperate weather. These, according to Macrobius, were offered to the goddesses, called *Horæ*, i. e. *Hours*, who were three in number,

attended upon the Sun, presided over the four seasons of the year, and had divine worship paid them at Athens.

Porter, *Archæol. Græc.* lib. ii. cap. 20. tom. i. p. 439.

HORARY, something relating to *hours*, *horæ*. See *Hour*.

HORARY circle of the globe. See *CIRCLE*.

HORARY circle. See *Hour-circle* and *CIRCLE*.

HORARY circles, or lines, in *Dialling*, are the lines or circles which mark the hours on *sun-dials*.

HORARY motion of the earth, is the arch it describes in the space of 24 hours.

This is nearly fifteen degrees; for the earth completes its revolution through 360° in a day, or twenty-four hours, and the twenty-fourth part of 360 is 15; though this is not the exact measure of the *horary* arch, because the earth moves with different velocity, according to its greater or lesser distance from the sun; but it is near enough for ordinary computations. See *EQUATOR* of time.

HORCUS *lepis*, the name of a stone, mentioned by the writers of the middle ages as useful in *stomachic* and other malads. All the descriptions they give of it is, that it was black, and was easily reduced to powder. It was called *stio catenis*.

HORD, HORDA, a Tartarian term, and literally denoting a multitude, in *Geography*, is also for a company or tribe of wandering people, which have no settled abode or habitation, but float about, dwelling in caravans, or under tents, to be ready to shift as soon as herbage, fruits, and the present promise is eaten here.

HORD is more properly the name which the Tartars, who inhabit beyond the *Volga*, in the Kingdoms of *Altai* and *Inguria*, give to their villages.

A herd consists of fifty or sixty tents ranged in a circle, leaving an open place in the middle. The inhabitants of each herd usually form a military company or troop; the chief whereof is commonly the captain, and depends on the general or prince of the whole nation.

HORDEATUM, a liquid medicine, made of barley boiled till it burst.

Sometimes other ingredients are added, as the cold seeds, almonds, and the like.

HORDEOLUM, from *hordeum*, barley, as resembling a barley-corn, in *Medicine*, a small tubercle arising on the outer verge of the palpebra, or eye-lid. See *STYE*.

HORDEUM, Barley, in Botany, a genus of the *triandria digynia* class. The characters are, that it hath a partial involucre of six narrow-pointed leaves, containing three flowers; the petal of the flower opens with two valves; the flower hath three hairy laminae, shorter than the petal; it hath an oval germen, supporting two reflex styles, which becomes an oblong beiled seed, pointed at both ends, with a longitudinal furrow, surmounted by the petal of the flower, which does not fall off.

Miller enumerates four species; viz. 1. The spring barley with many rows of grain, principally cultivated in England, of which the farmers make two sorts, the common and late-ripe barley, though the latter is only a variety produced from the other, by being long cultivated in warm gravelly lands. 2. The hard barley is easily distinguished by the two orders of the beards flanking each; the chaff is also thinner, and it is, therefore, esteemed better for malting. 3. The long-eared barley, the grains of which are regularly ranged in a double row, lying over each other like the scales of fishes; the chaff is very thin, and this barley is much valued for malting. 4. Sprat or battelore barley, with thicker and broader ears, longer beards, and shorter stem. 5. The square or bear barley, or bigg, sown in the northern counties, and generally in Scotland, with its grains disposed in six rows. This species is much harder than the others, but is not so good for malting.

For the culture and produce, &c. of barley, see *BARLEY*.

When barley and malt does not exceed 32s. a quarter, there is a duty on importation of 16s. by 22 Car. II. cap. 13. but when the price exceeds this rate, the duty is 21. 8d. a quarter by 15 Car. II. cap. 27. The duties on importation cease, when barley, bear, or bigg, shall be at or above 22s. a quarter, and in lieu of it, the duty shall be only 2d. a quarter, by 13 Geo. III. cap. 43.

When the price of barley, bear, or bigg, shall be at or above 22s. a quarter, exportation is prohibited under a penalty of 20s. a bushel, and forfeiture of the vessel, &c. 13 Geo. III. cap. 43.

By this statute the former bounty on exportation shall cease; and when barley, bear, or bigg, is under 22s. a quarter, there shall be allowed a bounty of 2s. 6d. for every quarter of barley, &c. or of malt. By 10 Geo. III. cap. 28. over and above all former duties upon malt, there shall be paid for every bushel of malt made in England, whether for sale or not, the sum of 6d.; in Scotland, the sum of 3d.; and if brought from Scotland into England 3d. more.

HORDICALIA, or HORDICINIA, in *Antiquity*, a religious feast held among the Romans, wherein they sacrificed cattle big with young.

The word *hordicalia* is formed of *horde*; which Festus explains

explains by *præcursus, prægnans, and cædi, I. sacrificii*. Ovid, in his *Fæsti*, lib. iv. ver. 631. describes *hordeum* as *fero*, to be *hordeum*, of *opos, proinde*.

This feast fell on the fifteenth of April, on which day they sacrificed thirty cows, big with calf, to the goddess Tellus, or Terra. Earth: part of them were sacrificed in the temple of Jupiter. The calves taken out of their bellies were burnt to ashes & hilt, by the pontifices, afterwards, by the effect of the Vestal virgins.

Alexander ab Alexandro, Genial. Dier. writes *hordeum*, and from him, some of the moderns call the feast *hordeum*; but Varro writes it *hordeum*, and Festus, *hordeum*.

HOREHOUND, *Morruum*, in *Rosæ*, a genus of the *dynamis gymnosperma* class. Its characters are these: the emplantment of the flower is funnel-shaped, of one leaf, and equal at the brim, which spreads open; the flower is of the lip kind, with a cylindrical tube, divided into two lips; it has four stamens, which are under the lip, two of which are somewhat longer than the other; it has a four-pointed germen, which afterward turns to four oblong seeds, sitting in the emplantment. There are fifteen species. Miller.

The leaves of the common white *horehound* or *perfolium*, with hooked bristles indurates to the emplantment, are said to be attenuant and resolvent; they are famous for the relief they give in small ulcers, and in all distiches of the breast and lungs, in which a thick and viscid matter is the cause. They are also capable of doing great good in menstrual suppression, cachexies, and other chemical disorders, proceeding from a viscosity of the fluids, and obstructions of the viscera. A dram of the dry leaves in powder, or two or three ounces of the expressed juice, or an infusion of half a handful, or a handful of the fresh leaves, are commonly directed for a dose. There used to be a compound syrup of it, called *syrupus de Perfolio*, which is now out of use. See *ASTRA*.

HOREHOUND, *hæf, Sisymbrium*, in *Rosæ*, a genus of the *dynamis gymnosperma* class. Its characters are these: the flower has a tubulous, permanent emplantment, cut into five acute parts at the top; and it has one lip-shaped petal, with a short tube, having oblong chords; the upper lip is erect, hooked, and a little indented at the point, being cut into three parts; it has four awl-shaped stamens, two of which are longer, and inclined to the upper lip; the other two are shorter, terminated by single summits; and it has a four-pointed germen, supporting a slender style of the length of the stamens, crowned by a bifid, acute stigma; the germen turns to four oblong, angular seeds, which ripen in the emplantment. Miller reckons eight species, and Linnaeus fifteen; adding to this genus some species of the *galathea*; one of these is common by the sides of ditches, and is ordered in the dispensaries as a good vulnerary herb.

HOREHOUND, *hæf, Sisymbrium*, in *Rosæ*, a genus of the *dynamis gymnosperma* class of plants: the flower is monopetalous and cloven, the upper lip being concave and crenated, and the lower oblate, and divided into three segments; the emplantment of the flower is funnel-shaped, terminated by five horizontal points, and marked with ten furrows. This is a common weed, growing on the sides of banks in moist parts of England, so is seldom allowed a place in gardens. There are two sorts of it, one with white, the other with purple flowers. Miller.

Linnaeus enumerates five species of this genus. Mr. Ray recommends a strong decoction of this plant in hysterical and hypochondriacal cases. Make a tea of equal parts of white *horehound*, *stinking horehound*, and betony leaves; three or four cups of it drank every day, will prevent the gout, or mitigate its attacks.

HOREHOUND, *water, Lycopus*, in *Rosæ*, the name of a genus of plants of the *dynamis gymnosperma* class; the characters of which are these: the flower consists of one leaf, and is of the labiated kind; but, in some degree, resembles the bell-shaped flowers; for the upper lip is scarce at all to be distinguished from the lower, so that the flower appears at first sight a tubular one, divided simply into four segments; the pistil arises from the cup, and is fixed in the manner of a nail to the lower part of the flower; it is surrounded by four embryos, which afterwards become as many seeds of a roundish form, and are contained in an open capsule, which was before the cup of the flower.

The species of *lycopodium* enumerated by Mr. Tournefort are four, and by Linnaeus two.

This plant grows in great plenty at the sides of ditches. **HORIZON**, or **HORIZON**, in *Astronomy*, a great circle of the sphere, dividing the world into two parts, or hemispheres; the one upper, and visible; the other lower, and hid.

VOL. II. N° 174.

The word is *apex*, which literally signifies *boundary*, or *terminating the sight*; being formed of *apex, terminus, de finis, I. bound, I. limit*; whence it is also called *finiter, finitior*.

The horizon is either *rational* or *sensible*.

HORIZON, *rational, true, or astronomical*, which is also called *simply* and *absolutely* the horizon, is a great circle, whose plane passes through the centre of the earth, and whose poles are the zenith and nadir. It divides the sphere into two equal parts, or hemispheres.

Such is the circle *HR* (*Tab. Astronom.*, fig. 72.) whose poles are the zenith and nadir; whence it follows, that the several points of the horizon are a quadrant distant from the zenith and nadir.

The meridian and vertical circles cut the rational horizon at right angles, and into equal parts.

HORIZON, *sensible, visible, or apparent*, is a lesser circle of the sphere, at *h*, which divides the visible part of the sphere from the invisible, and whose plane touches the spherical surface of the earth.

Its poles, too, are the zenith and nadir; and, consequently, the *sensible horizon* is parallel to the *rational*; and it is cut at right angles, and into two equal parts, by the verticals.

The *sensible horizon* is divided into *eastern* and *western*.

HORIZON, *the eastern, or eastern*, is that part of the horizon wherein the heavenly bodies rise.

HORIZON, *the western, or western*, is that wherein the stars set.

HORIZON, in *Geography*, is a circle passing over the earth, and dividing the visible part of the earth and heavens from that which is invisible.

The altitude, or elevation, of any point of the sphere, is an arch of a vertical circle, intercepted between it and the sensible horizon.

This is peculiarly denominated *sensible* or *apparent horizon*, to distinguish it from the *rational*, or *true*, which passes through the centre of the earth; as already observed.

These two horizons, though distant from one another by the semidiameter of the earth, will appear to coincide, when continued to the sphere of the fixed stars; because the earth compared with this sphere is but a point.

By *sensible horizon* is also frequently meant a circle, which determines the segment of the surface of the earth, over which the eye can reach; whilst also the *physical horizon*. In this sense we say, a spacious horizon; a narrow, scanty horizon.

It is evident, that the higher the eye is, the further is the visible horizon extended. Thus, let *H* be *R* (*Tab. Geography*, fig. 1.) represent a part of the spherical surface of the earth, if the eye be at *A*, draw *AA* and *AR* tangents to the globe of the earth; and let one of these lines *AA*, the point *A* continuing immovable, be carried round, and in its revolution always touch the surface of the earth; the point *B* will describe the visible horizon, part of which is represented by the curve *h*. But if the eye be placed higher, as at *B*, the tangents *BH* and *BR* will reach farther, and the visible horizon will be larger, viz. *HOR*. The visible horizon is most accurately observed upon the sea, and it, therefore, sometimes calls the horizon of the sea. In observing this horizon, the visual rays, *Ab* and *Ar*, will, on account of the spherical surface of the sea, always point a line below the true sensible horizon *SB*, and consequently below the rational horizon *TT*, which is parallel to it.

To find the depression of the horizon of the sea below the true horizon, which varies with the height of the eye, and in a small degree with the variation of the refractive power of the atmosphere, see *DIOPTRICS*.

The semidiameter of the earth and the height of the eye being given, the extent of the visible horizon is thus found. Let *ADE* (*Tab. Geography*, fig. 2.) be an arch of a great circle upon the earth, *C* the centre of the earth, *B* the eye of the observer, *AD* the height of the eye, *BA* and *BE* lines drawn from the eye, touching the surface of the earth at *A* and *E*, and terminating the visible horizon: in order to find *AD*, draw *CA*, and in the triangle *BAC*, right-angled at *A*, we have *CB* to *CA* as the whole sine or radius is to the sine of the angle *ABC*, whose complement is the angle *C*, measured by the arc *AD*. E. g. Let *DB*, the height of the eye, be five feet, *DC*, or *CA*, the semidiameter of the earth, be 20946655 feet, and *CB* will be 20946660 feet: when will the logarithm of *CB* be to that of *CA*, or 7.310769 to 7.310768 as 10.000000 to 9.999999, the sine of *ABC* = 89° 58', therefore the angle *C* is = 2' or 12.188 feet = 2.308 miles, or two miles 542 yards, nearly. *BA*, or the right-lined distance of the farthest point of sight from the eye, may easily be found, as the angles and other sides are known; thus, radius or sine of the angle *A* is to *CB* as the sine of *C* is to *BA* or, since *BA*

12 B

= CB

$= CB - CA = CB - CA \times CB - CA$, if the logarithm of the sum of the two given sides be added to that of their difference, the half of these two logarithms will be equal to the logarithm of BA, nearly; i. e. $7.6133064 + 0.0789700$

$= 4.1665884$, the logarithm of 14474 feet = BA, nearly. See DISTANCE.

The depression of the horizon of the sea at a given height of the eye, may be thus found by calculation; for if the eye be at B, the sensible horizon is FG, the depression is the angle FBA, which being the complement of ABC, is equal to ACD. See DEPRESSION.

The distance on a perfect globe, if the visual rays came to the eye in a straight line, would be as it has been now stated; but by means of the REFRACTION of the atmosphere, distant objects on the horizon appear higher than they really are and may be seen at a greater distance, especially on the sea. Thus, without refraction, the most distant part of the sea visible to the eye at B, would be A; but refraction elevates the part of the sea, which is farther from the eye than A, so that the tangent or visual ray shall fall upon a more distant point, as H, and consequently the extent of the visible horizon is enlarged by refraction; for it is DH, instead of DA; and refraction makes the angle of depression less than it would be, viz. HBF, instead of ABF.

Father Laval, professor of hydrography at Marseilles, found, that the horizon of his observatory toward the sea was never more than 15 minutes, nor less than 13; that is, the arch of the circumference of the earth, intercepted between the observatory and the horizon, fluctuated between those two quantities; whence M. Cassini deduces, that the extent of the horizon is seven French leagues, of three miles each, and that the observatory is 175 feet high.

The height of the horizon, at the same place, and the same elevation above it, is very subject to vary, by means of differences in the atmosphere, which occasion others in the refractions.

When the sea was full, or the north-west or south-west wind blew, and the air hazy about the horizon, F. Laval always found his horizon depressed, or lower; i. e. the refraction which should raise it in that case was less than ordinary. And yet, on the common principles, the air being now much charged with vapours, the very contrary was rather to be expected. This makes M. Cassini suspect that there is some other refractive matter in the atmosphere, beside the air itself.

The same author observes, that at a height ten times greater than that of F. Laval's observatory, he found the arch terminated by the horizon toward the sea, without any sensible variation; whence he concludes, that the variations are the greater, as the height is the less; which may seem contrary to what he had asserted in another place, viz. that the variations in the apparent altitudes of bodies are greater, as these objects are more remote, because they are seen through the larger quantity of air, which is liable to be varied. But the contradiction may be solved.

HORIZON of the globe. See GLOBE.

HORIZONTAL, something that relates to the horizon, or that is taken in the horizon, or on a level with the horizon.

We say, a horizontal plane, horizontal line, horizontal distance, &c.

HORIZONTAL dial, is that drawn on a plane parallel to the horizon; having its gnomon, or style, elevated according to the altitude of the pole of the place it is designed for.

Horizontal dials are of all others the most simple and easy. The manner of describing them, see under the article DIAL.

HORIZONTAL distance. See DISTANCE.

HORIZONTAL line, in Perspective, is a right line drawn through the principal point, parallel to the horizon; or it is the intersection of the horizontal and perspective planes.

Such is the line PL (Tab. Perspective, fig. 12.) passing through the principal point F.

HORIZONTAL line, or base of a hill, in Surveying, a line drawn on the horizontal plane of the hill, or that on which it stands.

HORIZONTAL man. See APPARENT MAGNITUDE.

HORIZONTAL parallel. See PARALLEL.

HORIZONTAL plane, is that which is parallel to the horizon of the place, or not inclined to it.

The business of LEVELLING is, to find whether two points be in the horizontal plane; or how much the deviation is.

HORIZONTAL plane, in Perspective. See PLANE.

HORIZONTAL projection. See PROJECTION and MAP.

HORIZONTAL range, or level range, of a piece of ordnance, is the line it describes, when directed parallel to the horizon, or horizontal line.

Dr. Halley gives two very ready theorems: the one, to find the greatest horizontal range at 45 degrees elevation, in any shot made upon any inclined plane, with any elevation of the piece whatsoever; and the other, to find elevations proper to strike a given object with any force, greater than what is sufficient to reach it with the middle elevation.

1. A shot being made on an inclined plane; having the horizontal distance of the object it strikes, with the elevation of the piece, and the angle at the gun between the object and the perpendicular, to find the greatest horizontal range of that piece laden with the same charge; that is, half the latus rectum of all the parabolas made with the same impetus. Take half the distance of the object from the nautilus, and the difference of the given elevation from that half; subtract the vertex line of that difference from the vertex line of the distance of the object from the zenith (the difference of those vertex lines will be the sine of the distance of the object from the zenith, as the horizontal distance of the object struck, to the greatest range at 45 degrees.

2. Having the greatest horizontal range of a gun, the horizontal distance and angle of inclination of an object to the perpendicular; to find the two elevations necessary to strike that object. Halve the distance of the object from the nautilus; this half is equal to the half sum of the two elevations sought; then say, as the greatest horizontal range is to the horizontal distance of the object, so is the sine of the angle of inclination, or distance of the object from the perpendicular, to a fourth proportional which fourth being subtracted from the vertex sine of the distance of the object from the zenith, leaves the vertex sine of half the difference of the elevations sought; which elevations are therefore had, by adding and subtracting that half of the difference to and from the above sum. See PROJECTILE and GUNNERY.

HORIZONTAL refraction. See REFRACTION.

HORIZONTAL rest. See FIRELOCK rest.

HORIZONTAL shelter, among Gardeners, are defences, disposed parallel to the horizon, for tender plants, blossoms, and fruits, in the spring, to defend them against dials, and pinching nights.

The usual shelters that have obtained, are bays mats, and other warm coverings, which are rolled up in the day-time, and let down in the night. It was the reverend Mr. Lawrence who first proposed horizontal shelters, chiefly on this principle; the most of our fruits and blossoms fall perpendicularly, i. e. the condensed vapours, falling from the upper region, do at night form themselves, toward the surface of the earth, into drops of dew, subject to be frozen by the coldness of the air.

Horizontal shelters are to be made by laying rows of tiles, at certain distances one above another, in the structure of the wall, so as to project or hang over the plane of the wall, to carry off the dew, wet &c. It is an inconvenience, objected to this method, that it is difficult to lead a tree rightly among the tiles, or to keep its figure duly filled up.

But the principal objection against these tiles is this, that they prevent vegetables from receiving the advantage of dews, rains, &c. in consequence of which they become weak and languid, and at last entirely decay. The only sort of horizontal shelter, which Mr. Miller has ever observed to be useful for fruit-trees, are made with two leaves of bit-lead, joined over each other, and painted. This kind of shelter being fixed upon the top of the wall with pulleys, to draw up and down at pleasure, forms a sort of pent-house; which being let down in great rains or cold nights, whilst the trees are in flower, or the fruit is setting, proves serviceable; but it must be removed soon after the fruit is set, so that the trees may enjoy all the advantages of rain, dew, &c. in the summer, which are absolutely necessary for producing healthy trees, or good fruit.

HORIZONTAL speculum. One of the great inconveniences mariners have to struggle with, is the frequent want of a horizon; for though the atmosphere may, at the height of ten or twelve degrees and upward, be clear enough to give a view of the sun and other objects, yet all below that height is often so hazy, as to hinder a distinct sight of the horizon, and consequently to prevent observations from having the requisite correctness. This inconvenience is removed by a horizontal speculum invented by Mr. Serfon, who was lost in the Victory man of war, in which ship he was sent out to make trial of his machine.

The principle on which this machine was constructed, was derived from the consideration of a top while spinning: for this author observing that the top had a considerable

derable degree of steadiness in, and force to acquire, an upright motion, whether the body which sustained it was in motion or at rest: he therefore concluded, that if a circular machine, whose upper face was a flat polished speculum, was to have a swift circular motion communicated to it, that speculum, by acquiring a horizontal situation, would show all objects which it reflected, as much below the horizon, as they really are above it. Consequently, if the image of the sun, as seen reflected from the speculum, were made to coincide with the sun's image seen in a Hadley's quadrant, the angle given by the quadrant would in all cases be double the real altitude. Mr. Serlon also found, that to confine the speculum to one place, it was necessary to let the point spin in a cup; for the horizontality of the speculum would not be altered, whatever position might be given to the cup; provided it touched only at the point on which it spun. This curious and useful instrument, as it is now improved by Mr. Smeaton, consists in a well polished metal speculum, of about three inches and a half in diameter, inclosed within a circular rim of brass: is fitted that the centre of gravity of the whole shall fall near the point whereon it spins. This is the end of a steel axis running through the centre of the speculum, above which it finishes in a square, for the convenience of fitting a roller on it, by which it is set in motion by means of a piece of tape wound round the roller. The cup in which it spins, is made of silver, tin, or other hard substance, and a pyramidal cover may be made to the whole, composed of glass panes: by this means an observation may be made with it, as well covered as open, and it will thereby be prevented from tarnishing by the moist air and spray of the sea.

If the box be placed steadily, and as level as may be, after the tape is untwisted, the speculum will be fit for observation in less than two minutes, and will generally continue to run twelve or fifteen. When it is to be used for a meridian observation, it may be convenient to know what time to set it up; and this may be had near enough by taking the sun's bearing from the meridian with an azimuth compass, allowing for the variation; and if it has about five degrees to run before it culminates, it is then time to spin the speculum. The observer is to place himself as near the box as he conveniently can, and look down on the sun's image in the speculum, and bring the sun's image seen in the quadrant to agree with it, so that their centres coincide; the quadrant will then give the double altitude, without any allowance for the height of the ship, or the sun's semidiameter.

When the sun is about 45° high, the observer must look through that sight of the quadrant, which is used for a back observation; but he must look down on the horizontal image, or that in the speculum, as it was the back horizon; and then making the solar images to agree, the quadrant according as it is numbered, will give the double altitude, or double zenith distance.

These speculums are as useful by night as by day; for as the images of the smallest stars may be seen in the speculum, consequently any object that can be seen reflected from its glazes of the quadrant, may be observed by the speculum; and these are all the stars of the first magnitude, the planets Venus, Mars, Jupiter, Saturn, and the Moon. So that by having the declinations of these bodies in an ephemeris, they may be used in observations as well as the sun.

As the great distresses to which ships are sometimes driven in several parts of the world, for want of a horizon to observe by, are by this ingenious contrivance quite removed, it is hoped the use of this instrument may become general. See **HADLEY'S QUADRANT**.

HORMEZION, or HOMERION, in *Natural History*, the name of a gem described by Pliny, and seeming to have been a species of *HYACINTH*. He says it was very bright, and of a yellowish red or flame colour, with a whitish cast at the edges.

HORMINODES, in *Natural History*, the name of a gem described by Pliny, and others of the ancient writers. The stone itself, they tell us, was either black or white, but had in it a green speck, surrounded by a circle of a bright yellow. It seems to have been no other than one of the opals bel's of our jewellers.

HORMINUM, in *Botany*. See **CLARY**.

HORMINUM, Pyreanum Clary, in the Linnean system of *Botany*, a genus of the *diandria monospermia* class; the calyx is bell-shaped, with four equal segments, and a fifth, which is larger, and emarginated; the upper lip of the corolla is concave. There are two species.

HORN, CORNU, a hard, callous substance, growing on the head of divers animals, and serving them as weapons of offence and defence.

It is laid down as a rule, by some naturalists, that no animals have horns but those that are cloven-footed.

The horns are usually a double part; inasmuch that there is but one exception, which is in the rhinoceros.

The horns of many animals, particularly of the deer-kind, are call every year, and new ones grow up in their places. With us the deer drop them in March, and the new horns are full grown by the July following. Voltaire very justly ranks this among the most wonderful phenomena of nature: he says, that we have nothing analogous to the growth of such hard and solid bodies of so great a bulk, in so short a time.

The growth and falling of the horns of deer is a very singular circumstance in the animal world. The stag puts out its first horns in the second year of its age, and after this they cast them every year in March. The felly and well fed ones call their horns first; the sickly or weak ones sometimes keep the old ones till the end of April. These horns are fallen to the bones of the skull, nor to the skin of the head only, as some people would have it thought, who are for making the casting of them the last wonder of the world. About ten days after the horns are cast, the new or young horns begin to appear: they are soft and hairy at first, but they grow hard in about three months, and the stag then rubs off their hairy skin.

Many idle opinions have been formed of the cause of the falling of these parts of the animal; and worms in the head, and many other things, have been supposed instrumental to it, which have no share in it. The true reason seems, that these are a sort of vegetables growing on the animal, as our nails and hair have by many been said also to be; and there appears a great analogy between them and the sprouting of the leaves and branches in trees and plants. Trees commonly cast their ripe fruit in summer, and drop their leaves in autumn, because the sap, or nourishing juice, flows into them no longer; and in the same manner, at certain stated periods, the blood and juices cease to flow into these parts of the animal, and they drop off. The cavernous part, at the root of the horns, probably grows hard, and the pores through which the vessels pass, grow up at this time; and then, as no juices can be carried through them to the horn, it is not at all wonderful that it decays, and falls off, for want of nourishment.

It is probable that this stoppage of the pores, and denying of the passage of any juices, happen in the horns as soon as they are arrived at their full growth in July; but they are so firmly fixed to the head, that it takes a long time for them to loosen and fall; whereas in the leaves of plants the pedicles are so tender, that they wither and fall immediately on the juices ceasing to flow into them. This analogy between the operations of nature, in the casting the horns of deer, and the falling off of ripe fruit and leaves from vegetables, derives great force from observation of the orange and other trees. If the stalk, from which a ripe orange has fallen, be compared with that part of the forehead of a deer from which a horn is just fallen, there will be seen such a similarity between the one and the other, that it will appear very obvious, that nature has operated by the same laws in both. Phil. Trans. N° 227, p. 404.

The number of branches in the horns is proportioned to the age of the animal, the young ones always having but few, the old ones most. Six or seven branches are the common number, and in Tuscany they have sometimes eight or nine. But in Saxony, where these creatures are very long lived, they are sometimes seen with fourteen or fifteen branches, and sometimes more. The young horns, while yet soft, are full of blood-vessels; and if cut off, especially near the head, they are found to bleed very violently, and the creature will sometimes even bleed to death at the wound. This blood was found by Redi to coagulate also like the other blood of the stag, let out of the other parts of the body; though this is contrary to the accounts of Aristotle and Galen. Blood-vessels are sent in large numbers into all horns, while young, to furnish them with nourishment for their increase and growth; but when they are arrived at their full growth, these vessels dry up, there being no farther occasion for them; and hence it is that no ill symptoms attend the falling off of these parts, when full grown. If a stag be castrated while he is so young as not to have horns, he will never have any at all, and if castrated afterwards, while his horns are on, he will never cast them, but always retain the same pair which he had at the time of the operation. The horns of a deer are by hunters called his head.

In the history of the French Academy of Sciences, we have an account of a bullock's horn, dug out of the ground in plowing, which had their forth fibrous roots, and appeared to have grown, or vegetated, after the manner of a plant.

Horns make a considerable article in the arts and manufactures. Bullocks' horns, softened by the fire, serve to make

make lanterns, combs, knives, ink-horns, tobacco-boxes, &c.

HORN, joining of. See BONES, DYING, IVORY, TORTOISE-SHELL, and WOOD.

HORN is sometimes also used for the hoof of a horse, &c.

HORN, Amian't. See CORNU AMIAN'T.

HORN-HEAD, is a black or green indurated hole or clay, consisting of staly particles, which are distinguishable from those of mica, by being less shining, thicker, and rectangular. It is generally found among iron ores, and sometimes intermixed with mica, forming a compact stone.

HORN, herti, cornu cervi. The scrapings or raspings of the horn of this animal are medicinal, and used in decoctions, pills, &c.

Hornwort-jelly is nutritive and strengthening, and is sometimes given in diarrhoea; but a decoction of burnt hornwort in water is more frequently used for this purpose, and is called *hornwort drink*.

The coal of *hornwort*, by being calcined with a long continued and strong fire, is changed into a very white earth, called *hornwort calcined* to whiteness. This earth is employed in medicine as an absorbent, and administered in dysenteries and labour-pains, which are supposed to be caused by acrid and ill-digested matters. This earth leavens it the basis of Sydenham's white decoction, which is commonly prescribed in the dysenteries.

The salt of *hornwort* is a great sudorific, and given in fevers with success; and *hornwort* also yields, by distillation, a very penetrative volatile spirit.

HORN, in the *Manege*. To give a stroke with the horn, is to bleed a horse in the roof of the mouth, with the horn of a flag or rebuck, the tip or end of which is so sharp and pointed, as to produce the same effect as a lancet. They strike with the horn in the middle of the fourth notch or ridge of the upper jaw.

HORN-tipped. A horse is said to be so, when the tops of the two bunch-bones appear too high.

HORN is also a sort of musical instrument, of the wind kind; chiefly used in hunting, to animate and bring together the dogs, and the hunters.

The *horn* may have all the extent of the trumpet.

The term for sounding anciently was, wind a *horn*; all horns being in those times compassed: but since brass horns are come in fashion, they lay, blow a *horn*, and sometimes, plainly sound a *horn*.

There are various lessons on a *horn*; as the recede, double recede, royal recede, running or farwell recede, &c. See RECREAT.

The French *horn* is no other than a wreathed or contorted trumpet. It labours under the same defects as the trumpet itself; but these have of late been so palliated, as to require no particular selection of keys for this instrument. In the beginning of the year 1773, a foreigner, named Spandau, played in a concert at the Opera-house a concerto, part whereof was in the key of C, with the minor-third, in the performance of which all the intervals seemed to be as perfect as in any wind-instrument. This improvement was effected by putting his right-hand into the bottom or bell of the instrument, and attempting the sounds by the application of his fingers to different parts of the tube.

The Hebrews made use of *horns*, formed of rams horns, to proclaim the jubilee; whence the name JUBILEE.

HORN of the unicorn, two proceeds arising from the sides of the fund. See UTICUS.

HORN, in Architecture, is sometimes used for VOLUTE.

HORN of plenty. See CORNUCOPIA.

HORN with horn, or **HORN under horn** (*cornutum cum cornu*), is when there is common for cause de vicinage, intercommunion of horned beasts. See COMMON and INTERCOMMUNING.

HORN, in Birds, See SMALL TARTOIL.

HORN and *hedgehog*. See LUCERNE.

HORN of infants. See FEELERS.

HORN, *fish*. See MOOSE-DEER, and ELK.

HORN-hill, in Ornithology. See HUCKLEBERRY.

HORN-OUSE, a name given by fowlers to the great horn-owl.

A sportsman who has got one of these birds, has a constant lure to draw together almost what numbers of others he pleases. The method of taking other birds by it, is this: the sportsman fixes upon some single tree, which stands in the middle of an open field, and cutting the boughs of this into a regularity, he spreads nets all about it, and then places his owl within them, with a string fastened to its leg, by means of which the bird may be put in motion by the sportsman as he stands at a distance under covert. There are to be two perches placed near one another, so that the owl can easily go from the one to the other. It is the nature of this bird to fly only by night, and therefore whenever it is seen by day-light, all the other birds quarrel with it, and abuse it; even the hawks will make at it wherever it comes in their way.

The sportsman depends upon this; and as soon as he sees any bird approach, or as soon as the owl, who sees farther than he can, gives him the signal that some bird is in sight, he pulls the string, on which the owl, being disturbed, flies from one perch to the other. This draws the strange bird to him, and flying violently at her, it is entangled in the net placed with that intent, and the sportsman must immediately run up and take it out, and replace the net for the next.

HORN-FISH, an English name for the fish which we also call the gar fish. It is by some accounted a species of the acua or tobacco-pipe fish; but the only reason for this opinion seems to have been, that it is as long and slender as that fish. It is properly a species of pike or elox. See ACUA and ELOX.

HORN-FISH, in Ichthyology. See CORNUATUS PISCIS.

HORN-HOW, in Ornithology. See OWL.

HORN-WORK, in Fortification, a sort of out-work, advancing toward the field, to cover and defend a curtain, bastion, or other place, supposed so to weaken that the rest: as also to possess a height, &c. See TAB. II. Fortification, fig. 21. No. 2. lit. f.

It consists of a front and two branches; the front is made into two demi-bastions, and a curtain in its files, or flanks, are usually parallel; though sometimes they approach or contract towards the place, forming what they call a *quadrangle*, or *lozenge* tail.

When the ditches are too long, they sometimes make epaulements to flank them. The parts of the *horn-work* next the country are to be defended by a parapet.

For the construction of *horn-work*, produce the capital of the ravelin beyond the salient angle A (Tab. VIII. Fortification, fig. 2) to the distance AB, of about eighty toises; draw BDE at right angles to AB, in which take BD, BE, each equal to fifty-five toises; and on the outward side DE, trace the front of a polygon in the same manner as that of the body of the place, making the perpendicular BF eighteen toises, and the base thirty-five toises; draw DE, EI, of the *horn-work*, when produced, terminate on the faces of the bastions, within five toises of the shoulders. The ditch of the *horn-work* is twelve toises, and its counter-scarp parallel to the branches, and in the front terminates at the shoulders. The capital of the ravelin before the front of the *horn-work* is thirty-five toises, and the faces terminate on the shoulders, or rather two or three toises beyond them; and the ditch before the ravelin is eight toises. There are sometimes made reinforcements within the *horn-work*, such as S, S', which are constructed by erecting perpendiculars to the faces of the ravelin, within twenty-five toises of their extremities. This reinforcement, like all others, has a parapet topped only with a beam of eight feet before it, and likewise, a ditch from three to five toises broad. When a *horn-work* is made before the bastion, the distance of the front from the salient angle of the bastion is a hundred toises; and the branches terminate on the faces of the adjacent ravelins within five toises from their extremities; the rest of the construction is as before.

Two *horn-works* joined together make a *CROWN-WORK*, which is constructed by defending from the salient angle A (fig. 43) of the ravelin, as a centre, an arc of a circle, with a radius of about 120 toises, cutting the capital of the ravelin produced at C; from the point C set off the chords CB, CP, each equal to a hundred and ten toises, and on each of these construct the front of a polygon of the same dimensions, as in the *horn-work*, that is, the perpendicular should be eighteen toises, the faces thirty, and the branches terminate on the faces of the bastions, within twenty-five toises of the shoulders. The ditch is twelve toises; the capital of the ravelin thirty-five, and its ditch eight. When the *crown-work* is made before the bastion, the arc is described from the salient angle of the bastion, with a radius of a hundred and twenty toises, and the branches terminate on the faces of the adjacent ravelins, within twenty-five toises of their extremities, &c. as before. Muller's Elem. of Fortif. p. 30. &c.

HORNACHUM, **HORNAGE**, in our ancient *Law Books*, seems to import the same with *herbage*.

HORN-BEAM, *Caryophyllus*, in Botany, a genus of the monomia polyandra class. Its characters are these; it has male and female flowers, growing separate on the same plant; the male flowers are disposed in a cylindrical cops or catkin, and have ten small stamens; the female flowers are disposed in the same form, and have one petal shaped like a cup, cut into six parts, with two short germina; the catkin afterwards grows larger, and at the base of each scale is lodged an oval singular nut. There are four species. Miller.

Linnaeus enumerates only two species.

The *hornbeam* is very common in many parts of England, but

but is rarely suffered to grow as a timber-tree, being generally reduced to pollards by the country people; yet where the young trees have been properly treated, they have grown to a large size.

These trees will thrive on cold and barren hills, and may therefore be cultivated in such places with great advantage. When they are designed for timber, they should be raised from seeds in the same soil and situation where they are designed to grow. The seeds should be sown in the autumn, soon after they are ripe. As the plants grow up, they should be kept free from weeds, and in two years time they will be fit to transplant; and as the trees advance in their growth they should be carefully thinned.

The timber of this tree is very tough and flexible, and might be converted to many useful purposes, if suffered to grow to a proper size; but as it has been generally treated otherwise, for the principal uses it has been applied to have been for turnery ware, for which it is an excellent wood, and also for making mill-cogs, heads of beetles, &c. It is also excellent fuel. Miller's Gard. Dict.

HORNBEAM *Spiræa*, a denomination given by some to trees of this species, which have been topped, and are of about twenty years growth. See **FAIR**.

HORNED LEPIDOPTERON. See **POPPY**.

HORNET, *Crabro*, in *Zoology*, a species of the wasp, with a black thorax, and double black spots on the segments of the abdomen. This insect is very bold and venomous; and wholly resembles the wasp, only it is twice as large, and that the head is of a longer and slenderer shape, and the eyes formed somewhat like a half moon. They build under ground, and in winter hide themselves in hollow trees. They feed on flesh, and when very hungry, will seize upon a small bird. Mouffett relates, that they have been seen singly to pursue and kill a sparrow, and afterwards feed on its flesh. See **WASP**.

HORNET-FLY, in *Natural History*, a very large two-winged fly, which has the shape and colours of the *burnet*, and is, at first sight, scarce to be distinguished from it. The principal colour of the body of this fly is yellow; but it has two long and large black lines placed transversely on it, and has a black corcellet, and a yellow head.

These lay, at a proper season, a great number of oblong white eggs, which hatch into large and long worms, whose chief food is the worms and nymphs of the humble bees. The worm of this fly is continually found in the nests of these bees, where it never meddles either with the wax or honey, but preys only on the young offspring of the creature.

HORNGELD signifies a tax, within the forest, to be paid for the feeding of horned beasts. See **GELD**.

Quæritum esse omni collectum in foresta de bestis cornutis, &c. Et sine quiete de omnibus velis, & Dunsford, & Widdelton, & Jorgelid, & horngeid, &c.

To be free of *horngeid*, is a privilege granted by the king to such as he thinks good.

HORNPIPE, a common instrument of music in Wales, consisting of a wooden pipe, with holes at stated distances, and a horn at each end: the one to collect the wind blown into it by the mouth, and the other to carry off the sounds as modulated by the performer. See the description and form of this instrument, by the honourable Daines Barrington, in *Archæol.* vol. iii. p. 33.

HORNPIPE is also the name of an English air, probably derived from the above instrument. The measure of this air is triple time, with six crotchets in a bar; four of which are to be beat with the hand down, and two up.

HORNSTEIN, in *Natural History*, is a name given in Germany to the siliceous stone, called in England chert, or chert.

HORODICTIC *quadrant*. See **QUADRANT**.

HOROGRAPHY, compounded of *hora*, hour, and *graphein*, I write, the art of making or constructing dials; called also *horographia*, *gnomonica*, *fiatistica*, *photocatholica*, &c. See **DIALING**.

HOROLOGIOGRAPHY, the art of making or constructing dials. See **DIALING**.

HOROLOGIUM, *ῥολογιον*, composed of *hora*, time, hour, and *logos*, speech, discourse, a common name, among ancient writers, for any instrument or machine for measuring the hours. See **CHRONOMETER**.

Such are our clocks, watches, sun-dials, &c. See **CLOCK**, **WATCH**, **DIAL**, and **CLEPSIDRA**.

Modern inventions, and gradual improvements, have given birth to some new terms that come properly under this head, and annexed new meanings to others totally different to what they had originally. All chronometers that announced the hour by striking on a bell, were called *clocks*: thus, we read of pocket-clocks, though nothing could seem more absurd than to suppose that a clock, according to the modern idea, should be carried in the pocket. In like manner, all clocks that did not

strike the hour were called *watches*, or *time-pieces*; and the different parts of a striking clock were distinguished by the watch-part, and the clock-part, the former, meaning that part which measures the time, and the latter, the part which proclaims the hours. In the report of Sir Isaac Newton to the house of commons, anno 1713, relative to the longitude bill, he states the difficulties of ascertaining the longitude by means of a watch; yet it is obvious, from several circumstances, that his remarks were directly to be understood of a time-piece, regulated by a pendulum; for his objections are founded on the known properties of the pendulum, some of which differ essentially from the properties of the balance and spring. It is also to be remembered, that all the attempts of Huygens for finding the longitude were by means of pendulum clocks, that did not strike the hour, and; consequently, according to the language of the times, were called watches. At this time such machines for measuring time as are fixed in their place, are called *clocks*; if they strike the hour, if they do not strike the hour, they are called *time-pieces*; and when constructed with more care, for a more accurate measure of time, they are called *regulators*. Some artists of late have affected to call such watches as were constructed for astronomical and nautical observations, by the name of *time-pieces*, probably to intimate that they possess the advantages of those constructed with a pendulum.

Mr. John Harrison first gave the name of **TIME-KEEPER** to his watch, for the performance of which he received from parliament the sum of twenty thousand pounds. See **LONGITUDE**.

For the account of the principles of this machine, see **TIME-KEEPER**. And for the chief improvements that have been made for the more accurate measure of time, see **PALLETS**, **PENDULUM**, **SCAPEMENT**, and **THERMOMETER**.

HOROLOGION, **HOROLON**, is also a name the Greeks give to their liturgy, or breviary; because it contains the daily hours, or the several offices to be rehearsed each day.

The Greeks call it *apocryphus*, which answers to what in Latin and English we call *diurnal*, or *diurnal*. The *apocryphus* is the breviary of the Greeks.

HOROMETRY, the art of measuring and dividing the hours, and keeping an account of time.

HOROPTER, in *Optics*, is a right line, drawn through the point where the two optic axes meet, parallel to that which joins the centres of the two eyes, or the two pupils.

Such is the line AB (*Tab. II. Optics*, fig. 31.) drawn through the point of concourse C, of the optic axes of the eyes D and E, parallel to HI, which joins the centres of the eyes H and I.

It is called *horopter*; as being found, by experience, to be the limit of distinct vision.

The *horopter* has several properties in optics, which are described at large in Aguilonius, Opt. lib. II. Dist. 10.

HOROPTER, plane of the. See **PLANE OF THE HOROPTER**.

HOROSCOPE, in *Astronomy*, the degree or point of the heavens rising above the eastern point of the horizon, at any time given when a prediction is to be made of a future event: as, the fortune of a person then born, the success of a design then laid, the weather, &c.

The word is composed of *hora*, hour, and *skopein*, to observe, *scopos*, consider, I consider. The Latins call it *cardo orientalis*; sometimes *ascendens*. See **ASCENDANT**.

They were formerly so infatuated with *horoscopes*, that Albertus Magnus, Cardan, and others, are said to have had the temerity to draw that of Jesus Christ.

HOROSCOPE is also used for a scheme, or figure, of the twelve houses; i.e. the twelve signs of the zodiac, wherein is marked the disposition of the heavens for any given time.

Thus we say, to draw a *horoscope*, construct a *horoscope*, &c. we call it, more peculiarly, *calculating a nativity*, when the life and fortune of a person are the subject of the prediction; for they draw *horoscopes* of cities, great enterprises, &c. See **HORUS**.

HOROSCOPE, *lunar*, is the point which the moon issues out of, when the sun is in the ascending point of the east.

This is also called the *part of fortune*.

HOROSCOPE is also a mathematical instrument, in manner of a planisphere; but now disused.

It was invented by J. Paduanus, who composed a special treatise thereon.

HORREA, in *Roman Antiquity*, were public magazines of corn and salt meat, out of which the soldiers were furnished on their march in the military roads of the empire.

Horrea was also the name which they gave to their **GRANARIES**.

HORROR, *Horrova*, strictly signifies such an excess of fear as makes a person tremble. It is a compound of admiration and fear, not without an occasional mixture of pleasure, from which, when predominant, it is denominated a pleasing *horror*. In *Physis*, it denotes such a shuddering, or quivering, as precedes an ague-fit, and is often joined with rigors, and tumblings. See *AGUE*, *FEVER*, &c.

Through ignorance of this acceptation, some have understood fear to be accounted by authors among the antecedent symptoms of those distempers.

HORROR of a vacuum was an imaginary principle among the ancient philosophers, to which they ascribed the ascent of water in pumps, and other similar phenomena, which are now known to be occasioned by the weight of the air.

HORS *de sa fer*, *q. d.* out of his fer, is an exception to avoid an action brought for rent, or other service, issuing out of certain lands, by him that pretends to be the lord. For if the defendant can prove the land to be without the compass of his fee, the action fails.

HORSE, *Equus*, in *Zoology*. In the Linnæan system this makes a distinct genus of animals, of the order of *tel-hee*, the characters of which are: that the fore-teeth are six in each jaw, the upper erect and pointed, the lower more prominent; the canine, or dog-teeth, are single, placed at a distance from the others; and are but little longer than they, and the hoof consists of one piece. According to these characters, the author includes in this genus the *Equus caballus* with a hairy tail, or *horse*, the wild ass, the *mulle*, and the *zebra*, or, as he calls it, the striped *horse*.

The *horse* makes the subject of a very extensive art, called *HORTEMANSHIP*, consisting of divers subordinate arts or branches.

From the same beast also arise the professions of chivalry, knighthood, &c.

Authors are divided as to the time when men first began to mount *horses*. The scholiast of Euripides, and Eustathius on the second book of the *Iliad*, speak as if the ancients had been unacquainted with the use of saddle-horses, and had only used them to draw chariots, &c. They add, that courtes on *horse-back* were not introduced at the Olympic games before the fiftieth Olympiad. But this can scarce be; because the Centaurs, to whom the invention is attributed, lived long before that time. Besides Homer, though he mentions only chariot in his account of the siege of Troy, speaks of riding so familiarly in some parts of his *Iliad* and *Odyssey*, that it must have been practised among the Greeks before he composed either of these poems. In the fifteenth book of the *Iliad* he represents the strength and activity of Ajax, when he fought in defence of the Grecian ships that were attacked by the Trojans, and leaped from one ship to another, by the readiest and surest with which a skillful horseman would vault from the back of one *horse* to that of another, and his ability to defend many ships at once by that of the accomplished rider, who is capable of managing and controuling several *horses* at the same time. This comparison proves not only that riding was commonly known at the time when Homer wrote, but that it must have been studied and cultivated with great care and attention. In the fifth book of the *Odyssey*, the poet compares Ulysses, shipwrecked and sitting astride a plank which was floating on the waves, to a man belinding a *horse*, and keeping his feet in spite of the motions which the animal could make. Herodotus, in Thales, speaks of hunting on *horse-back*, as an exercise practised in the time of Darius: in Melpomene, likewise, he says, the Amazons hunted on *horse-back*, with their husbands, the Scythians. Xenophon says, that Cyrus hunted on *horse-back*, when he had a mind to exercise himself and his *horses*.

It appears, likewise, from Pausanias, that there were *horse-courses* even in the time of Hercules, the indicator of the Olympic games.

It also appears, from the most ancient history extant, viz. the history of the Bible, that the *horse* was made subservient to the will of man in the earliest times, and therefore the use of this animal is probably almost coeval with mankind. See Gen. ch. xlii. 17. Job xxxix. 13, 19. Gen. i. 9. Exodus xiv. 9.

From the two last cited passages, in which chariots and horsemen are named together, it appears probable, that the use of chariots and the art of riding were introduced about the same time, the latter being a little prior to the former; and Egypt seems to have been the country to which mankind are indebted for the equestrian art, though the precise period of time, in which it was at first practised, cannot be easily ascertained. From hence it was conveyed to the Ethiopians, Arabs, Indians, Persians,

Parthians, Armenians, Scythians, &c. The colonies which came from Phœnicia in Egypt, brought this art with them, and established it in Greece, and with the art, transplanted thither the *horse*, which was not originally a native of Greece. The Thessalian *horses* were the most famous of ancient Greece, and valued and admired not only by the inhabitants of that country, but by the most judicious and experienced of other nations. From Greece the art of horsemanship was transmitted to the Romans, who cultivated it with such diligence and zeal, that they were soon able to excel their masters.

It was the custom among the ancients to impress some mark on their *horses*; the most common were, a *S*, *figma*, a *K*, *lappa*, and bullock's head. Hence those marked with *S* were called *Saurosai*, those with a *K*, *Karravani*; and those with a bull's head, *Bouphani*, *Bouphali*. It is, however, more probable, that the famous *horse* Bocephalus owed his appellation to the resemblance which his head bore to that of a bull, and not to the impression of one which was burnt into his flesh, and was a mark in no wise peculiar to him, but common to all *horses*, so that he could not have been particularly distinguished by it. And Anlus Gellius, lib. v. cap. vi. expressly tells us, that this was the fact; and that the head exactly resembled, in shape and figure, the head of a bull: "This mark was stamped on the *horse's* buttocks and his hams; as appears from the scholiast in Aristophanes' *Cleulus*, *Hephæstus*, &c."

In modern times, Arabia is most distinguished for the excellence of its *horses*, and the address of its inhabitants in riding them.

The Arabians breed their *horses* for sale, and there is a considerable revenue arising from those that are sent out of the country, the tax being about 10*l.* sterling for each *horse*. The people are scrupulously exact in preserving the pedigree of their *horses* for several ages; so that they know their parentage, alliances, and genealogy, distinguishing each breed by different appellations, and dividing the whole kind into three classes. The first class is called *ahab*, being the most pure and ancient, without any mixture, on the side of the *mare* or *dam*. The second class is composed of *horses*, whose race, though ancient, has been mixed with Arabian blood, either on the male or female side, which, nevertheless, is deemed noble, but misalled. The last class comprehends the common *horses*, which are sold at a low price; but the two former sorts are extremely dear, the lowest-priced mares of the first class being worth five hundred French crowns, and some fetching even four, five, or six thousand lives.

When a stallion covers a mare among the Arabs, both being of equal quality, witnesses are called to be present on the occasion, who sign a certificate in the presence of a magistrate, in which the names of the horse and mare are mentioned, with their pedigrees. When the mare drops her foal, witnesses are called again, and another certificate is drawn up and signed; and those vouchers are given with the animal, like the deeds of an estate when it is sold.

The Arabian *horses* are generally of a middling size, neat and clean in their shape and limbs, and of a thin and slender figure. Their keepers curvy and feed them morning and evening, and only let them drink two or three times in the day. About March, when the grass is strong and plentiful, they fold them, and devote this season likewise to procreation; observing the custom, which we have probably derived from them, of throwing cold water upon the mare as soon as the stallion descends from her back. When the spring is past, the *horses* are taken from the pastures, and kept for the rest of the year without grass or hay, solely upon barley, with a certain portion of straw. When the colts are about eighteen months old, they shear the hair of their tails, in order to make it grow thicker and stronger. They begin to ride their colts at the age of two years, or two and a half at most.

The best breeds of this country are said to be sprung from the wild horses of the *Desert*, of which, many ages ago, a stud was composed, which increased the breed, and furnished Europe, Asia, and Africa, with these noble animals. The best *horses* are, therefore, immediately or remotely descended from Arabs, descended from Arabians, whose climate is peculiarly favourable to the breed of *horses*.

The Arabian breed is propagated in Barbary, among the Moors, and even among the Negroes, on the banks of Gambia and Senegal, where they are fed with Indian corn, bruised and mixed with milk. Egypt, Turkey, and Persia, are supplied with *horses* from Arabia. The Barbary *horses* are to be found in most countries of Europe.

The foreheads of these *horses* are generally long, slender, and

and ill furnished with mane, but rising distantly, and boldly out of their withers; their heads lean and small, and resembling that of a sheep; the ears handsome and well placed; the shoulders light, sloping backwards, and flat; their withers fine, and standing high; loins, short and strait; flanks and ribs round and full, without having too large a barrel; their haunches strong and elastic; the croupe often somewhat too long; the tail placed high; thighs well turned and rounded; legs clean, well made, and thin of hair; the sinews detached from the bone, but the pastern generally too long and bending; the foot good and found. These *barbs* are of all colours; but the most common sort is grey; they are generally cold and slow in their pace, and require to be roared and animated by the rider, when they will discover a great fund of vigour, wind, and speed. They are very light and nimble, formed for running, and are much valued in their country than for their own merit, being thought, when transported into foreign countries, to get colts which excel their sire in good qualities, on which account they are valuable finders.

The Algerines are said not to like to castrate their *barbs*, but only guesse their testicles when they are about three months old, and thus render them incapable of propagation.

It is thought that the *barbs* of the kingdom of Morocco are the best, and next to them a breed called the mountain *Barbs*, which are fore-fetted, of a gentle disposition, and very attentive and docile. Their walk is free and bold, and their gallop very rapid.

In Turkey, Arabia, and Persia, they expose the dang of their *barbs* in the sun, and when it is capable of being finely powdered, they spread it under them instead of litter, which gives their coat a beautiful gloss and lustre. The Persian *barbs* are reckoned next in value to those of the Arabians. The Spanish *barbs* are much commended; some make them second to the Arabians, and place them before the Barb. Holland furnishes a race of *barbs*, which are principally serviceable in the coach; the best come from Friesland. France abounds in *barbs* of all kinds, but by no means excels. The best of those fit for the saddle come from Limousin; and next to those, Normandy claims precedence, for its handiness, generous, and useful breed. The French *barbs* are apt to have their shoulders too loose and open, as those of the Barb are too confined and strow.

The finer and better sort of the more modern English hories are descended from Arabians and Barbs, and frequently resemble their sires in looks and appearance; but differ from them considerably in size and mould, being more furnished, stout, and lusty. In general, they are strong, nimble, of good courage, capable of enduring much fatigue, and both in perseverance and speed surpass all *barbs* in the world. However, it is objected to English *barbs*, that they want grace or expression in their figure and carriage; that they are oblique and fullen; that they have stiff shoulders, and want suppleness in their limbs, which render them unfit for the manege. England has at all times, even in its rudest state, been possessed of a breed of *barbs* sufficient to answer every necessary purpose. But it is probable, that those now used in the service of war, as well as for draught, are an offspring of the German or Flemish breed, meliorated by our soil, and a judicious culture; as our race *barbs* derive their origin from Arabia. The venerable Bede says, that the English began to use saddle-*barbs* about the year 631, when prelates and nobles rode on *barbs*; and who till that time were accustomed to walk. In the reign of Athelstan the English became so jealous of their *barbs*, which were also held in high esteem by foreigners, that a law was made by that monarch to prohibit the exportation of them, unless they were designed for presents; and in the reign of this prince many foreign *barbs* were introduced into this kingdom. The variety of breeds in this island was further augmented by William the Conqueror, and particularly by Roger de Belesme, earl of Shrewsbury, in his time, who introduced the Spanish Italians into his estate in Powis Land, from which that part of Wales was for many years celebrated for a swift and generous race of *barbs*. See on this subject Berenger's History and Art of Horsemanship, vol. i. passim; and Pennant's British Zoology, vol. i. p. 1, &c. The importation and breed of *barbs* were much promoted by Edward II. and Edward III. Polydore Virgil informs us, that in the reign of Henry VII. the English were wont to keep large herds of *barbs* in their pastures and common fields; and by 11 Hen. VII. cap. 13. it was prohibited to convey *barbs* out of the realm without the king's licence, on pain of forfeiture. In the reign of the succeeding prince, a particular regard was paid to the raising of a breed of good and strong *barbs*; and accordingly several laws were made, enjoining those

who had parks, inclosures, &c. to keep at least two brood mares, of a certain size, &c. and prohibiting stoned *barbs* from being put into forests or commons where mares were kept, within certain counties, which were above the age of two years, but not fifteen hands high, on pain of forfeiture; and stoned *barbs* from being kept in such places, on pain of 10s. 22 Hen. VIII. cap. 6. 22 Hen. VIII. cap. 13.

By 1 Ed. VI. cap. 18, & 2 & 3 Ed. VI. cap. 33. *barbs* are excluded from the benefit of clergy. By these prudent and judicious measures, the English breed of *barbs* was not only improved in strength and size, but also greatly increased in numbers. Till the use of coaches was introduced in the reign of queen Elizabeth, saddle-*barbs* and carts were the only methods of conveyance for all sorts of people; and the queen rode herself her mules of the *barbs*, when she went in state to St. Paul's. By the 1 and 2 Ph. & M. cap. 7, and 31 Eliz. cap. 27, it is enacted, in order to prevent *barbs* from being stolen or sold in private places, that owners of fairs and markets shall appoint toll-takers or book-keepers, who are to enter the names of buyers and sellers of *barbs*, &c. And to alter the property, the *barbs* must be rid or stand in the open fair one hour; and all the parties to the contract must be present with the *barbs*. Sellers of *barbs* are to procure vouchers of the sale; and the names of the buyer, seller, and voucher, price of the *barbs*, the colour, and one special mark at least, are to be entered in the toll-taker's book, and a note of the same delivered to the buyer; and if any person shall sell a *barb*, without being known to the book-keeper, or bringing a voucher; or if any one shall vend, without knowing the seller, or the book-keeper shall make an entry, without knowing either; in each of these cases the sale is void, and a forfeiture is incurred of 5s. The owner may seize and take his *barb* again, or have an action of detinue, &c. A stolen *barb*, though sold according to the direction of the act, may be redeemed and taken by the owner within six months, repaying the buyer what he shall swear he gave for the same. Any person killing a *barb* in the night-time is guilty of felony, and liable to transportation for seven years; and inducing a *barb* incurs the penalty of treble damages. 22 & 23 Car. II. cap. 7.

Barbs in hackney-coaches are to be fourteen hands high. 4 Anne, cap. 23. If hired *barbs* are abused by immoderate riding, &c. there lies an action of trespass on the case.

British *barbs*, mares, and geldings, pay on exportation a duty of 5s. each.

The parts of a *barb's* body furnish a great variety of terms, by no means to be overlooked. The skin and coat are called the *hair*; the long hair on the neck, the *mane*; the *fore-top*, the *top* or *tail*; the hair behind, on the neck, the *fore-lock* or *fore-top*; that growing over the top of the head, the *crest*, or *crown*; that on the eyelids, the *brill*. The edge whereon the mane grows, is called the *crest* or *crest*; the fore-part, from the neck to the fore-legs, the *brisk* or *brisk*; the mark frequently running down his face, the *racine*; and that in the forehead, the *star*. The top of the shoulder-blades, at the setting of the neck, is called the *withers*; the place where the saddle is set, the *back*; and a bruise or hurt thereon, a *navel-pain*; the middle of the back, from the mane to the hips, the *reins*; the extremity of the reins above the hips, the *croupe*; the tail, the *tail* or *tail*; the hollow or bending of the back-bone, the *seam*; the hind part of the belly, next the genital, the *flank*; that nearer the thighs, the *grain*; the loose skin wherein the yard is, the *sheath*; and the fore parts of the shoulders, next the breasts, the *scapula*. The uppermost part of the hind-leg, next the buttock, is called the *huckle* or *huckle*; the after-joint, or bending of the hind-leg, the *chamber* or *elbow*; the inner, the *ham* or *hough*; the joint at the fetlock, the *postern* and *setback*; the foot, above the hoof of the ankle-joint, the *coronet*. The part from the withers to the top joint of the thigh, is called the *shoulder*; the middle joint of the fore-leg, the *hock*; the right-leg, before, the *fore-leg*; and the left, the *hind-leg*. The hoof is called the *horn*; the hollow of the hoof, the *effem*; the tender part of the hoof, next the heel, the *frog*; the ball of the hoof, the *frog*; the part to be pared or cut off the hoof, when overgrown, the *hoof* or *hoof*; the part of the hoof, the *hoof*; the part, where there is a rising in the middle of the sole, the *heel*; and the inflex meeting on the heel, the *quarter*. Of most of these a farther account will be found under the respective articles.

The matters of this art lay it down, that a *barb*, to be good and well-made, must have three parts like those of a woman; viz. the breast, which is to be broad, the hips round, and the mane long; three of a lion, viz.

countenance, intrepidity, and fire; three of a bullock, viz. the eye, nostril, and joint; three of a sheep, viz. the nose, gentleness, and patience; three of a mule, strength, constancy, and foot; three of a deer, head, legs, and hair; three of a wolf, throat, neck, and hearing; three of a fox, ear, tail, and trot; three of a serpent, memory, fight, and turning; three of a hare or cat, cunning, walking, and fappleness.

Horses are distinguished into divers kinds, and are differently denominated, with regard to their brain or country. (As the Neapolitan, known by his hawk nose; the Spanish *potro*, by his small limbs; the Dutch, by his fine head and deep hoof; the Dutch, by the roughness of his legs; the English by a strong knitting together, &c. the Flandrin, &c.)

Horses are also distinguished, with regard to the uses or offices they are reserved for; as the *coach-horse*, *war-horse*, *hunting-horse*, *running-horse*, *post-horse*, &c.

Horses are also distinguished with regard to their colours; as a *bay*, which admits of divers shades or casts; viz. a black-bay, brown-bay, dapple-bay; all which have constantly black manes and tails. *Dun* and *mouse-dun*, having frequently a black list along the back, which denominates them *black-bitted*. *Blue-bitten*, which is white spotted with red. *Grey*, dapple-grey, silver-grey, fad or powdered grey, black-grey, branded-grey, landy-grey, and iron-grey. *Grizzle* or *ruant*, a light flesh-colour intermixed with white. *Peach-colour* or *blissum colour*.

Foalish, which consists of two colours, one of them white. *Road*, a bay, black, or fawn, intermixed with white hairs. *Redskin*, black or fawn, with a few white hairs scattered about his body. *Sorrel*, common sorrel, red or rose-coloured sorrel; bright, or light-coloured sorrel, burnt sorrel; all chiefly distinguished by the colour of their mane. *Starling-colour*, resembling a brownish or blackish grey, only more freckled, or intermixed with white. *Tiger-colour*, much the same with the branded grey, only the spots smaller. *Walrus-colour*, *dar-colour*, *black*, *white*, &c.

These colours are generally considered as symbolical of the nature, qualities, &c. of the beasts; and accordingly their value is much influenced hereby. The dapple-grey is prized for beauty; the brown-bay for service; the black, with silver hair, for courage; the roan for countenance; the sorrel, black without white, and iron-grey, are reputed hot and fiery; the bright-grey, flea-bitten, and black with white spots, are languine; the white, dun, and pre-bald, phlegmatic and heavy; the mouse-dun, red-bay, and blue-grey, are dull; the peach-colour rarely prove obedient to the spur; the sorrel seldom fail of being good, especially if their legs, tails, and manes, be black; and the same may be said of the flea-bitten, or least these be marked in the fore parts, or over the whole body; for, when only behind, it is an ill sign. Indeed, it is hard to lay down any universal rules in this case. The white, which promise the least, often prove good, when black about the eyes and nostrils; and there are excellent iron-greys, though that is not reputed a good colour.

The common marks of a dull, stupid horse, are white spots round the eye, and on the tip of the nose, upon any general colour whatever. Though the vulgar take these spots for signs of stupidity, yet it is certain they are marks of the goodness of a horse; and such horses as have them, are very sensible and quick upon the spur.

The French call these spots *marques de laide*. Our dealers in horses use the term *mettled horse* to express a creature of that species which has a great deal of vigour and heart, as they call it. Otherwise there is a great difference between a *mettled horse*, a *horse of vigour*, and a *fiery horse*; but as this is not sufficiently attended to by gentlemen in their purchases of this animal, some general rules for the distinguishing real vigour in a horse, may be acceptable in a work of this general kind.

When a horse is standing still, the rider who has a mind to try whether he has vigour in him, should keep him fast with the bridle-hand, and apply the spurs to the hair of his sides; this is called by horsemen pinching. If the horse is impatient under this, gathering himself up, and endeavouring to go forwards, and champs upon the bit, without thrusting out his nose, it is a sign of vigour and right mettle in him. Some caution is to be used, however, in judging by this, to distinguish between a horse that has vigour really in him, and one that has only a fine skin, and is rather ticklish than mettled. This is the case with a great many horses, and is found by their being very sensible of the touch of the spur, and shewing the appearance of a great deal of mettle and vigour when touched, but immediately losing the apprehension of it. These are of a dull disposition, but only have a tender skin.

The *mettled horse* is to be highly valued, but the *fiery one* is good for nothing; a horse that is truly vigorous should be calm and cool; he should in general move on patiently, and only shew his mettle when it is required of him. The safest method is to choose such horses as are extremely apprehensive of strokes, and are afraid at the least appearance of their coming. These, at the only closing of the legs and thighs, seem to be seized with fear, and alarmed, but without fretting or fierceness. A horse that walks deliberately and securely, and that, without requiring the whip too often, will go on briskly and without fretting, will go from the walk to the gallop, and as easily from the gallop to the walk again, and continually champs upon the bit, and trots with glibness, upon the shoulders easily, and snorting a little through his nostrils: this is generally a creature of true mettle and vigour, though it does not rise to such a fierceness as is troublesome or dangerous. If to these good qualities a horse be well upon his haunches, and have a light and easy stop, his head well placed and firm, and the setting of his bit equal and just, the gentleman who loves riding will seldom need to complain of the price. All the good qualities of a horse should, however, never recommend him, unless he has a good mouth, and a sensible obedience to the spur.

Horses, for the age, teeth, &c. cf. see AGE, HEIGHT, &c.

Horses, airing of a. See AIRING.

Horses, backing of. The first backing of a horse is a thing of great consequence, as his value afterwards very much depends on it. After a colt has been exercised some time, morning and evening, and becomes somewhat obedient, he is to be taken to some ploughed land, the lighter the better; he must be made to trot over there in the hand, by that means to tire him and abate his wantonness. When this is done, care must be taken that all the tackling be good and firm, and every thing in its due and proper place; then a person is to hold his head, and another to mount him; but this must not be done suddenly, or at a jerk, but very gradually and slowly, by several half ridings and heavings. If he bears this patiently, the person is to seat himself firmly on his back; but if he be troublesome, and not tamed enough, the person is to forbear the attempt to mount, and he is to be trotted hard in the hand over the same ploughed lands again, till he is willing to receive the rider quietly on his back. When this is done, the person who is on his back must cherish him, and the man who has his head must lead him a few paces forward; then he is to be cherished again. The feet are to be fitted well in the stirrups, and the toes turned out; afterwards the rider is to shrink and move himself in the saddle, and the person who holds his head, is to withdraw his hand a little farther from the mouth. As the rider moves his toes forward, the holder must move him forward with the rein, till he is made to apprehend the rider's motion of body and foot, which must always go together, and with spirit, and will go forward without the other's assistance, and stay upon the restraint of the rider's hands.

When this is accomplished, let him be cherished, and have grass and bread to eat; and then let the rider mount and alight several times, cherishing him between each time; and thus he is to be managed till he will go on, or stand still at pleasure. This being done, the long reins may be laid aside, and the band about the neck, which are always used on this occasion, and nothing will be necessary but the traces and cavesson, with the martingal. A groom must lead the way before; or another horse going only straight forward, and making him stand still when desired. In this manner, by sometimes following, and sometimes going before another horse on the trot, the creature will by degrees be brought to know that it is his business to be quiet and governable. See FOAL.

Horses, breeding of. In order to have a good and beautiful race of horses, it is necessary to choose for a stallion a fine barb, free from hereditary infirmities; such as weak eyes, bad feet, spavins, purfles, or the like. Disorders that arise from accidents are of no consequence: nor is the horse to be at all the less valued for them as a stallion. Three months before this horse is to cover a mare, he should be fed with sound oats, pease, or beans, or with coarse bread, and a little hay, but a good quantity of wheat straw; he should be led out twice a day to water all this time, and after every watering walked about an hour, but not over-heated. If he be not prepared and put in heart in this manner, the colts will be weakly, and the horse himself will be spoiled, growing purty and broken-winded.

If he is put to too many mares, he will not last long; his main and tail will begin to fall off through weakness, and it will be difficult to get up his flesh again by the next year. The number of mares should be proportioned to his

his strength, and twelve, fifteen, or at the most twenty, are as many as a horse will well serve for in a season. Mares go with foal eleven months, and as many days over as they are years old. This being certainly known, it is easy to contrive so that all the foals may be brought forth at a time when there is plenty of grass. About the end of May the mares are to be put into an inclosure capable of feeding them as long as the stallion is to be with them, or that they are in season. In this inclosure all the mares are to be put together, as well those which are barren as others. The stallion's hind-shoe is to be taken off, but the fore-shoes should be left on to preserve his feet; then lead him forth, and let him cover a mare twice in hand, to render him more tame and gentle. After this take off the bridle, and turn him loose among the rest, where he will become familiar with them, and not one of them will be horrid but when they are in season. There should be a little lodge built up in some part of the inclosure; and peas, beans, oats, bread, and other good food, put into the manger in it, that the horse may retire into it in the scorching heats, and eat what he likes best. He must be thus entertained during the whole time he is with the mares, which is to be about six or seven weeks.

Mares that are very fat and gross do not hold well, but those which are moderately fat conceive with the greatest success and ease. To bring a mare in season, it is a common thing to give her a quart of hempseed, or twice that quantity, night and morning, for eight days before she is brought to the horse. If she refuse it alone, it may be mixed with beams of oats, and will go down; and if the stallion eat of it also, it will make him the better.

The stallion should not cover before he is six years old, nor after he is fifteen. A mare should never be covered before she is three years old; they should be always found neat and healthy, and of a good breed; such as these will bring forth better and later foals than any others. The colts produced from these, are not to be used for stallions; for they will degenerate, and the race will soon become exactly our own country breed. If a barb is not to be had, a Spanish horse is to be chosen. See MARE.

HORSES, diseases of. See BOTTS, CONSUMPTION, COUGHS, FEVER, GRIPES, HORSE-BOUN, &c.

The horse is likewise in some cases subject to the stone.

HORSES, eyes of. See EYES of horse.

HORSES, fattening of. The thing able to do this speedily is one of the greatest arts our dealers have, and indeed one of the greatest niceties in the whole management of these animals. Many methods have been prescribed; but the following seems most to be depended on: take elecampane, cummin-seed, tamarisk, and aniseed, of each two ounces; common groundell, one handful; boil all these very well, with two handfuls of galls, scraped and cleaned, in a gallon of good ale; strain the liquor well off, and give the horse a quart of it every morning made hot; keep him warm after it. He may be taken this for four or five mornings, he may be returned out to grass, or kept in the stable, as the season will permit. But whenever provender is given him, a quantity of powder is to be prepared of equal parts of cummin-seeds and elecampane, and give him half an ounce of it every time, sprinkling it in by degrees as he eats, that he may not nauseate the whole.

If this method does not succeed in a short time, then take two spoonfuls of diapente; brew it in a pint of sweet wine, and give it the horse for three mornings. This will take off any inward sickness, and make the other things take effect. After this feed him with good provender three times a day; that is, after his watering in the morning, after his watering in the evening, and at nine o'clock at night. If he does not eat the provender well and freely, it must be changed for some other kind. If all this does not succeed, let the horse be bled; and then take half a bushel of coarse barley meal, put it into a pail-full of water, and stir the whole together very well; then let it settle by standing. Pour off the clear liquor into another vessel, and let him drink it for his common drink, and eat the remainder, which falls to the bottom of the pail. If he refuse to eat this alone, there may be some bran mixed among it. This should be given him three times a day, morning, noon, and night. If he does not rightly take to the meal with the bran, some oats must be mixed with it, and this will readily bring him to feed on it. But which ever way is used, they must be by degrees diminished in quantity, till at length he is brought to eat the meal alone; for that is the thing that will fatten him up. Care must be taken that the barley is ground fresh every day as it is used, for it quickly grows rancid; and when this has once been the case with one parcel, no art will ever bring the horse to touch any of it afterwards. Scarce any horse but will be well fattened by keeping him to this diet for about twenty days.

Barley ground in this manner cools and purges the creature; but the greatest efficacy, as to the fattening him, lies in the water, which by this management takes up all the rich part of the barley into itself. When the horse grows lumpy on this diet, it must be taken from him by degrees, giving him at first oats once, and barley-meal twice a day; and then oats twice, and the barley-meal once, till he is perfectly weaned from it. In the mean time he must have good hay; and he must not be rid; only it will be proper to walk him gently about an hour or two in the heat of the day. If it is found that the horse wants a good smart purging during the time of his continuing in the barley-diet, the best time to give him is after the first eight days, and the following is a very proper sort of physic: take of the finest ales one ounce, agaric in powder, half an ounce; and powder of Florence orris, one ounce: let all these be mixed together, and put into a quart of milk, warm from the cow. This will work very briskly; and after it is over, the usual diet is to be continued. If horses of value were to be kept to this diet once a year, it would make them less hot and dry, and not subject to many diseases, which they are troubled with at present, and would be particularly useful after campaigns and long journeys. If the horse loses his appetite by this diet, it will be proper to tie a chewing-ball to his bit, renewing it so often, till at length he begins to feed heartily on the barley; for these balls at once restore appetite, and are themselves of a fattening nature. See CHEWING-BALL.

HORSES on a journey, management of a. The common method of travelling in England being on horseback, it may be proper to give some general rules for keeping the creature sound, and doing the business generally, without many of the accidents which usually attend it.

Care must be taken that the shoes be not too tight, and do not pinch the horse's feet any way; but be well shaped, and set easy. It is proper to have them put on six or seven days before the journey, that they may last well, and that they may be fitted to the feet before the setting out. The bridle is next to be examined; that the bit of it be proper, and not too heavy; for if it be, it will incline him to carry low when he grows tired, and rest upon the rider's hand: this is what they call the using a high leg. It is a very disagreeable thing, but may often be avoided, only by taking a proper care of the bit. The mouth of the bit should rest upon his bars, about a finger's breadth from his tushes, so as not to make his lips uneasy. The curb should rest in the hollow of his head, a little above the chin; and if it galls him, the place must be defended with a piece of buff or other sort of leather.

The seat time to be regarded, is the fiddle; and proper care must be taken as to this, that it do not rest either upon the withers, reins, or back-bone; and that one part of it do not press upon the back, any more than another. Some riders gill a horse's sides below the fiddle with their stirrup-leathers. This is most likely to happen to a lean horse; and to prevent it a leather strap should be fixed between the points of the fore and hinder bands of the fiddle, and the stirrup-leathers should be made to pass over these leathers.

It is always best to begin a long journey by short stages; and this is the more necessary, if the horse has not been exercised for some time before. If he is a horse that is rid, he should be suffered to take as often as he likes, and even invited to it; but, if a mare, she is to be less indulged in it as less necessary, and often diminishing her strength. It is always advisable to ride very softly for a quarter of an hour, or half an hour before coming in to the inn at night, that he may not be over-hot when put into the stable; but if the halter of the journey will not admit of this, the horse should be walked in some person's hands, to cool him gently before he is put up.

If the weather is cold, a cloth should be laid over him while he is walked; and when taken in, his whole body should be rubbed and dried with straw. Some have a custom of ordering their horse's legs to be rubbed well down, on their first coming in; but this is very prejudicial while the horse is hot, and should always be left alone till he is perfectly cooled.

As soon as the horse is cooled, and ceases to heat in the flank, the bridle is to be taken off, the bit withheld, and his given him, that he may eat at pleasure. The dole in very dry weather will sometimes clog up the tongue of the horse in such a manner, that he cannot eat without great difficulty; in this case some bran and water should be first given him to wash his mouth, or the servant should do it with a wetted sponge.

These are the proper methods, when the horse has been rode moderately; but when he has been hurried at a great rate, the fiddle is to be taken off as soon as he is put up, and the sweat rubbed off with a wet-knife; and then the whole body and legs are to be rubbed carefully down, and the head is to be wiped with a cloth, as also the

back under the saddle, and the thighs; then the fetlocks should be clapped on again, and the horse gently led up and down, till cool and dry. The feet are also to be examined, to see if a stone be warring, or if any of them puffs upon the sole; and the dirt, gravel, or other foulness, is to be picked out from between the shoe and the foot. The openings of the feet may be stopped with cow-dung, and the hoofs, if brittle, should be anointed with some fatty substance till the setting on; and in dry weather they should be greased, not only at night, but noon. Many horses, as soon as unbridled, will lay themselves down, instead of eating.

Many are apt on this to suppose the horse sick; but it is generally owing only to the heat and pain they find in their feet, which renders them unable to stand upon them. In this case, if their eyes are examined, they will be found bright and good; and the hay being offered them as they lie, they will eat it greedily. This shows there is no inward disorder, and the heat and tenderness of the feet, if examined, will show that they are the part in pain. The principal thing to be done in this case, is taking care that the shoes do not rest upon the soles. This is not easily known, but by taking off the shoes, which in cases of extremity should always be done; it will then be found where the soles are touched by the shoe, being in that part more smooth and shining than elsewhere. In this case the feet are to be pared in those parts, and then the shoes are to be fixed on again, mending the hoofs, and stopping the soles with hot blaes pitch or tar.

These are the means by which travelling will be rendered easy and commodious both to the rider and the horse; but there is some care also to be taken of the creature, after he comes off from a long journey. The first thing to be done is, to draw the two heel-nails of the forefeet, and if the shoe be large, then four should be drawn; two or three days after the horse should be blooded, and for ten or twelve days after this, he should be fed with wet bran, without any oats; but he is to be kept well lined. All the reason of drawing the heel-nails is, that the feet are not to swell after journeying; and if this is not done, the shoes press upon them in that part, and become very uneasy to them. It is advisable to stop them also with cow-dung or some time; but they are in this way on who pare them down after taking off the shoes, for the humours being all in motion after this, they are apt to fall into the feet.

If there appear any danger of the creature being swelled after the journey, it may be easily prevented by this means: take a quantity of the dung of an ox or cow fresh made; mix it with so much vinegar as will reduce it to a soft pulpy, and add to it a handful of salt; with this rub all the hips thoroughly up to the knees, and let it dry only give the water in a pail that evening, that the legs may not be wetted, and the next morning the horse is to be led to water, and the whole remaining matter washed off. The jockies have a very cunning trick to recover the hoofs of a horse injured by a long journey: they make a hole in the foot, and fill it with moistened cow-dung; they keep this in it a month, and the continual moisture occasioned by it makes the hoof grow very quick, and soon recover the proper dimension; but it soon after decays and shrinks so, that the foot is straightened, and the whole hoof becomes brittle.

Cow-dung applied to a horse's foot always moistens the sole; but it dries up the hoof, if continued any length of time to it. The best method of recovering a horse's hoofs is to make a hole in the stable floor, filled with blue clay a little wetted; in this the horse should keep his forefeet a month; this will have more effect than a small portion of cow-dung in the foot; and the effect will be of so different a nature, that the hoof will be rendered more tough than before, instead of being made brittle by it.

Most horses that are fatigued, or overworked by long journeys, have their flanks altered by it, without being purged; especially horses naturally vigorous, which have been worked too violently. The best remedy in this case, is to give the horse half a pound of honey in the morning, mixed among a feed of scalded bran; if he eats the half pound readily, give him a pound the next morning; continue this till the honey causes to purge the creature; after this, powder of liquorice may be added to the scalded bran, and this continued some time, and two or three glysters at convenient distances of time will be found very serviceable. If the horse be very lean, it will be proper to give him some wet bran over and above his proportion of oats; and gruel is also very proper, if the creature be not inclined to be purged. This caution, however, is to be had at all times, that excessive feeding may be had, by subjecting the horse to the farcy. When the horse begins to drink heartily, it is a sign that he will soon

recover. Though this sometimes fails, it is a good general rule.

When a horse comes tired into a stable, fresh litter has the virtue always to occasion him immediately to stale. This is known to be a very great advantage to a horse in a tired state; and when the litter is old and dirty, it never has any such effect upon him. If the owners knew how refreshing it is to a horse to discharge his urine on his return from labour, they would be more careful in giving him all means and occasions of it than they are. This staling after fatigue prevents those obstructions in the neck of the bladder or urinary passages, which horses are too subject to; the bladder being often inflamed by the long retention of the heated urine in it, and the creature perspiring by it. Some of our farmers do wrong in this case of the litter, not through carelessness or accident, but by principle; they order the old litter to be left a long time in the stables, that it may be impregnated with more and more of the urine, &c. of the animal, and be made softer for the fields. It is not to be doubted but the manner is greatly improved by this; but the damage done to the horse by it is greatly over-proportioned to its benefit. The best which the dung acquires, by thus lying together, spoils the feet of the creature, and makes it unfit for any service, and occasions many distempers, which are ignorantly continued and increased by the continual staling of heat in the fermenting dung, till at length the horse perishes.

Those who have any concern with horses know, that it is sometimes very difficult to make them lie down in the stable. The following simple method is proposed for this purpose by a noted dealer. When you have a mind to make him lie down, take a piece of strong packthread, or laycord, and tie it as tight round the horse's tail as possible, without breaking the skin, and as near as you can to the rump-bone: this will give him a pain in the back, and he will be glad to change his posture, to get ease; and when he finds he cannot in any other way procure it, he will lie down, which he will find the most easy posture, and he will of course take a liking to it.

Horses, entering of. Whilst a person is on a journey, the horse should always be suffered to drink of the first good water he comes to after seven o'clock in the morning in summer, and after nine or ten in the winter. Moderately pure water is to be preferred, that being best of all which is neither too clear nor penetrating, nor muddy and stinking.

Though it is the custom in England to run and gallop horses after drinking, which we call *watering-couriers*, and which we suppose brings them into wind, yet Sollyf, and many other of the best judges of horses, tell us, that it is one of the worst and most pernicious practices that we can be guilty of; no good can accrue from it, and many horses are rendered purty by it.

While a horse is drinking, the rider should draw up his head five or six times, making him move a little between every draught. The rider need not be afraid of giving him water, with proper moderation, even in almost any circumstances. If he be warm and sweat very much, yet if he is not quite out of breath, and there are four or five miles to ride, he will be better after drinking a little, than if he had drunk none at all; only observing, that if the horse were very warm at his going into the water, his pace must not be less than a moderate trot when he comes out, that he may not be chilled.

In the time of a journey the horse ought to be suffered to drink in this manner of the waters that come in the way, so often as may be; for if the rider happens to bait when he is hot and sweaty, he must not be suffered to drink for a long time, as it would endanger his life; and if he has not been watered in this manner on the road, his excessive thirst will often prevent his eating, and he will not be able to touch any sort of food for an hour or two, which is usually more time than the rider can stay; and yet without eating at baiting times, he will not have strength to go on. The giving him water on the road will, on the contrary, keep him ready for food whenever it is offered him, and the rider need stay no longer than his own refreshment requires, the horse eating immediately, and being readily qualified to go on again.

If there be any shallow water in the way, a little before the cooling to the inn where the horse is to rest all night, it is always proper to ride him in, and not only give him a little drink, but ride him about several times, not quite up to the belly; this will clean his legs, and prevent humours from falling down into them. If the horse be very warm, and there has been no convenience of watering him upon the road, the oats that are given him should be first steeped a while in ale; this will induce him to eat, though he could not have touched any that were wholly dry.

Many are of opinion, that horses are sometimes spoiled by

by giving them oats before their water; but Mr. Sollyfel asserts, that though it be not the custom to give oats till afterwards, yet it never does any harm to feed the horse with them both before and after drinking; and that it is often proper and necessary, especially when the horse has been hard rid, and is warm.

HORSE, Draught, in Farming. A sort of coarse-made horse defined for the service of the cart or plough. In the choice of these horses for what is called the *flax draught*, they are to be chosen of an ordinary height, for otherwise when put into the cart one draws unequally with the other. The draught-horse should be large-bodied and strong-jointed, and of such a disposition, as rather to be too dull than too brisk, and rather to exert the whip than to draw more than is needful. Mares are the fittest for this use for the farmer, as they will be kept cheap, and not only do the work, but be kept breeding, and give a yearly increase of a foal. They should have a good head, neck, breast, and shoulders for the rest of the shape, it is not of much consequence. Only, for breeding, the mare should have a large belly; for the mare soon a foal has in the dam, the better proportioned it will be. Draught-horses should be always kept to that employ. Some put them to the saddle on occasion, but it does them great harm, alters their pace, and spoils them for labour. The draught-horse ought to have a large broad head, because horses of this shaped head are less subject than others to diseases of the eyes. The ears should be small, straight and upright; the nostrils large and open, that he may breathe with the more freedom. A horse with a full and bold eye always promises well. On the other hand, a sunk eye and an elevated brow are bad signs. The horse is esteemed fittest for this purpose also, that has a large and round buttock, which neither sinks down nor cuts. He must have a firm and strong tail, and the dock must be thick and well furnished with hair, and placed neither very high nor very low. The legs should be rather flat and broad than round: the roundness of the leg being a fault in a horse destined to labour, that will soon ruin him. As to the hinner legs, the thighs should be fleshy and long, and the whole muscle which lies itself on the outside of the thigh should be large and very thick. No country can bring a parallel to the size and strength of our best horses destined for the draught. In London there are instances of single horses that are able to draw on a plain, for a small space, the weight of three tons, and which can with ease, and for coo insurance, draw half that weight. The pack horses of Yorkshire usually carry a burden of four hundred and twenty pounds, over the highest hills of the North, as well as the most level roads; but the most remarkable proof of the strength of our British horses is derived from that of our mill horses, some of which will at one load, carry thirteen measures, which at a moderate computation of seventy pounds each, will amount to nine hundred and ten pounds. Nothing is so essential to the health of these formidable creatures as cleanliness; if they are fed ever so well, and not kept clean, they will be subject to numerous diseases.

The servant who has the care of them ought to be up very early, and to clean the racks and mangers from all filth. The carrying of them ought to be carefully performed every morning, but not in the stable, for the dirt to fall upon the other horses, as it is too often done. After the horses are stabled, they should daily twist a whip of straw hard up, and wetting it in water, rub the legs, shoulders and body with it. Many of the diseases of draught-horses, which are not owing to raininess, are owing to bad water; such as are too raw, too muddy, or too cold, being all improper. If there be any running stream in the neighbourhood, they should always be led to that to water, every day in summer, but in winter, well-water is warm, and it is better for them. If there be a necessity of giving them well-water in summer, it must be drawn up some hours before the time, and exposed to the fire-beams in tubs or troughs; much water or that of lowland ditches is worst of all. When the labouring horse has drank his water, he should have his ears given him, and these should be carefully fitted, and the manger dished first. It is a common practice as soon as a horse is come in from his work, to rub down his legs with a hard whip of hay, but the best judges of horses absolutely condemn this, and observe, that this rubbing of the legs after hard labour, brings down humours into them, and makes them stiff.

The rubbing itself is wholesome, but the doing it when the creature is hot is the mischief; while a horse is in a sweat it is a great relief and refreshment to him to have his body rubbed down, but when he is cold is the proper time to rub his legs. The racks are to be well supplied with hay, and the horses should be left to rest and eat, about two hours, and then led to water, after this their

oats should be given them, and they should then go to work again.

In the evening when the labour of the day is over, the first thing to be done, is to examine the feet, and see if any thing is amiss about the shoes, and what earth or gravel is lodged in the foot, between the shoe and the sole, is to be picked out and some fresh cow-hung put in its place, which will cool and refresh the part.

A very material thing for the preservation of all sorts of cattle, but of none so much as draught-horses, is fresh and clean litter.

HORSE, Hunting. See HUNTER.

HORSE, Race. See RACING.

HORSE, Saddle. See SADDLE.

HORSE, War. The proper rules for choosing a horse for service in war, are these: he should be tall in stature, with a comely head, and out-swelling forehead; his eye should be bright and sparkling, and the white part of it covered by the eye brow. The ears should be small, thin, short, and pricking; or, if long, they should be movable with ease, and well set. The neck should be deep, and the breast large and swelling. The ribs bending, the chest broad and bright, and the buttocks round and full. The tail should be high and broad, neither too thick, nor too thin; the thigh swelling, the leg broad and flat, and the palfen floors. When such a horse is chosen, he must be kept high during the time of his teaching, that he may be full of vigour. His food must be sweet hay, and good clean oats, or two parts of oats, and one part of beans or peas, well dried and hardened. The quantity should be half a peck in the morning, and the same quantity at noon, and in the evening. Upon his resting days he is to be dressed between five and six in the morning, and watered at seven or eight. In the evening he is to be dressed at four, and watered about five, and he must always have provender given him after watering; he must be ltered about eight, and then must have food given him for all night.

The night before he is ridden, all his hay is to be taken away about nine o'clock, and he must have a handful or two of oats about four in the morning; when he has eaten these, he is to be turned upon the pasture, and rubbed very well with dry cloths; then saddled, and made fit for his exercise. When he has performed this, he is to be brought (wearing into the stable), and rubbed down with dry whips. When this has been done, the saddle is to be taken off, and he is to be rubbed down with dry cloths; the housing cloth is then to be laid on, and the saddle being again laid on, he is to be walked gently about till thoroughly cool. After this, he must stand without meat two or three hours, then he must be fed; and in the afternoon he is to be rubbed and dressed as before, and watered in the usual manner.

HORSE, Kent, in Zoology. See HIPPOCAMPUS.

HORSE, Sea. See HIPPOCAMPUS.

HORSE is also used, in the *Military Language*, to express the CAVALRY, or the body of soldiers who serve on horseback.

The horse includes horse guards, horse grenadiers, and two others. Dragoons are also frequently comprehended under this name, though they ride on foot; of these there are now eighteen regiments; besides three regiments of dragoon-guards, raised in 1685. See GRANADIERS, and DRAGOONS.

Horse guards, by the Spaniards called *guardia a cavallo*; by the French, *garde de corps*; by the English usually, *life-guards*; are the guards of the king's person and body.

Of these there are now two troops, raised in 1660: each troop has a colonel, two lieutenant-colonels, one cornet and major, one guidon and major, four exampis and captains, four brigadiers and lieutenants, one adjutant, four sub-brigadiers and cornets, and sixty private men. To which have been since added, by establishment, viz. in 1693 and 1702, two troops of *horse-grenadiers-guards*, each of which consists of a colonel, lieutenant-colonel, one guidon or major, three exampis and captains, three lieutenants, one adjutant, three cornets, and sixty private men; and the royal regiment of *horse guards*, raised in 1661. There are besides only four regiments of horse, which are quartered in Ireland.

The duty is, by parties from the guard, to attend the king's person when he goes out near home; an honour which has been lately appropriated to the *light-horse*. On state-days he is attended by detachments out of the *horse* and grenadier guards.

One of three captains of the *horse guards* attends on the king when he walks on foot, immediately next his person; carrying in his hand an ebony staff, or truncheon, with a gold head.

HORSE, Master of the. See MASTER of the horse.

HORSE.

HORSE, Light, are regiments of cavalry, mounted on light swift horses, whose men are small and lightly accoutred. They were first raised in 1757.

The denomination arose hence, that anciently they were lightly armed, in comparison of the royal guards, which were armed at all points.

HORSE, Hungarian. See HUNGARIAN.

HORSE is also a term used in various arts and manufactures, for something that helps to sustain their work from the ground, for the more commodious working at it.

The *horse* used by tanners and skinners, also called the *leg*, is a piece of wood cut hollow and roundish, four or five feet long, and placed aloft; upon which they pass their skins to get off the dirt, hair, &c.

HORSE is also used, in *Carpeting*, for a piece of wood jointed across two other perpendicular ones, to sustain the boards, planks, &c. which make bridges over small rivers; and on others other occasions.

HORSE, Little. See EQUUS MINOR.

HORSE, in *Sea-language*, is the name of a rope reaching from the middle of a yard to its extremity, or what is called the yard-arm, and depending about two or three feet under the yard, for the sailors to tread upon, whilst they are hoisting, reefing, or taring the sails, rigging out the shrouding-fall-booms, &c. In order, therefore, to keep the *horse* more parallel to the yard, it is usually fastened to it, at proper distances, by certain ropes called *stays*, which hang about two feet under the yard, having an eye in their lower ends through which the *horse* passes.

HORSE is also a thick rope, extended in a perpendicular direction near the fore or after-side of a mast, for the purpose of hoisting or extending some sail upon it. When it is fixed before a mast, it is calculated for the use of a fall called the square-fall, whole yard being attached to the *horse*, by means of a traveller or bull's eye, which slides up and down occasionally, is retained in a steady position: either when the sail is set, or whilst it is hoisting or lowering. When the *horse* is placed abaft or behind a mast, it is intended for the try-fall of a snow, and is accordingly very nicely fixed in this position, except in those loops of war which occasionally assume the form of snows; in order to deceive the enemy. Falconer's Mar. Dict.

HORSE is also a cast name introduced into the management of lotteries, for the chance or benefit of a ticket, or number for one or more days, upon condition, if it be drawn a prize within the time covenanted for, of returning to the seller an undrawn ticket.

To determine the value of a *horse*. Multiply the amount of the prizes in the lottery by the time the *horse* is hired for; and from the product subtract the amount of the number of prizes by the value of an undrawn ticket into the time of the *horse*: the remainder being divided by the number of tickets into the whole time of drawing, the quotient is the value of the *horse*. See LOTTERY.

HORSE BREAD. See BREAD.

HORSE-BREAD. Bread of a proper kind is often given to *horses* to hearten and strengthen them when they have gone through great fatigues, or are to prepare for such. Common household-bread will answer the purpose, but the more common way is to prepare a kind of bread on purpose. There are two different receipts for making this sort of bread, each of which has its admirers. The first method is this: take wheat-meal, oat-meal, and beans ground fine, of each half a peck; aniseed, two ounces; gentian and fennugreek-seed, of each an ounce; liquorice, two ounces; let all these be made into a fine powder, and sifted together, that they may be perfectly mixed: then add the whites of twenty new-laid eggs, and as much fine-salt as will knead the whole into dough. This is to be made into loaves, and well baked, but not burnt: and the *horse* is to have a good quantity of it every morning for five or six days, without any other provender.

The other method is much nicer, but perhaps does not any way better answer the intended purpose of heartening up the creature. It is this: take wheat-meal, rye-meal, bean-meal, and oat-meal, of each half a peck; aniseed and liquorice, of each an ounce; white liquorice, four ounces: beat all these to powder, and sift them together; then add the whites and yolks of twenty new-laid eggs, and as much white-wine as will make the whole into a dough. Let this be made into great loaves, and well baked; it must not be given the *horse* too new, but when it has stood about three days, it may begin to be used; the outside is always to be chipped off when any of it is given. These are the two sorts of bread usually given to prepare *horses* for long journeys. But there are three other receipts for making bread for race-*horses*, which are as much esteemed, and are given

by our expert jockies for the second, third, and fourth fortnight's feed. The first kind is made in this manner: take three pecks of clean beans, and one peck of fine wheat; let these be ground together, and kneaded into dough, with a large quantity of fresh butter or yeast, but with as little water as may be; when this has heaved and worked up a little, let it be kneaded again, and then made into large loaves and carefully baked; when three days old, it may be given to the *horse*, but not sooner.

The second sort is to be made as the other, only with equal quantities of beans and wheat, and the crust of this is to be cut quite away before it is eat. This is to be given to the *horse* at his usual meals, either alone, or mixed with oats and split beans.

The third sort of bread is stronger than either of the others, and is to be made thus: take three pecks of wheat, and one of beans; let them be ground together, and made into very fine flour; knead this up into dough with a good quantity of yeast dissolved in as much strong ale as is necessary; add the whites of twenty eggs, and make the whole into large loaves. These must be thoroughly baked, and when they have stood three days, the crust must be cut off, and the crumb only given, either alone, or mixed with oats or split beans. This is to be the food for the last fortnight.

HORSE, Chestnut. See HORSE CHESTNUT.

HORSE, Curlew. See HYPOBROMUS.

HORSE-DUNG, in *Gardening*, is of great use in making hot beds, for the raising all sorts of early crops: as salad, cucumbers, melons, asparagus, &c. for which purposes no other kind of dung will do so well. *Horse-dung* ferments the strongest; and if mixed with litter and sea-coal ashes in a due proportion, will continue its heat much longer, than any other sort of dung whatever: and afterward when rotted, becomes an excellent manure for most sorts of land; more especially for such as are of a cold nature. For if it clayey land, *horse-dung* mixed with sea-coal ashes, and the cleansing of London streets, will cause the parts to separate much sooner than any other compost: so that where it can be obtained in plenty, it is always to be recommended for such lands. See DUNGO.

HORSE-HAIR, anemol, a term used to express a sort of long and slender water-worm, of a blackish colour, and so much resembling a *horse-hair*, that it is generally, by the vulgar, supposed to be the hair fallen from a *horse's* mane into the water as he drinks, and there animated by some strange power. Dr. Lister has at large confuted this absurd opinion, in the Philosophical Transactions. See AMPHIBIENA AQUATICA.

HORSE-HAIR-TUFTS. See AMPHIBIENA.

HORSE-HOUL, in *Botany*. See SPAR URT.

HORSE-BOING, Hylandry. See HORING and HUSBANDRY.

HORSE-MACKREL. See MACKREL.

HORSEMAN, the name given to a particular species of pigeon, called by Moore the *colomba tabularia minor*. It very much resembles in shape the *CARRIER-PIGEON*, but it is smaller, and shorter necked; the protuberant flesh on the beak, and round the eye, is also less in quantity; it is more barrel-headed also, and the eye is somewhat pinched. It is matter of dispute whether this be an original species of pigeon, or a hybrid between the carrier and tumbler pigeons.

There are of this species all sorts of feathers, but the blue and blue-pieds are the most valued. These are of the sort of pigeons made use of in England for carrying letters, and flying for wagers; for the true original carriers are now very scarce, and not risked on every trifling occasion.

HORSEMANSHIP, the art of breaking, disciplining, and managing horses.

Horsemanship, in its latitude, includes what relates to the knowledge of the make, colour, age, temper and qualities, of *horses*; their respective countries and climates, with the manner of breeding, propagating, &c. the discovery of the uses or services they are fitted for; whether the wars, the race, the saddle, or labour; and forwarding and accommodating them for this purpose.

In this general sense, it also includes the knowledge of the defects and diseases of *horses*, and the remedies proper for the same, with the several operations requisite therein, as *docking, gelding, shoeing*, &c. and thus enters in the farrier's province.

But the word is in a more peculiar manner understood of the art of riding, or of directing a horse to advantage; not only in the ordinary motions, but more especially in the managing, or making him work upon voltages, &c.

See MANEGE.

HORSE-MINT. See MINT.

HORSE-MULE. See MULE.

HORSE-RADISH. See HORSE RADISH.

HORSE-SHOE, a cover or defence for the sole of a horse's foot. See **SHOE**.

Of these there are several sorts; as, the **SHOE**, *Plancher*, or *Panicle*, which is said to make a good foot, and a bad leg; because it makes the foot to grow beyond the measure of the leg. It is chosen for a weak heel, and will last longer than any other shoe; being borrowed from the mill, which has weak heels, and leather, to keep the feet from stones and gravel.

SHOES with Calkins, which, though intended to secure the horse from sliding, yet are repated by many to do him more harm than good; in that he cannot tread evenly upon the ground; whereby, many times, he wrenches his foot, or strains some line, especially upon stony ways, where stones will not suffer the calkins to enter. *Double calkins* are less hurtful, as he treads even with them than on the single calkins; but then they must not be over-long, or sharp-pointed, but rather short and flat.

SHOES with Rings: these were first invented to make the horse lift his feet up high, though such shoes are more painful, than helpful, besides the unhandiness of the horse. The fault of not lifting the feet high enough is most incident to horses that have not found hoofs; for tender feet fear to touch the ground hard: but what is intended for remedy proves a prejudice to the horse, by adding high calkins, or rings to his shoes; as by that means his heels are made weaker than before.

SHOES with fuelling Hells or Borders round about them, are used in Germany, &c. which being higher than the heads of the nails, save them from wearing. These are the best sort of lasting shoes, if made of well-tempered stuff, as they wear equally in all parts; and the horse treads evenly upon them. Others, who use to pass mountains and places where smiths are not so easily met with, carry shoes about them, with sides, whereby they fasten them to the horse's hoofs without the help of the hammer or nail: yet is this more for their service; for though such shoes may save a horse's feet from stones, yet it so pinches his hoof, that he goes with pain; and perhaps injures it more than the stones do. On such emergent occasions, therefore, it were better to make use of the

SHOE, Joint, which is made of two pieces, with a flat rivet nail joining them together in the toe, so that it might be taken both wide and narrow, to serve any foot.

SHOE, Pant or Pantable, which opens at the heels, and helps hoof-binding. To which may be added, *half-pantable shoe*.

SHOE, Patten, is used for a horse that is burnt in the hip, distile, or shoulder; as it causes him to bear upon that leg the grief is on, and consequently makes him use it better.

HORSE-SHOE, in *Fortification*, is a work sometimes of a round, sometimes of an oval figure, inclosed with a parapet, raised in the ditch of a military place, or in low grounds; sometimes also to cover a gate; or to serve as a lodgment for soldiers, to prevent surprizes, or relieve an over-tired defence.

HORSE-SHOE HEAD, a difcase in infants, wherein the sutures of the skull are too open, or too great a vacuity is left between them, so that the aperture shall not be totally closed up, or the cranium in that part not be so hard as the rest for some years after.

This openness is found to be increased upon the child's catching cold. When the difcase continues long, it is reputed a sign of weakness, and short life. In this case, it is usual to rub the head now-and-then with warm rum, or brandy, mixed with the white of an egg, and palm-oil.

Sometimes the disorder arises from a collection of waters in the head, called an *HYDROCEPHALUS*.

HORSE-FOE FEEL. See **VERGEN**.

HORSE-MASURE is a rod of box, to slide out of a cane, with a square at the end, being divided into hands and inches, to measure the height of horses.

HORSE-TAIL, epipetium, in *Botany*, the name of a genus of ferns of the *crystallina* class, the characters of which are these: the flower is of the apertous kind, being composed of a number of stamens, each furnished with a mushroom-like head, and all disposed in a sort of spiked form. These flowers are barren, and the seeds of the same species grow on plants of a very different figure, which have no flowers, and only produce black rough seeds. To this it is to be added, that the plant consists of several joints, one received into another, in the manner of larger and smaller robes. There are several species of *horse-tail*, which are found in England, on the sides of ditches or in shady woods; but they are never cultivated in gardens.

The common great marsh *horse-tail* is used in medicine as an allgient and vulnerary. Schröder recommends it

in all kinds of hemorrhages, and exulcerations of the kidneys and bladder.

HORSE-TAIL, juniper, *Ephedra*, in *Botany*, a genus of the *decuss monadelphica* class; the characters are, that it has male and female flowers in different plants; the male flowers are collected in catkins, which are feathery, each scale covering a single flower; these have no petals, but seven stamens, which are joined in form of a column, and terminated by roundish filaments; the female flowers have an oval perianthium, composed of five series of leaves; these have no petals, but have two oval gemmas, sitting upon the perianthium, supporting short styles, crowned by single stigmas; the gemma afterwards turn to oval berries, each of which has two seeds. This is a low shrubby plant, which grows naturally upon the rocks by the sea, in the south of France, in Spain, and in Italy; and is preserved in several gardens for the sake of variety, but has little beauty. Miller.

HORSE, Tongue. See *BURCHER'S Broom*.

HORSE WORM, in *Natural History*, a species of fly-worm called also *WERT*, produced of eggs deposited by a two-winged fly, of the shape and size of the humble-bee, in the intestines of horses.

The worms of the human bowels have not been longer known to the world than those of the horse; and the facturers in all ages, who have undertaken the care of these valuable animals, have had their remedies for the long worms bred in their intestines, and also for the short ones. The short ones are the creatures here to be described. But though the world has so long been acquainted with their existence, it never knew their origin till Mr. Wallisner discovered of late that they were produced from one of the humble-bee flies.

These flies always live in the open fields, and are never found about towns and houses, and this is the reason that those *horse flies* which are kept up in the stable in the summer and autumn, are never found to be subject to these worms.

In the latter end of summer, and toward autumn these flies are found continually buzzing about the backs of horses in the open fields, and their whole business there is to deposit their eggs, where nature has instructed them to do it.

Horse at this season are sensible of the business of this little annoymer, and have been seen from the most quiet state to jump, run about, and kick, only at the sound of the wings of one of these flies, which has been at that time searching for an opportunity to deposit its eggs in them.

A fly has been seen, when it has not succeeded in its attempt in this manner, to fly with less noise toward a single horse in another part of the field, sily to creep under his tail, to use some gentle titillation in order to make the creature open his fundament, and, when a little open, has ventured to crawl in, and without doubt then only found himself in a proper place for the depositing her eggs for a few moments. After this the *horse* has jumped, kicked, and capered as if mad, and continued so for a quarter of an hour: hence we may infer one reason against depriving horses of the safeguard of their tails, in compliance with an absurd fashion.

The worms hatched from these eggs, or perhaps living worms there deposited, if the fly be of the viviparous kind, soon find their way farther up the intestines, and often penetrate even into the stomach.

After a sufficient time for these worms to acquire their destined growth, they naturally quit their old place of abode; in order to this they all get toward the lower part of the intestines, and are either voided by the creature with its dung, or of themselves crawl out.

There is nothing singular in the figure of these worms; they are larger than those of the common flesh-fly, and smaller than those of the ox-fly; they are somewhat of a conic figure; their head being pointed, and their posterior part much larger; they are of different colours, some greenish, and others yellowish, and some brown; they are provided with each two crustaceous hooks, by which they lay hold and pull themselves along by that means, and prevent their being forced out of their habitation by the feces of the horse. It is supposed that clysters of oil are a remedy for this disorder in horses; but it probably it is of no effect, since the oiling over the whole body of the worm, may, the introducing drops of oil into the cavity where the great ligaments are, has not been found to kill the animal.

When these worms are only in small numbers in a horse, they are of no harm to the animal; but there are seasons in which they increase to such vast numbers, that they are a very fatal malady; and, in some years, when horses have died of a sort of epidemic malady, after they have been opened, prodigious numbers of these worms have been found living in their stomachs, each having eat itself a sort of cell in the membrane of the stomach, and all being

being lodged there as close together as the seeds in a pomegranate.

We are not to wonder at all how such immense numbers of worms come into one *herf*, since one female is able to deposit more than seven hundred, as Mr. Vallinieri has observed.

When these worms are fallen from the intestines of the *herf*, they crawl about till they find some place of safety, where they make a shell of their skin, and puls all their changes, and from whence they finally come out in form of the parent fly. See *Rezumur*, *Hill*, *Inf.* vol. iv. p. 545, 546. See also Vallinieri.

HORSHAM *flax* is a kind of thin broad flax, of a greyish colour; formerly much used, especially in Sudex, to heal or cover churches and churches, great houses, &c. but on account of its weight very unfit for the purpose. It is called *Horsham flax*, because chiefly brought from the town of Horsham in Sudex.

HORTA, in *Antiquity*, a goddess among the Romans, who presided over youth, and excited them to virtue by her exhortations. Her temple is never shut, to admonish youth, so liable to be seduced, *ceres in virtutis flit*, that they should be always disposed with particular vigilance over themselves to the practice of virtue.

HORTAGILERS, in the grand seignior's court, are upholsters, or tapestry-hangers.

There is no city better or more orderly regulated than the grand seignior's camp; and to have a notion of the magnificence of that prince, he must be seen in that equipage; as he is much better lodged and accommodated there, than at Constantinople, or any other city of his dominions.

He has always two tents or pavilions, and two sets of furniture entire; that, while he is in one, they may pitch or spend the other.

In order to this, he has constantly four hundred *hortagilieri*, or upholsters, in his retinue, who go a day's journey before him to fix on a proper place. They first prepare the sultan's tent, and then those of the officers of the Porte, and the beglerbegs, according to their rank.

HORTATOR, in the *Roman Navigation*, an officer whose business it was to give the word of command to the rowers, and to direct them when to stop, and when to ply their oars.

The Greeks gave the name of *ERLEUSTES* to this officer.

HORTICULTURE, compounded of *hortus*, garden, and *cultus*, I till, dress, &c. the art of gardening. See *GARDENING*.

HORTULANUS, in *Ornithology*, the name of a species of the *EMBERIZA*, in the Linnæan system, though some writers have made this a distinct genus.

HORTUS, a name used by some authors for the female genital parts of animals.

HORTUS ficus, a dry garden, a name given to a collection of specimens of plants, carefully dried and preserved. The value of such a collection is very evident, since a thousand minutes may be preferred in the well-dried specimens of plants, which the most accurate engraver would overlook. We shall therefore give two methods of drying and preserving a *hortus ficus*; the first by Mr. Robert Southwell in *Phil. Trans.* N. 277, and the other by Dr. Hill, in his Review of the Works of the Royal Society; with his objections to Mr. Robert's method.

According to the former gentleman, the plants are to be laid flat between papers, and then put between two smooth plates of iron, screwed together at the corners; and in this condition committed to a baker's oven for two hours. When taken out, they are to be rubbed over with a mixture of equal parts of aqua fortis and brandy; and after this to be flattened down on paper with a solution of the quantity of a walnut of gum tragacanth dissolved in a pint of water. See *HERBAL*.

To this the doctor objects, that the heat of an oven is much too uncertain to be employed in so nice an operation; and that the space of time ordered for continuing the plants in it, is of no information, unless the degree of heat, and even the different nature of the plant, as to its succulence, and the firmness or tenderness of its fibres, be attended to; there being scarcely any two plants alike in these particulars: consequently the degree and duration of heat sufficient for one plant, would destroy another. Beside which, the acid used, destroys the colour of many plants, and never recovers that of others lost in the drying; and frequently after the plant is fixed down, both the paper it is fixed to, and that which falls over it. Dr. Hill's method is as follows. Take a specimen of a plant in flower, and with it, one of its bottom leaves, if it have any; bruise the stalk if too rigid, or slit it if too thick; spread out the leaves and flowers on paper, cover it with more paper, and lay a weight over all. At the end of eighteen hours take out the plants, now perfectly

flattened, and lay them on a bed of dry common sand; sift more dry sand over them to the depth of two inches, and thus let them lie about three weeks: the less succulent dry much sooner, but they take no harm afterward. If the floor of a garret be covered in spring with sand two inches deep, leaving space for walking to the several parts, it will receive the collection of a whole summer; the covering of sand being sifted over every parcel as laid in, they need no further care, from the time of laying them till they are taken up to be stuck on paper. The cement used by the doctor is thus prepared: early in the spring, put two ounces of camphor into three quarts of water in a large bottle, shake it from time to time, and when the first collected plants are ready for the flattening down, put into a pint of the water, poured off into an earthen vessel that will bear the fire, two ounces of common glue, such as is used by the carpenters, and the same quantity of chyluscola beat to lumps; let them stand six and thirty hours, then gently boil the whole a few moments, and strain it off through a coarse cloth: this is to be warmed over a gentle heat when it is to be used, and the back of the plants smeared over with a painter's brush: after this lay them on paper, and gently press them for a few minutes, then expose them to the air a little, and finally lay them under a small weight between quires of paper, to be perfectly dried.

It is scarcely to be conceived how strongly the water becomes impregnated with the camphor by this simple process: a part of it indeed flies off in the making of this cement and the using of it; but enough remains with the plants to prevent the breeding of insects in it. He farther observes, that plants may be dried very well without our sand, by only putting them frequently into fresh quires of paper, or a few, by only pressing them between the leaves of a book: but the sand method preserves the colour best, and is done with least trouble.

Another method much better than that of the oven, is the flattening and drying the plant by passing a common smoothing iron for linen over the papers between which it is laid: but for nice things the most perfect of all methods is that by a common hand heat, such as is used for chemical purposes. The cold sand is to be spread smooth upon this occasion, the plant laid on it carefully flatted, and a thick bed of sand sifted over: the fire is then to be made, and the whole process carefully watched, until by a very gentle heat the plant be carefully dried. The colour of the tenderest herb, may by this manner be preserved; and flowers that can no way else be preserved, may be managed perfectly well thus.

HOSANNA, in the *Hebrew Ceremony*, a prayer which they rehearsed on the several days of the feast of tabernacles.

It was thus called, because there was frequent repetition therein of the word *HOSIA*, *hosia* name, or *hosia* given, i. e. save us now, or, save us, we pray.

There are divers of these *hosannas*. The Jews call them *hosannas*; i. e. the *hosanna*. Some are rehearsed on the first day, others on the second. See which they call *hosanna* of the first day, *hosanna* of the second day, &c.

HOSANNA Rabba, or *Grand Hosanna*, is a name they give to their feast of tabernacles, which lasts eight days, because during the course thereof, they are frequently calling for the assistance of God, the forgiveness of their sins, and his blessing on the new year; and to that purpose they make great use of the *hosannas*, or prayers above mentioned.

The Jews, also, apply the term *hosanna rabba*, in a more peculiar manner, to the seventh day of the feast of tabernacles; because they apply themselves more immediately on that day to invoke the divine blessing, &c.

HOSE, from the Saxon *hosa*, a stocking. See *STOCKING*. **HOSE** in *Hort*, among Botanists, signifies one long hulk of a flower within another; as in the polyanthus. See *PRIMOIRE*.

HOSE-HUSE, in *Botany*, a long round hulk; as in pink, july-flowers, &c.

HOSEA, in *Scripture History*, a canonical book of the Old Testament, so called from the prophet of that name, its author; the first of the lesser prophets. He lived in the kingdom of Samaria, and delivered his prophecies under the reign of Jeroboam II. and his successors, kings of Israel; and under the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah. His principal design is to publish the gross idolatry of the people of Israel, and to denounce the divine vengeance against them, and to foretell the captivity in Assyria.

HOSPITA, in *Antiquity*, a form of Venus, under which appellation she was worshipped, and had a temple at Memphis in Egypt.

HOSPITAL, popularly *SPITAL*, a place of lodging erected, endowed, or supported by charitable contributions, for the reception and relief of the poor, aged, infirm, sick, and otherwise helpless.

The word is formed of the Latin *hospes*, *host* or *stranger*. In the first ages of the church, the bishop had immediate charge of all the poor, both found and distressed; as also of widows, orphans, strangers, &c. When the churches came to have fixed revenues allotted them, it was decreed, that, at least, one fourth part thereof should go to the relief of the poor; and to provide for them the more commodiously, divers houses of charity were built, which are since denominated *hospitals*.

They were governed wholly by the priests and deacons, under the inspection of the bishop.

In course of time, separate revenues were assigned for the *hospitals*; and particular persons, out of motives of piety and charity, gave lands and money for erecting of *hospitals*.

When the church-discipline began to relax, the priests, who, till then, had been the administrators of *hospitals*, converted them into a sort of benefices, which they held at pleasure, without giving an account thereof to any body, reserving the greatest part of the income to their own use; so that the intentions of the founders were frustrated. To remove this abuse, the council of Vienna expressly prohibited the giving any *hospital* to secular priests in the way of a benefice; and directed the administration thereof to be given to sufficient and responsible laymen, who should take an oath, like that of tutors, for the faithful discharge thereof; and be accountable to the ordinaries. This decree was executed, and confirmed by the council of Trent.

In England, *hospitals*, founded for the mere relief of the indigent and necessitous, are peculiarly called *almshouses*; the name *hospital* being reserved to those destined for the sick, aged, young, &c.

Any person seized of an estate in fee simple, may by deed intitled in chancery, erect and found an *hospital* for the sustenance and relief of the poor, to continue for ever: and place such heads &c. therein as he shall think fit: and such *hospital* shall be incorporated, and subject to such writs &c. as the founder shall nominate. Also such corporations shall have power to take and purchase lands not exceeding two hundred pounds per annum, so as the same be not holden of the king, &c. and to make lease for twenty-one years, reserving the accustomed yearly rent: but no *hospital* is to be erected, unless upon the foundation it be endowed with lands or hereditaments of the clear yearly value of ten pounds per annum. Stat. 39 Eliz. cap. 5.

This act was made perpetual by the 21 Jac. cap. 1. It is understood in consequence of this statute, that if the lands given to an *hospital* be afterwards improved, they shall be enjoyed by the *hospital*, though they should be above the yearly value of two hundred pounds. And goods and chattels, real or personal, may be taken of what value soever. But by 9 Geo. II. cap. 36. no lands nor money shall be conveyed or settled in trust, for the benefit of any charitable foundations, unless the appointment of lands, money, or personal estate, stocks in the public funds excepted, be made by deed intitled, sealed and delivered in the presence of two witnesses, at least twelve calendar months before the death of the donor, and be intitled in chancery within six calendar months next after the execution thereof; and unless such stock in the public funds be transferred in the public books usually kept for the transfer of stocks, at least six calendar months before the death of the donor, and take effect immediately and without the power of revocation. By 43 Eliz. cap. 4. the lord chancellor may issue commissions to take account of misapplication of lands and goods, given to *hospitals*, which have no special visitors or governors. By 31 Eliz. cap. 6. the place of any person, taking reward for nominating to an *hospital*, shall be void. By the aforesaid Stat. of the 30 Eliz. cap. 5. it is provided, that all leases of estates for a term exceeding the number of twenty-one years, in possession, and on which the accustomed yearly rent or more, by the greater part of twenty-one years next before the taking of such lease shall not be received and yearly payable, shall be void. By 43 Eliz. cap. 2. all lands within the parish are to be allotted to the poor's rate, and it has been determined by courts of law, particularly by Holt, in 1 Anne, that *hospital* lands are chargeable to the poor as well as others. 2 Salk. 577. In the case of St. Luke's *hospital*, by 1 Geo. III. it was determined in general, that no *hospital* is chargeable to the parish rate, with respect to the site thereof, except those parts of it which are inhabited by the officers, whose apartments are to be rated as single tenements, of which the said officers are the occupiers. By the annual acts for the land tax, it is provided, that the same shall not extend to charge any *hospital*, for or in respect to the site of such *hospital*, or any of the buildings within the walls or limits thereof; or to charge any of the houses or lands, which on or before Mar. 25. 1693, did belong to Christ's *hospital*, St. Bartholomew,

Bridewell, St. Thomas, and Bethlehem *hospitals*, or to charge any other *hospitals* or almshouses, for or in respect of any rents or revenues, which on or before March 25. 1693, were payable to the said *hospitals* or almshouses, for the immediate relief of the poor. But all such lands &c. belonging to any *hospital* or almshouse, or rented to any charitable or pious use, as were assigned in the fourth year of W. and M. shall be liable to be charged.

The principal English *hospitals* are the following:

HOSPITAL, ABBEY or HABSDATHERS, is an *hospital* situated at Hoxton and erected in 1693, by the company of Haberdashers, in pursuance of the will of Robert Alee, esq. who left for building and endowing it 30,000l. This *hospital* is established for the maintenance of twenty poor haberdashers, and the support and education of twenty boys. Each of the pensioners in this *hospital* has convenient apartments, is provided with proper diet and firing, three pounds yearly in money, and a gown every second year. There are also established salaries, &c. for chaplain, clerk, butler, porter, and other domestics.

HOSPITAL, St. Bartholomew's, is situated on the south-east side of Smithfield, and incorporated by the name of the *hospital* of the mayor, commonalty and citizens of London, governors for the poor, called Little St. Bartholomew's, near West-Smithfield. This *hospital* formerly belonged to the priory of St. Bartholomew, in Smithfield, founded by one Rahere, about the year 1102.

At the dissolution of the monasteries, Henry VIII. left five hundred marks a year to it, on condition that the city should add five hundred marks per annum for the relief of sick and poor people; but it was more largely endowed, for the use of sick and lame persons only, by Edward VI. by the munificence of the city and private benefactors. This *hospital*, having escaped the dreadful fire in 1666, was repaired and beautified by the governors in the year 1691. But the buildings became by length of time so ruinous and dangerous, that a subscription was entered into in 1729, for defraying the expense of rebuilding it, on a plan comprehending four detached piles of building to be joined by three gate-ways, about a court or area. Four piles have been erected and finished; one of these piles contains a large hall for the resort of the governors at general courts, a computing-house for the committees, and other necessary offices; the other three piles contain wards for the reception of the patients, &c.

It is governed by a president, treasurer, &c. It is furnished with three physicians, and three master surgeons, besides 25 many assistant surgeons, an apothecary, and vicar. The officers of this *hospital* are a cook, steward, renter, matron, and porter. This *hospital*, since its enlargement, is capable of accommodating four hundred and twenty patients. It extends relief also to a great number of out-patients. By the report of 1780, it appears that this *hospital* administered relief to 10846 patients, in the course of the preceding year.

HOSPITAL, Bethlehem, or Bedlam, was originally a priory, founded by Simon Fitzmaurice, sheriff of London, in the year 1246; but in the year 1265, king Henry VIII. gave this *hospital* to the city, who employed it for the accommodation of lunatics. The present stately fabric was erected by the city of London in the year 1675, at a charge of about seventeen thousand pounds. It is in length five hundred and forty feet, and forty feet broad, and contains a great number of cells, or rooms for the accommodation of the unfortunate, who are maintained without any expense to their friends; except an allowance for bedding. At each end of this stately edifice are erected, by the charitable contributions of the citizens, two wings, or spacious buildings for the reception of poor incurable lunatics. Before this magnificent structure there is a pleasant garden, inclosed by a stately wall about seven hundred feet in length. This *hospital*, being united to that of Bridewell, has the same president, governors, whose number is about two hundred, treasurer, clerk, auditor, physician, surgeon, and apothecary; but each *hospital* has a steward, and inferior officers peculiar to itself. The number of patients in this *hospital* under cure in 1780 was 252.

HOSPITAL, Bridewell. See BRIDEWELL.

The domestics peculiar to this house are, a steward, chaplain, reader, porter and his tervant, matron and headles, one of whom is chapel-clerk.

HOSPITAL, Charter-house. See CHARTERHOUSE.

This is also called king James's *hospital*, because he established it by letters patent, in the year 1611, confirmed by parliament in 1628; and *Sutton's hospital*, from the name of its founder.

HOSPITAL, Christ's, popularly called the *New-spital*, was anciently a monastery of grey friars, founded by Rahere, the first prior thereof, in the time of Henry I. It was dissolved by Henry VIII. and granted by him to the city in 1547; and the grant to the citizens was confirmed

firmed in 1552, by charter of Edward VI. who converted it into an *hospital* for poor children; who are supplied with all necessities and conveniences, clothed, dieted, and taught.

Since its first endowment it has received abundance of new donations. Besides the numerous benefactions of private persons, the city allows this house the benefit of superintending and licensing the curia of London; and a duty of about 1 upon every cloth brought to Blackwell-hall, where clerks are kept to receive it. The citizens by king Edward's charter are incorporated governors of his several foundations in the city and liberties of London, by the name of the mayor, commonsality and citizens of the city of London, governors of the possessions, revenues, and goods of the *hospitals* of Edw. VI. &c. A great part of it was burnt down by the great fire; but is again rebuilt by the care of the governors; though not without incurring a great debt, and anticipating the revenues of the *hospital*.

Formerly, a thousand poor children, most of them orphans, were maintained on this foundation; eight or nine score yearly put out apprentices, and the girls to service; but the number, through the deficiency of the funds, grew after wards much less. Besides the children that are maintained within the walls of this *hospital*, there is a considerable number of the least and youngest provided for in the country, viz. at Hertford, in Hertfordshire, where there are a school-house, a master's house, and several houses for nurses employed in taking care of the children. The number of children under the care and charge of this *hospital* in 1780. was 1200.

Here were two mathematical schools; the first founded by king Charles II. but they are now united. Youths are there taught several parts of practical mathematics, particularly navigation, to fit them for apprentices to masters of ships: there is also a grammar-school (whence the most improved boys are yearly sent to the university), a writing-school, and a school for the girls, where they learn to read, to sew and to mark. The masters of these schools are four; viz. a grammar master, who is assisted by an under master, a mathematical master, and a writing master, who have 100 l. per annum each, for their salaries, besides houses. There are also two schoolmistresses. The grammar master hath an addition of 20 l. yearly for catechising the boys, and his other is allowed 50 l. a year. There are likewise a drawing-master, and a music-master.

The officers of this *hospital* are a president, treasurer, physician, chief-clerk, under clerk and receiver, surgeon, apothecary, wardrobe-keeper, and assistant clerk, steward, &c. The number of governors superintending this *hospital* is very considerable; generally above three hundred.

HOSPITAL, Emanuel, is situated at Tothill-fields, in Westminster, and was founded by Lady Dacre, in 1601, for twenty aged single men and women, each of whom have an allowance of 10 l. per annum, with the liberty of bringing up a poor child. The city of London has this charity in trust, with 2000 l. a year for its support, arising from a lease of 100 years, at the expiration of which, the whole manor of Bramhamton, in the county of York, amounting to above 600 l. per annum, is devised for the augmentation of this foundation. In 1735 the court of lord-mayor and aldermen erected a school-house and dormitory, adjoining to this *hospital*, for the reception of twenty poor boys and girls who are supplied with all the necessities of life: the boys are taught to read, write and account, and the girls to read, write and do plain-work.

HOSPITAL, Foundling, was established, at the solicitation of Thomas Coram, *sq.* by royal charter, in the 13th year of George the II. and incorporated by the name of *The governor and guardians of the hospital for the maintenance and education of exposed and deserted young children*; and the powers granted by charter were enlarged and confirmed by a statute of the same year. This charity is under the management of a president, the king being patron; two vice-presidents, treasurer, and governors. The subordinate officers are a chaplain, morning preacher, secretary, solicitor, steward, marion, school-master, and treasurer's clerk. This *hospital* has two physicians, a surgeon and apothecary. In 1742 the noble building in Lamb's-conduit fields for the use of this *hospital* was begun to be erected; one wing was finished in 1745; the chapel was begun in 1747; and in 1749 orders were given for building the other wing of the *hospital*. The children admitted to this *hospital* are nursed, educated and employed under proper regulations, and provided with all necessities, till they attain the age appointed by parliament for their discharge viz. twenty-four for males, and twenty-one for females, unless they be previously

married with the consent of the committee; at such time, the general committee, at their discretion, may give them cloaths, money, or necessities, not exceeding the value of ten pounds. In the mean while, the corporation of the *hospital* may employ the children educated and maintained here in any sort of labour, or manufacture, or in the sea service; and bind such children apprentices, or place them out as servants, or mariners, to any husbandman, miller or captain of a ship, or other person, until the aforesaid respective ages. The corporation of this *hospital* is allowed to purchase lands or tenements to the yearly value of 4000 l.

HOSPITAL, French, in the parish of St. Luke, was erected in the year 1717; and the governors of it, by letters patent of Geo. I. anno 1718, were constituted a body politic and corporate, by the appellation of *The governor and directors of the hospital*, for the poor French Protestants and their descendants, residing in Great Britain. To this foundation belong a governor, sub-governor, treasurer, secretary, steward, and chaplain, physician, surgeon, and matron.

HOSPITAL, St. George's, near Hyde-park Corner, was instituted in 1733 for the relief of the poor, sick, and lame, who are supplied with advice, medicine, diet, washing, lodging, and some of them also with cloaths. This *hospital* is under the direction of a general board of the governors, who meet regularly five times a year. The qualification of a governor is 5 l. as an annual subscription, or 50 l. as a single benefaction. The king is president, there are three vice-presidents, two treasurers, four physicians, four surgeons and one assistant surgeon, six visiting apothecaries; the domestic officers are a chaplain, apothecary, secretary, matron, and messenger. Besides the patients that are admitted into the house, relief is afforded to a considerable number of out-patients. Recommendations to this charity are received every Wednesday morning.

HOSPITAL, Greenwich, is a retreat for seamen, who, by age, wounds, or other accidents, are disabled from service; and for the widows and children of such as are slain in the service.

This, in point of magnificence and spaciousness, greatly excels even Chelsea *hospital*. King William and Queen Mary had the benevolent design of establishing this *hospital* much at heart; and they accordingly made a grant of the royal palace at Greenwich, a part of which, on the west side, had been begun to be rebuilt for a royal palace by king Charles the second, and also a large adjoining piece of ground, for this purpose. King William, after Queen Mary's death, on the 25th of October, 1695, appointed by patent a number of commissioners for directing the building and endowing of this intended *hospital*, and granted a large sum out of his civil list for that end, and his royal servants were also considerable benefactors to it. At length annual sums were granted by parliament for fulfilling this truly magnificent ornament and glory of Great Britain: and it was fully completed in the reign of George the III. By an act of the 7th and 8th of King William, cap. 21. the privilege of admission into this *hospital* was granted to registered seamen, when maimed or maimed, and to the widows and children of those, who were killed in the service. This act for registering seamen was enforced by 8 and 9 W. III. cap. 22. but repealed by 9 Anne. Every seaman is required to allow out of his wages six pence a month, for the better support of the said *hospital*; for which duty receivers are appointed &c. The money is paid into a receivers office, on Tower-hill, which is under the management of three commissioners and their clerks. 8 and 9 W. 3. cap. 23. 10 Anne. 2 Geo. II. cap. 7. By the last act a seaman absenting himself from his ship without leave, shall forfeit for every day's absence two day's pay to Greenwich *hospital* to be deducted out of his wages; and a seaman, not entering into the king's service, who shall leave his ship before he hath a discharge in writing, shall forfeit one month's pay, in like manner.

By 8 Geo. II. cap. 20, the net rents and profits of the estates forfeited by the attainer of James late earl of Derwentwater, and of Charles Radcliffe, were applied in the first place to the completing of the building of Greenwich *hospital*; and it is hereby enacted, that all seamen in the merchants service who shall happen to be maimed in fighting, not only against pirates, but against any enemy of his majesty, &c. shall be admitted into and provided for in the said *hospital*, as well as seamen maimed or disabled in the king's actual service, and in the next place, the whole net rents of those forfeited estates shall be for ever applicable for the support of the said royal *hospital*, for the better maintenance of the seamen therein, worn out and become decrepit in the service of their country. This law was further explained and amended by 11 Geo. II. cap. 30.

Provision is made for securing the payment of the five pence per month from privateers by 18 Geo. II. cap. 21 and for securing prize money belonging to the hospital by 20 Geo. II. cap. 24. The governors are empowered to grant out-pensions to decrepit seamen, by 3 Geo. III. cap. 16. and persons performing or falsely assuming the name and character of out-pensioners, shall be guilty of felony without benefit of clergy; and those who receive half yearly pensions shall, together with the printed bill delivered to them by the commissioners, produce a certificate under the hand of the minister and churchwardens, where they reside, testifying that they are the persons named in such bill.

To this hospital there belong 2169 pensioners, 740 boys, and 138 nurses. The pensioners are clothed in blue and are allowed stockings, shoes, linen, and a shilling a week for other necessities. The victualing is according to the allowance of Chelsea hospital, viz. four men in a mess, each mess to contain four pounds of beef, a gallon of beer, &c.

The governors of this hospital are the great officers of state, and persons in high posts under the king; and viz. under the more particular inspection and government of twenty-four commissioners, a governor with an annual salary of 2000*l.* and clerk, a lieutenant governor, whose salary is 400*l.* a year; four captains, allowed 250*l.* a year each; and seven lieutenants, with 150*l.* a year each; a treasurer whose salary is 200*l.* with two clerks; a secretary, with 100*l.* a year and clerk, auditor whose annual salary is 100*l.* and clerk, surveyor with 200*l.* salary, clerk of works at five shillings a day, a physician at ten shillings a day, a surgeon with an annual salary of 150*l.* a servant and two assistants, dispenser with 50*l.* a year and his assistant, two chaplains with a salary of 150*l.* each, steward with a salary of 100*l.* and three clerks; clerk of cheque with 100*l.* salary and three clerks; three matrons, organist, messenger, two chief cooks and four mates, scullery man and two mates, butler and two mates, porter and barber.

HOSPITAL, GUY'S, situated in the parish of St. Thomas, Southwark, was founded, in his life-time, by Thomas Guy, esq., a very wealthy citizen and bookkeeper of London. For this purpose he took a lease of a piece of ground belonging to St. Thomas's hospital, for the term of 999 years, at a ground-rent of 3*l.* per annum; the foundation of the intended hospital was laid in 1720, and the fabric was roofed before the death of the founder, which happened in the year 1724. The charge of erecting and furnishing this hospital amounted to the sum of 18,793*l.* and the sum left to endow it to 100,000*l.* and upwards. The governors of this hospital were incorporated by act of parliament, made in the eleventh year of Geo. I. Anno 1725, under the title of *The President and Governors of the Hospital* founded at the sole cost and charges of Thomas Guy, esq. and under this title they are empowered to purchase, either in perpetuity or for a term of years, any estate not exceeding 17,000*l.* per annum. The number of governors appointed to be chosen from those of St. Thomas's hospital by the founder is sixty; and it is enacted, that if the number does not exceed 40, the vacancies shall be supplied by the lord chancellor, lord keeper, or commissioners of the great seal, lord chief justices of the king's bench and common pleas, and lord chief baron of the exchequer, so as to make up the number of sixty. It is also enacted, that the management of the hospital be referred to a president, treasurer, and twenty-one governors; forming a committee appointed by a general court, seven of whom are annually charged; this committee is empowered to choose, and at pleasure to remove, all officers and servants employed in the hospital, except the physicians, surgeons, clerk, and chaplain, who are elected by the general court, to appoint their salaries, to admit objects of charity, and in general to transact the affairs of the hospital subject to the inspection and control of a general court; and this general court has power to make any by-laws for the better government of the corporation. This hospital is liberally endowed by its founder, was established for the reception and relief of upwards of 400 sick and diseased poor objects; besides twenty incurable lunatics, who are provided for in a separate building. Since the decease of Mr. Guy, the governors have taken a lease of an additional spot of ground, for which with the former, they annually pay to St. Thomas's hospital the sum of 100*l.* on this ground they have erected two handsome wings, in the centre of one wing there is a spacious hall and rooms for public business, and opposite to it in the other a neat and elegant chapel; in which there is a finely executed statue of the founder by Mr. Bacon. The corner house in one wing is for the residence of the treasurer, and the other houses are for the chaplain, steward, and apothecary. The hospital is under the medical inspection of three physicians and three surgeons, who are allowed

20*l.* a year each, an apothecary, who has 90*l.* a year for himself and assistant, and a house. The officers are a clerk, chaplain, steward, accountant, matron, butler and assistant, surgery men, porter, bread, keeper of the lunatic men, and keeper of the lunatic women. It contains at this time, 13 wards and 211 beds; and the number of patients admitted into this hospital, at an average for the last ten years, has been 2744 yearly; of whom 2014 have been discharged, and 230 have died; under the prudent conduct of the trustees and governors, it does great honour to the liberality of its founder. The day of admission to this hospital is Wednesday. We shall add under this article, that Mr. Guy has bequeathed to the president and governors of *Guy's* hospital, a perpetual annuity of 200*l.* for taking into the said hospital four children yearly, at the nomination of the governors of his hospital; preference being always given to his own relations, who have never failed to offer themselves. To his poor and relations he gave annuities during life to the amount of 170*l.* and among his younger relations and executors the sum of 750*l.* together with the sum of 200*l.* for discharging poor prisoners, within the city of London, and counties of Middlesex and Surrey, who could be released for the sum of five pounds.

He likewise erected an almshouse, with a library, at Lambeth, where his mother resided, and which he recommended in several parliaments, for the use of fourteen poor men and women; to whom he allowed certain pensions during life, and at their death, for their future support, and putting out children apprentices, &c. he bequeathed a perpetual annual sum of 150*l.* Mr. Guy also built and finished, at his own expence, in the year 1707, three wards on the north side of the outer court of St. Thomas's hospital; and gave to the same 100*l.* per annum, for eleven years immediately preceding the foundation of his hospital. Some time before his death, he removed the frontispiece of the said hospital of St. Thomas, which stood over the gateway in the borough, and erected the same in the place where it now stands, fronting the street; and having enlarged the gateway, rebuilt the two large houses on the sides thereof, and erected the stately iron-gate between them, at an expence of between 2 and 3000*l.* To many of his relations he gave stated allowances of 10 or 20*l.* per annum, and to others, money for advancing them in the world.

HOSPITAL, of Jerusalem. See **HOSPITALS.**
HOSPITAL, Jews, called *Beth-shalom*, or house for the relief of the sick, was founded by subscription in 1748. This charity, which administers medicines and advice gratis, is maintained by a certain fund, allowed by the synagogue, and private contributions, amounting to about 200*l.* a year. They have likewise a ward assigned for poor lying-in women.

HOSPITAL, Lock, near Hyde-park corner, was instituted in the year 1740, for the relief of poor patients. Every gentleman subscribing five pounds a year and upwards shall be a governor of this hospital, and whoever gives a benefaction of fifty pounds at one time becomes a governor for life. This hospital is under the direction of a president, seven vice-presidents, two treasurers, and a committee of the governors. It is attended by a physician, two surgeons, and two visiting apothecaries. The officers are a chaplain, house-surgeon, secretary, collector, and matron.

HOSPITAL, London, in Mile-end road, was instituted in 1746, and incorporated in 1758. This hospital is supported in a very large and commodious building, furnished with about 212 beds, by voluntary contributions for the relief of all sick and diseased persons. The charity is under the government and direction of a president, three vice-presidents, a treasurer, and of such persons, who by giving a benefaction of thirty guineas or more at one time become governors for life, or who subscribe five guineas or more per annum. A house-committee of twelve governors is appointed at every general quarterly court, one of whom is chosen chairman; four of these governors take the first month, four the next, and the other four the last month of the quarter; and they meet every week at the hospital to transact the necessary business.

There is also a committee of accounts and a physical committee, each of which consists of twelve governors. The management of the house is inspected by two governors, appointed visitors by the house-committee. Three physicians and three surgeons attend this hospital: the officers are a chaplain, apothecary, secretary and receiver, steward and two matrons. Every governor is entitled to send one in-patient at a time, and out-patients without limitation. Subscribers, that are not governors, may send as many out-patients, as they please: the day of admission is Tuesday. Since the institution of this hospital, upwards of 299,063 distressed objects have been relieved by it.

HOSPITAL, St. Luke's for lunatics, in Upper Moor-fields, was instituted in 1751. Persons paying the entire sum

of twenty guineas or upwards, or paying five guineas at least, and signing an agreement to pay five guineas yearly for the four next succeeding years, are admitted governors of this hospital, nine of whom constitute a general court, to be held twice every year. At one of these courts one president, four vice-presidents, a treasurer, a general committee, physician, surgeons, apothecary, and secretary, shall be elected for the ensuing year. The general committee is empowered to transact all the necessary business of this hospital, and to appoint sub-committees. Patients are admitted into this hospital according to the order of time in which their petitions, previously signed by a governor, have been delivered to the secretary, and without any expense, except that the pauper-poor shall provide their bedding, which they may take away at their discharge. But no person can be admitted into this hospital who is not poor and weak, or who has been a lunatic more than twelve calendar months; or who has been discharged unwell from any other hospital for the reception of lunatics, or who is troubled with epileptic or convulsive fits; or who is deemed an idiot; or who is infected with the venereal disease; nor any woman with child. Besides a petition, the governors require two printed certificates, one testifying the above particulars, signed by the minister and churchwardens, or overseers of the poor of the parish or place where the proposed patient resides; and the other to the same purpose, signed by some physician, surgeon, or apothecary, who has visited such patient; which signatures must be attested upon oath.

On the admission of every patient, two responsible housekeepers enter into a bond to the treasurer, in the penalty of 100*l.*, to take away such patient within seven days after notice for that purpose from the committee or secretary. It is also provided, that the general committee may receive immediately into this hospital any patient who shall have been discharged cured, in case such patient relapse within two months; and that such patients who have been discharged uncured, not exceeding thirty, shall be admitted by rotation, on condition of the payment of five shillings per week for each, till the charity shall be enabled to relieve that expense.

It appears from the printed state of this hospital, that the balance of the hospital time in the last year, the first day of January, 1779, was 89,500*l.* 4*s.* 11*d.* and that from the opening of the hospital on the 25th of July 1751, to the 25th of July 1766, 2514 patients have been received into the house of whom 126 have been discharged cured; and that 105 persons discharged uncured have been again received into the hospital five shillings a week.

HOSPITAL, Lying-in. There are several hospitals of this kind in the cities or suburbs of London and Westminster. The Middlesex hospital for sick and lame, and lying-in married women, in Marylebone Fields, was instituted in 1745; it is under the direction of a president, five vice-presidents, two treasurers, and a committee of the governors; the qualification for a governor is an annual subscription of three guineas, and of a governor for life thirty guineas at one payment. The lying-in ward in this hospital has no communication with those of the sick and lame. The patients are visited by four physicians, two men-midwives, and four surgeons. The domestic officers are a house-surgeon, chaplain, secretary, collector, apothecary, and two matrons or midwives. The day for admission of patients is Tuesday.

The *Birth-house* in this hospital for married women in Brownlow Street, Long-acre, was instituted in 1749. This hospital is governed by a president, four vice-presidents, a treasurer, and a committee of fifteen governors, who meet every Friday to transact the women recommended and to direct the ordinary affairs of the house. The qualification of an annual governor is a subscription of three guineas or upwards per annum, and of a perpetual governor a single payment of thirty guineas. This hospital is occasionally visited by two physicians, and two surgeons; and it is provided with an apothecary, chaplain, secretary, matron, and midwife, six nurses and sixty-two beds. Four female pupils, being widows or married women, not less than twenty-five years of age, and of approved character, are permitted to attend this hospital, for instruction in midwifery, and have a right to stay in the hospital six months. They are to board in the hospital, and dine at the steward and matron's table; and on leaving the hospital to receive certificates of their qualifications. The expenses of instruction and board are settled by a general court.

THEATRE of Bands. Lying-in hospital for married women, in the city-moor, was instituted in 1750. The government of this hospital is vested to a president, four vice-presidents, and a committee, chosen annually from among the governors and allied committees. The subscription of twenty guineas constitutes a governor for life; who shall subscribe five guineas or three guineas per annum,

are governors so long as they continue their subscription, and may recommend one pregnant woman at a time. A general court is held four times a-year, which appoints a house-committee consisting of thirteen governors, who meet every Tuesday to receive and discharge women, &c. This hospital is visited by a physician in ordinary, men-midwives and two surgeons. It is also provided with an apothecary, chaplain, secretary, matron or midwife, and a sufficient number of nurses and servants.

The Westminster new lying-in hospital, on the Surrey side of Westminster bridge, was instituted by subscription in the year 1765. It is governed by a president, six vice-presidents, and a committee of governors. It is attended by two men-midwives, a consulting physician, two superintendent apothecaries, and a surgeon. The officers are a secretary, receiver, and matron or midwife.

HOSPITAL, Hospitum, in St. George's Fields, was instituted in the year 1758 for the relief and reformation of prostitutes. The queen is patroness of this charity; it is under the direction of a president, six vice-presidents, treasurer, and committee of thirty governors. It is attended by a physician, two surgeons and two apothecaries. The domestic officers are a chaplain, steward, secretary, matron and assistant, and messenger and assistant. Twenty guineas constitute a governor for life, and an annual subscription of five guineas is a qualification for a governor for one year; which subscription when it amounts to twenty-five guineas, qualifies a governor for life. In twenty-one years, viz. from Aug. 10, 1758, to Dec. 25, 1779, there have been admitted into this hospital 1029, of which number 1206 have been reconciled to, and received by their friends, or placed in service in respectable families, and in trades.

HOSPITAL, Afflictionis, in Goodman's Fields, was established by subscription in 1774, for the cure and relief of indigent persons afflicted with the venereal disease. It is under the direction of a president, four vice-presidents, treasurer, and governors. It is attended by a physician, and two surgeons; the officers are a chaplain, secretary, clerk, apothecary, and matron.

HOSPITAL, St. Peter's, at Newington-Parish, was erected by the company of Millmongers, by virtue of letters patent of king James I. in 1618, for the reception of divers of their poor workmen, who had pentment bequeathed them by the wills of some of their company.

HOSPITAL, Royal, for disabled soldiers, commonly called *Chapel-College*.

It was founded by king Charles II. carried on by king James II. and finished by king William and queen Mary.

The building is very spacious and magnificent; its figure is a H, the middle or front part whereof consists of a chapel and hall; the other two lines, being four stories high, are divided into wards or galleries, two in each story; containing each twenty-six distinct apartments for the foot soldiers. At each of the four corners of the main building, there is a pavilion, in one of which is the governor's lodging, and the council-chamber; the other being lodgings for several of the officers of the house. Before the main building, there are four wings or out-buildings; one for the infirmary, another for several officers of the house, another for old maimed officers of horse and foot; and the fourth for the baler, handmaids, &c. The number of ordinary pensioners is 450, besides the officers and servants in the house: the out or extraordinary pensioners are also very numerous; and these, upon occasion, do duty in the several garrisons, from whence draughts are made for the army, &c. The pensioners are all provided with cloath, diet, washing, lodging, fire, and have one day's pay in every week for spending money.

The qualifications required to be admitted of this body, are, that the candidate bring a certificate from his superior officer, that he has been maimed or disabled in the service of the crown; or that he has served the crown twenty years, which must be made appear by muster-rolls.

To defray the charges of this hospital, there is a considerable sum paid yearly out of the poundage of the army; beside one day's pay of each officer, and each common soldier, every year, which in time of war, amounts to a very considerable sum.

For the annihilation of this hospital there are council-floors, a governor whose salary is 500*l.* per annum, a lieutenant governor with 400*l.* a major with 300*l.* an adjutant with 100*l.* two chaplains with 100*l.* each, a physician and surgeon, whose salaries are 100*l.* each, besides surgeon-mates and apothecaries, &c. &c. who is the pay-master-general of the land-forces, and the time being, and his deputy and clerk, secretary and register and clerk, agent and pay-master to the pensioners and his clerk, comptroller, steward, &c. &c.

HOSPITAL, Sea, or Corporation, was formed for the relief

lie of the aged and necessitous poor of Scotland, within the cities of London and Westminster, and incorporated by charter in 1665, which was confirmed by letters patent of Charles II. in 1666, by the appellation of *The Scots Hospital of King Charles II.* to be governed by eight Scotsmen, who were allowed to elect thirty-three assistants, and to purchase in mortmain 40*l.* per annum, to buy the annual fund mentioned in the first charter. This corporation has, for many years, a hall in Blackfriars, but the business of it is now conducted in the house lately belonging to the Royal Society, in Crane-Court: the officers are a treasurer, register, two stewards, and a beadle; and the sum annually distributed by the society is about 600*l.*

HOSPITAL, Small-Pox, or HOSPITAL for receiving poor people afflicted with the small-pox and for inoculation, was instituted by voluntary subscription in the year 1746. This hospital consists of two houses, at a due distance from each other, in airy situations. The house for preparing patients for inoculation is at Pancras, and that for receiving them when the disease appears, and for accommodating patients who have it in the natural way, is in Cold-bath Fields. The king is the patron of this hospital, and it is under the laborious government of a president, four vice-presidents, a treasurer and a committee of thirteen governors, chosen at general courts, which are held half-yearly. Thirty justices constitute a governor for life, and five guineas per annum a governor during such subscription. Every governor is entitled to have one patient in the house for inoculation, and one in the house for the natural way, at the time these patients in the natural way are received every day, whenever there are vacancies; and those for inoculation are also received every day, provided they come before time in the evening. The hospital is under the medical care of a physician and each house has its apothecary and matron and proper nurses. From the annual state of this hospital, it appears, that there have been received into the house for the natural way, from September 25, 1745 to the 27th of March 1750, 14,733 patients; and there have been inoculated in the same period 18,716.

HOSPITAL, St. Thomas. See CHURCHES.

HOSPITAL, St. Thomas's, in Southwark, is established for the same purposes at that of St. Bartholomew.

It was originally founded in 1213, by Richard prior of Bermonsey, in 1213, and surrendered to king Henry VIII. in 1534, in the year 1551, the mayor and citizens of London, having purchased of king Edward VI. the manor of Southwark, including this hospital, repaired and enlarged it, and admitted into it 250 poor, sick, and helpless objects, wherefore the king in 1553 incorporated it together with those of Christ and St. Dunstons. This ancient structure, much damaged by time and by fire, was rebuilt by voluntary subscription in the year 1663; and by additional building greatly enlarged; in consequence of which it consisted of three beautiful squares; to which the governor, in 1739, added a magnificent new building, consisting of several wards, a brew-house, and other necessary offices in their own expense. It now consists of four quadrangular courts; in the first are wards for women; in the second two wards, the latter for the private use of the hospital, and the larger, parietal; in the same court and adjoining to it, are the houses of the treasurer, and other officers; in the third court are several wards for men; the fourth hall also wards, hot and cold baths, a forgery, theatre, apothecary's shop, &c. The number of patients relieved by this hospital in the year 1750 was 5624; and 3007 in-patients, and 4607 out-patients were discharged cured. The annual disbursements of this hospital are about 8000*l.* the governors of this hospital are the lord mayor and court of aldermen, and the number of others, who on receiving a governor's staff, give a benefaction of 50*l.* or upwards, is unlimited; but it is commonly between four and five hundred. They choose their officers and servants, who are a president, treasurer, hospitalier or chaplain, besides the minister of the parish, who is paid by the hospital, three physicians, three surgeons, apothecary, clerk, receiver, steward, matron, butler and brewer, baker, cook, assistant and servant, an assistant clerk in the counting house, two porters, four boushies, nineteen lifters, nineteen nurses, nineteen watch-women, a chapel clerk and sexton, and one watchman. The house contains at this time eighteen wards and 485 beds.

Besides the hospital already enumerated, there are several others, such as that at Hadley, near Portsmouth, for sick and hurt seamen and mariners, and the royal hospital at Greenwich, and many others, supported by the benevolence of private and voluntary contributors, which provide relief for almost every species of disease or injury.

HOSPITALS, Camp, are either general or regimental. The general hospitals are of two kinds, viz. the flying hospital, attending the camp at some convenient distance, and the stationary hospital, which is fixed to one place.

In the choice of both, it will be better to have them in towns than villages, as the former will admit larger wards, besides more of other conveniences; these wards should be as airy as possible.

As to the disposition of hospitals, in regard to preserving the purity of the air, the best rule is to admit but few patients into each ward. It will also be found a good expedient, when the wards are low, to remove some part of them, and to open the gables only. The doors and windows are likewise to be opened, and ventilators used to purify the air of every ward. In winter-hospitals, the wards are to be warmed with chimneys, and stoves by stoves; but, though the latter may seem a large ward better, and at a less expense, yet by scarce making any draught of air, they will be apt to increase in putrid quality; whereas a fire, kept up in a chimney, acts like a constant ventilator.

The general hospital should receive only such sick as the regimental ones cannot conveniently contain, together with those who cannot be moved with the army. Without this disposition of the sick, the general hospital, in bad seasons, would have a greater number than could be well attended; and what is equally, if not more pernicious, it would be too much crowded, by which means the contagion would spread, and the mortality be rendered more general.

Regimental hospitals are of the greatest importance, and therefore should be supplied with blankets and medicines from the public stores, with an allowance also for nurses and other necessities. Nor are they to be maintained in the field only, but also in winter-quarters, as there will always be a great many more sick than can be taken care of in the general hospital.

Barns, gibbets, graveyards, and other out-houses, but above all, churches, make the best hospitals from the beginning of June to October; but as the greatest danger arises from foul air, which cannot be commodious by dirt or medicine, we may lay it down as a rule, that the mortality and large the hospital are, the less danger there is of the sickness spreading. Fringe, Observ. on the Diseases of the Army, p. 104, 105.

HOSPITAL-FEVER, a name given to the malignant enteric fever, as being frequent in hospitals. See FEVER. Dr. Fringe has given us an elaborate account of the effects, symptoms, and cure of this terrible disease. In his Observations on the Diseases of the Army. It may be owing to a great many concurring causes, but the principal are foul and putrid air, occasioned by filth and impurity of any kind. Hence it is no wonder that it prevails in marshy countries after hot seasons, and in populous cities, especially in low, and ill aired, unprovided with common sewers, or where the streets are narrow and foul, the houses dirty, water scarce, and where jails or hospitals are crowded, and not ventilated and kept clean; when in such times the burials are within the town, and the bodies not laid deep, when slaughter-houses are also within the walls; or when dead animals or offals are left to rot in the kennels, or on dung-hills; when drains are not provided, to carry off any large body of disgusting or corrupted water, in the neighbourhood; when fish-meats make the greatest part of the diet, without a proper mixture of bread, greens, wine, or other fermented liquors; from the use of cold and starchy grain, or what has been damaged by a wet season; or, lastly, when the fibres are relaxed by a moderate warm bathing.

When the disease comes on slowly, the symptoms are small interchanges of heat and cold, trembling of the hands, interrupted sleep, &c. But when it advances fast, the above symptoms are all in a higher degree; and besides these, the patient is afflicted with great lassitude, a nausea, pains in the back, a constant pain and confusion in the head, a dejection of spirits, and an uncommon tremor of the hands. If the sick be warm, and have had no preceding flux, the body is generally collicie; but when they be cold, as they often do in field-hospitals, the pores of the skin being shut, a diarrhoea is a common symptom; in the worst cases, a flux appears in the last stage; when the stools are involuntary, colliquative, ichorous, or bloody, and of a cadaverous smell, which are the effect of a morification of the bowels, and the sign of approaching death; some are never delirious, but all are under a great stupor and confusion. The petechiæ are the frequent, but not infrequent attendants of the fever; they are sometimes of a brighter or paler red, at other times of a livid colour, but are never raised above the skin. For the most part, these spots are so little conspicuous, that unless looked for attentively, they may escape notice. They are thickened on the breast and back, less on the legs and arms, and the Dr. never remembers to have found any upon the face. This fever, though of the continued kind, has often exacerbatings at night, with remissions, and partial sweats next day; and, after a long continuance, is apt to change into a hectic, a remitting, or intermitting form.

Prognosis in it. To have a little delirium, the strength little impaired, turbid urine in the decline of the disease, and at the same time a gentle sweat or moisture diffused over the body, are reckoned good signs; and it seems peculiar to malignant fevers, that delirium is rather a good sign.

Method of cure. This varies according to the state of the disease, which may be distinguished into three periods; the first continuing as long as the patient is able to get about; the second beginning with his confinement; and the third when the pulse sinks and a rigor comes on. In the first, as well as in the other periods, the cure is principally to be aimed at by removing the patient out of the foul air. When this cannot be done, the ward or room should be purified by making a succession of air by means of fans, or letting it in by doors and windows, or dissolving the steam of vinegar.

The next thing to be done, is to promote a diaphoresis, which, in this period, should only be attempted by mild sudorifics, as the spiritus Mindereri.

When the fever is confirmed, contrayerva powders, with nitre, camphor, the common pituita acidulated, and such medicines as are good in inflammatory cases, ought to be given. Conferences is to be prevented by constant clysters. But opiates are dangerous, both in this and the third stage, in which the pulse sinks, and stupor is greater, a stupor impends, and perichne often appears. When this is observed to be the case, the nitre and diaphoretic medicines are to make room for a decoction of snake-root, to which a small quantity of strong water may be added. It may also be given in substance from two to four scruples a day, with sensible good effects. Towards the decline of the fever, an equal quantity of Peruvian bark may be joined with the root. Wine is also an excellent cordial at this period, and may be given either made into whey, or added to the panada, which was the only food allowed to the sick. It may be taken from half a pint to a quart a day, according to the strength of the patient. Perhaps there is no rule of more importance, than to give strict charge to the attendants of the sick, never to let the patient, when lying, remain above two or three hours without using something cordial and nourishing. But however necessary wine, rotatives, and other cordials are, in this low state of the fever, it ought to be remembered, that they must never be given with an intention to force a sweat, but only as antispasmodics, and to support the vitæ.

If there be danger of a pleuritis coming on, it will be proper to call in the assistance of epiploon. Sinapisms too may be used when the pulse is greatly sunk. If a diarrhoea comes on in the decline of the fever, it is to be moderated by adding a few drops of the rhubarb tincture to the full quantity of the alexipharmic decoction; or by giving a spoonful or two of an astringent mixture. In proportion, however, to the purid nature of the stools, astringents are to be used with the more caution. When the fever is over, there are few but complaint of vertigo, and want of rest; a continuation of the delirium, and other nervous symptoms, are frequently the consequences of great labours; in which case, the pilule Martini are to be given at night, with anodynes and medicines of the strengthening kind. Vide Fungii's Observ. on Mistakes of the Army, p. 243. 278.

HOSPITAL SHIP. See SHIP.

HOSPITALIER, one that entertains and provides for poor people, travellers, &c.

The appellation is chiefly given to certain communities of religious; as, the *Hospitaliers* of Elfort in Essex, instituted to take care of lepers; *Hospitaliers* of St. John Baptist, of Coventry; *Hospitaliers* of St. Julian; *Hospitaliers* of St. Leonard at York, &c.

The religious *Hospitaliers* generally follow the rule of St. Augustine. Most of them pretend, that St. Martha was their first foundress, and chose her for their patron, because she entertained Jesus Christ at her house. Some of them go back to the patriarch Abraham for their founder.

There are also *Hospitaliers* among the military orders; such as the knights of St. Lazarus, and St. John of Jerusalem. **HOSPITALIARI,** *HOSPITALIARI,* more particularly denominated in order of religious knights, who built a hospital at Jerusalem, wherein pilgrims were received. To these Pope Clement V. transferred the effects and revenues of the Templars, whom, by a council held at Vienne, he suppressed, for their many and great misdeemeanors. These *Hospitaliers* were otherwise called *Knights of St. John of Jerusalem*; and are the same with those whom we now call *Knights of Malta*.

HOSPITALENS, in *Metaphysics*, is a name which the ancient Romani gave to Jupiter, calling him Jupiter Hospes, because they considered him as the guardian of hospitality. **HOSPITIUM,** *hospiti*, a term, peculiarly used, in our law-books, for an act of civility.

HOSPITIUM is also used for a little convent, which the re-

ligious built for the reception of strangers and travellers, of the same order, who had occasion to stay with them some time.

Most of these *hospitia*, or inns, in time became fixed convents.

HOSPITIUM was likewise formerly used for *PROCURATOR*, or visitation money.

HOSPQAR, the title borne by the princes of Walachia and Moldavia.

The *hospitales* of Walachia and Moldavia receive the investiture of those principalities from the grand seignior, by a veil, and a standard which he gives them.

They are sometimes deposed by him; though in other respects they have sovereign power within their states.

HOST, *Hospes*, which some will have thus called, *quasi hospitium*, or *asylum privatum*; for *asylum* was anciently written with an aspirate; a term of mutual relation, applied both to a person who lodges and entertains another, and to the person thus lodged, &c.

Thus the innkeeper says, he has a good *host*, in speaking of the traveller who lodges with him; and the traveller again says, he has a kind *host*, in speaking of his landlord. It must be observed, then, that it was the custom among the ancients, when any stranger asked for lodging, for the master of the house, and the stranger, each of them to set a foot on each side of the threshold, and swear day would neither of them do any harm to the other. It was this ceremony that raised so much horror against those who violated the law or right of hospitality on either side; inasmuch as they were looked on as perjured. Instead of *hospes*, the ancient Latins called it *hospitium*, as Cicero himself informs us; though, in course of time, *hospitium* came to signify an enemy; so much was the notion of hospitality altered.

HOST is also used by way of abbreviation for *HOSTIA*, a victim, or sacrifice, offered to the Deity.

In this sense *host* is more immediately understood, of the person of the Word incarnate, who was offered up a *host*, or *hostia*, to the Father on the cross, for the sins of mankind.

HOST, or *HOSTIA*, is chiefly used in the Ramoth church for the body of Jesus Christ, contained under the species of bread and wine, which is offered up every day, a new *host*, or sacrifice in the mass.

Pope Gregory IX. first decreed a bell to be rung, as the signal for the people to betake themselves to the adoration of the *host*.

The vessel wherein the *host* is kept, is called the *alms*; being a large kind of covered chalice.

HOSTAGE, formed of *host*, and that of *hospes*, a person left as surety for the performance of the strictest of a treaty.

When two enemies are upon the point of concluding a treaty, or capitulation, it is frequent for them to give *hostages* on each side, as sureties for the execution of what is contained therein.

A *hostage* is either a principal, or an accessory, according to the state of the case. He is only an accessory, when, for instance, a prince promises fidelity to another, and gives up his son, or some other great lord, to assure his engagement, without any further stipulation. For here, if the prince fail of his word, the *hostage* is no ways accountable for it.

But the *hostage* becomes a principal, when it is expressly stipulated, that he shall be answerable for the event: for instance, if a city engage to surrender, in case it be not relieved in so many days, and so secure the engagement, give *hostages*, these *hostages* are what a surety is to a creditor for the debt of his principal. So that, if the relief do not come, and yet the citizens refuse to surrender, the *hostages* stand in their place, become principals, and are liable to be punished for the prevarication of those they are become sureties for.

A *hostage* given for another person becomes free when that person dies.

HOSTEL, or *HOTEL*, a French term, anciently signifying a house, or dwelling place.

It is now more commonly used for the palaces or houses of the king, princes, and great lords.

In this sense they say, the *hotel de Condé*, *hotel de Guise*, *hotel de Lorraine*, &c.

The grand prévôt de l'*hotel* is the first judge of the officers of the king's household. His jurisdiction is much like that of lord-steward of the household of the king of England.

The *hôtel de ville* is what we call a *municipality*, or *town-hall*.

HOTEL-DIEU, is a common name for the *grand hospital* for the reception of sick persons, in most of the cities of France.

The *Hotel de Mari*, is a hospital near Paris; of the same nature with Chelsea hospital.

HOSTIA. *Host*, in *Antiquity*, a victim offered in sacrifice to a deity.

The word is formed from *hostis*, enemy; it being the custom to offer up a sacrifice before they joined battle, to render the gods propitious; or, after the battle was over, to give them thanks. Some choose to derive the word from *hostis*, q. d. *foetis*, & *foetis*. Idione on this word remarks, that the name *hostis* was given to those sacrifices which they offered before they marched to attack an enemy: *Aut quoniam*, says he, *ad hostem properant*, in contradiction from *victims*, which were properly those offered after the victory. Ovid seems to distinguish otherwise, when he says,

Vitima quæ trucidat dextra iuvencis, vocatur;
Hostiam a dextera hostia nomen habet.

As if the *hostia* might be slain by any priest, but the victim only by the hands of the victor. Fronton makes another distinction according to him, *victima* was a grand oblation, and *hostia* a smaller and less considerable one.

HOSIILANA, in *Mythology*, a goddess adored among the Romans, and invoked particularly for the fertility of the earth.

HOSTILITY, the action of an enemy. During a truce, all *hostilities* are to cease on both sides: such a city stands neutral, and commits no *hostilities* on either side.

The word is Latin, *hostilis*, formed of the primitive *hostis*, which signifies enemy; and which anciently signified stranger, *supra*.

HOSTILLERS, in our *Old Writers*, is used for inn-keepers; and in some old books the word *hostlers* is taken in the same sense. 31 Ed. III. cap. 2.

The word is French, *hostliers*, of the same import.

HOSTIS, in *Antiquity*. See **BISHOP**.

HOT-bath. See **BATH**, and **DIETARY**.

HOT-bed, in *Gardening*, a bed of earth sheltered from the cold air, and heated by means of a sufficient quantity of fresh horse-dung, or tanner's bark, &c. laid underneath it. Its use is to forward the growth of plants before the natural season, or to force vegetation, where the climate is not sufficiently warm for the particular occasion.

By means of *hot-beds*, skillfully managed, we can so nearly imitate the temperature of other climates, that seeds of plants brought from any country between the tropics, may be made to flourish even under the poles.

Hot-beds are of general use in the northern parts of Europe, without which we could not enjoy so many of the products of the warmer climes as we now do, nor have our tables furnished with the various products of the summer so early in the spring.

The common *hot-bed*, used in kitchen-gardens, are made with horse-dung, in the following manner: a large quantity of new dung from the stable, with the litter among it, should be mixed with some sea-coal ashes; and when it has stood a week, it should be turned over, and the parts should be well mixed together: in this state it may continue live or six days longer, and it will then have acquired a considerable heat. This dung is then to be placed in a shallow trench, made in a sheltered part of the garden, and dug about a foot or a foot and a half deep, if the ground be dry; but if it be wet, not above six inches: the dung must then be laid exactly smooth and even; and the lower part of the heap, which is commonly free from litter, should be scattered over the surface of the bed; or the heat may be prevented from rising, and the mould from burning, by spreading a layer of neat's dung over the surface of the horse-dung. If the bed be intended for the planting out of *MELONS* or *CUCUMBERS*, there must be made, at proper distances, where the middle of the light of the glass they are to be covered with will come, holes of ten inches over, and six deep, which must be filled up with fresh earth, thrusting a stick in the middle, to show the place where the hole is. The whole bed is then to be covered about four inches thick with the earth taken out of the trench. When this is done, the beds are to be covered with frames of wood, fitted with lights of glass, and after about two days the earth will be of a proper degree of warmth to receive the plants to be set in it.

In the making these beds, great care must be taken to lay the dung close and even; and if it be full of long litter it should be trod down, otherwise it will heat too violently, and the warmth be soon dissipated. For the first week or ten days the glasses must be but slightly covered in the night, and in the day-time carefully raised to let out the steam, which is subject to rise very copiously while the dung is fresh. Afterwards the covering must be increased; and if the bed cools too fast, new dung must be laid about its sides, which will give it a great warmth throughout; and by that time this is dissipated, the sun's rays will have power enough to supply the place of artificial heat. Only, at this time, if the nights happen to be cold, as is indeed often the case, it will be necessary to lay some mowings of grass about the sides of the bed.

Vol. II. N^o 176.

This is the sort of *hot-bed* most in use in kitchen-gardens; but those made with tanner's bark are much more proper for the tender exotic plants and fruits, which require a steady and equal degree of warmth to be kept up for several months. In order to the making of these, a trench must be dug in the earth, about three feet deep, if the soil be dry; but if it be wet, it must be only dug one foot, and the bed raised two feet above ground. The length must be proportioned to the number of frames it is intended to be covered with; but it should never be less than eleven or twelve feet, nor its breadth less than six, in order to admit a body of bark sufficient to keep up the heat. This trench is to be bricked up to the height above mentioned, and in the facing should be filled with fresh tanner's bark, that is, such as the tanners have lately drawn out of their vats, after having tanned leather with it. This should be laid in a round heap for a week or ten days before it is put into the trench, that the moisture may run off; it is then to be put into the trench, and gently beat down with a dung-fork; it must then be covered with a wooden frame and glass, and in about ten days or a fortnight it will begin to bear, and is then fit to have the pots of plants and seeds plunged into it.

A bed of this kind will continue in a good temper of warmth for two or three months; and when the heat declines, if it be stirred up thoroughly from the bottom with a fork, and a load or two of fresh bark added to it, will recover its heat, and keep it for two or three months longer.

The frames that cover these beds should be proportioned to the plants they are to contain; if for the *PINK-APPLE*, the back should be three feet high, and the lower part fifteen inches, in order to drain off the wet. If the bed be intended for taller plants, the frame must be higher in proportion; but if designed only for sowing of seeds, it need not be more than fourteen inches high at the back and about seven inches deep at the front. Miller.

In Holland they make use of *hot-beds* made of sand; which are not so apt to raise unwholesome damps, as those of horse-dung.

Bradley, with very good reason, proposes a thermometer to be used to regulate the heat of *hot-beds*. For plants that are either to be brought up in a colder season or colder climate than what they naturally require, you are to take the height at which the thermometer stands in their proper season, or climate, as a standard; and by applying a thermometer to the *hot-bed*, judge whether the heat is to be increased, or remitted. Thus, a *hot-bed* for cucumbers must be kept, to raise the spirit in the glass to the same height as the natural temperature of the weather will raise it to, about the latter end of May and June, when cucumbers will grow abroad, without any artificial heat or shelter.

HOT-house. See **STOVE**, and **HYPOCAUSTUM**.

HOT-house, in the *Salt Works*, the place where they dry the salt after it is taken out of the boiling-pan. In the Cheshire salt-works, this is situated between the furnace and the funnels of the chimney which convey up the smoke. Along the floor of this room there run two funnels, nearly in a horizontal direction. From the furnace, after this course along the floor, they rise perpendicularly. In these the flame and smoke running along, heat the room by the way.

HOT-house, or **HOTHOUSE**, a sort of factitious, or compound fire, made of a third part of any coal, pit, sea, or charcoal, mixed with two thirds of loam.

These ingredients are to be made up into balls, moistened with a little urine, round, or in any other form, at pleasure, and exposed to the air till thoroughly dry; then may they be built in the most orderly fire imaginable, affording a glowing, regular, and constant heat, for seven or eight hours, without stirring. This mixture is also used in some parts to slacken the impetuous denting of the fire, and keep coals from consuming too fast.

HOTAMBURGA, in *Zoology*, the name of a species of serpent found in the East Indies, of a greyish-yellow colour, and very rank flesh.

HOTCH-POTCH, or **HONCH-PONCH**, from the French *haché* in *pots*, or, according to Camden, *haché* as *pot*, i. e. *haché* in a *pot*, primarily denotes a Flemish medley dish, made of flesh cut in pieces, and sodden with herbs, roots, &c.

HOTCH-POT, in *Law*, signifies a mixture or blending of lands, given in marriage, with other lands in fee accruing by descent. Thus, a man seized of thirty acres of land in fee, hath two daughters, and gives with one of them ten acres in frank-marriage, and dies seized of the other twenty. If now, the daughter thus married will have any part of the twenty acres, the must put her lands given in frank-marriage in *hotch-pot*, that is, the must refuse to take the sole profits of the ten acres, but suffer them to be mingled with the other twenty, so that an equal

equal division may be made of the whole thirty between her and her sister. Thus, for her ten acres she will be entitled to fifteen. *See* *Lot*.

HO-TTONIA, in *Botany*. *See* *Water Violet*.

HOTTENTOT cherry, in *Botany*. *See* *CHERRY*.

HOTTIS, or **HUTTS**, pounces, and round balls of leather stuffed or tied on the sharp ends of fighting-cocks spurs, to keep them from hurting one another in *SPARRING*, or breathing themselves.

HOVEL, a covering or shelter for cattle, made of hurdles or the like, or any other mean building.

HOVELLING, in *Architecture*, is a method of working up the sides of a chimney, and covering the top with tiles or bricks, set up in a pyramidal form, so that the smoke may escape below the current, when the wind makes over the chimney, or against any one side of it. This is used to prevent the inconvenience arising from adjoining buildings higher than the chimney, or from its being in the eddy of any very lofty building, or in the vicinity of high trees: the covered side most in this case be kept towards the building which occasions the inconvenience.

HOVEN is the name of a disease incident to horned cattle, on eating too greedily of green clover. This disease consists of a swelling of the paunch, which, without speedy relief, proves fatal. The surest and speediest method of relief is that of making an incision into the paunch of the beast, by which means the wind, that caused the swelling, will escape through the orifice, and the animal recover. This operation is performed with a penknife, the blade of which should be pushed in, till wind be perceived to issue out; the blade may be five inches long, sharp at the point, but enlarged and rounded off at the edges towards the flank, and penetrated quite to the hilt. The wounds thus made should not be sown up, as they will soon heal, provided that the knife does not penetrate too near the hip-bone: it is therefore proper to feel for the short ribs before the puncture is made, and to pass the knife as near the centre as possible between these ribs and the hip-bone. It is also advisable, as soon as the beast is relieved of his wind, to throw up a proper cypher, as hot as he can bear it.

HOUGH and **HOUGHING**, in *Gardening*. *See* *Hoe* and *HOKING*.

HOUGH, *Ham*, in the *Anatomy*, the joint of the hind-leg of a beast, which connects the thigh to the leg. *See* *HAM*.

To HOUGH, or *cut the houghs*, is to ham-string, or to dislocate by cutting the sinews of the ham.

HOUGH, *lump*, is a hard, round swelling, or tumor, growing upon the hip or elbow of the *hough*.

It generally proceeds from some stroke or bruise; and if neglected till the substance of the swelling becomes hard, like glue, it proves difficult to cure.

HOUND, *canis caninus*, a hunting dog. *See* *CANIS* and *DOG*.

Hounds may be distinguished, with regard to the manner of their hunting, into such as find out and pursue the game by sight, and the quickness and swiftness of their motion; of which kind are the *grey-hound*, *grey-flew*, and *grey-hound*, *canis græius*; the *terrier*, &c. and those which find and pursue the game by the goodness of their smell.

The species of scenting-dogs may be divided farther; into *hounds*, simply so called, and *blood-hounds*; each whereof admits of some diversities.

1. As to *hounds*, simply so called, those which are all of one colour, as white, black, &c. are most valued; then those spotted with red; the white with black ears, and a black spot at the setting on of the tail, are generally esteemed the best for composing a kennel, and are of the best scent and condition; those spotted with dun are less prized, as usually wanting courage and boldness. The black-tailed, or the all liver-colored, or all white, the grey talbots, are best for the firing or line; and the grizzled, whether mixed or unmixed, if their hairs are shaggy, are usually the best runners. There should always be a couple of these in the pack. *Fellow-hounds* are of good scent, and hardy, not fearing the water; they keep the chase well, without change; but are not so swift as the white; they love the hart above any other chase, having little stomach for the hare, &c. whence they are not fit for private gentlemen; beside that, they are apt to run at tame beasts.

The *fox-hounds* are of a more general use, being fit for all chases. Their capacity and fidelity in knowing and sticking to their master's voice and horn, and to none else, are much admired; they also understand each other, and know which are hobbles, which hares, &c. They are of different sizes and qualities in the several countries, &c. Mountainous and woodland parts breed a tall heavy sort, called *fox-hounds*; moderate folk, where the

champaign and covert share pretty equally, produce a middle-sized *hound* of a humber make.

The marks of a good and fair *hound* are to be of a middle proportion, rather long than round, the nostrils wide, back bowed, fillers great, haunches large, ham straight, tail big near the reins, and the rest flatter towards the end, the leg big, the fore-try, and claws large. For the terms used in respect of *hound*, their nooses, &c. *see* *HUNTING*.

Nothing is more essential to the having a good pack of *hounds*, than a proper care of the whelps, and of the parents from which they are to be bred.

The bitches, in particular, should be carefully chosen, and should be such as are the strongest and best proportioned; they must also have large ribs and flanks.

The best season for the coupling of *hounds* is in January, February or March; for then they will litter in a good time of the year, that is, in spring; so that they will be fit to enter in due course without loss of time, or of the season; for if bitches litter in winter, it is very difficult to bring up the whelps, the cold killing them if there is not great care taken of them.

The first litter that the bitches must not be above five years old; for if they are older than this, the young ones will be dull and heavy. Care should be taken to have a proper dog ready the first time of the bitch's going proud; for it is affirmed by many, who say they have experience for it, that whatever kind of dog licks a bitch the first time, there will be one puppy at least in all her succeeding litters that will have some resemblance of him.

The first litter of puppies that a bitch brings, are never esteemed so good as the second or third. When a bitch has been lined, and grows big with whelps, she is not to be suffered to hunt among the pack, nor to take any other violent exercise; for that would endanger her casting her whelps; the flannels be kept up, and fed well, and a good place should be provided for her to litter in.

As soon as the whelps are born, those which are intended to be kept should be selected out, and the rest immediately drowned. There is great difficulty in choosing the best at this early time; but the general opinion gives it to those which are the lightest; that they will be the swiftest and best as they grow up.

Others take all the whelps away; and having determined what number they will keep, they bring the choice on those which the bitch carries back first to the place where she littered. But all this seems very uncertain. Others select that which was pupped last.

The whelps must have good fresh straw to lie on, and it must be often changed. They are to be kept in a place where neither the rain nor sun-famine can be troublesome to them; and once a week it will be proper to anoint them all over with a little nut-milk, with some tallow infused in it. This will prevent the flies from annoying them so much as they otherwise would, and will kill worms of all kinds. When they are fifteen days old, it is the custom to worm them, and a week after one joint of their legs should be twisted off. As soon as they can see, they should have milk given them to lap; and at two months old they must be weaned, keeping them wholly from the bitch; they must at this time be well kept, but not too high fed; and it is proper to put some cummin seed into their food, to keep the wind out of their bellies.

Many let the whelps of their hounds suck three months, and then send them away to villages to be bred up till they are ten months old, cautioning those people who have the care of them, not to let them eat carrion, nor frequent warrens.

Rye-bread is a very common food for young *hounds*, and is particularly recommended by many, but wrongly; for it soon passes through them, and gives them very little nourishment. When they are fed constantly with this, in the time of their growing up, they always become narrow-backed; and this is a great fault in this sort of dog; a broad back being one of the greatest recommendations in a *hound*. Wheat-bread is greatly preferable on all accounts for the food of the young *hounds*, giving him strength and frame.

At ten months old they are to be taken notice, and put into the company of the others, to live as they may; and after a few weeks keeping company with the rest, they are to be coupled, and to go out to hunt.

For the method of entering young *hounds*, *see* *ENTERING*.

It ought to be noted, that whatever young *hounds* are put entered at, and if rewarded with, they will ever afterwards maintain; so that if they are intended, a good *hound* they must not be entered at the hare.

2. The *grey-hound*, or *lypharion*, or *canis græius*, might deserve the first place, on account of his swiftness, strength, and fidelity, in pursuing his prey.

fuch bring the nature of this dog, that he is speedy and quick of foot to follow, fierce and strong to overcome, yet silent, coming upon his prey unawares.

Dr. Caius derives the name of the *greyhound*, or *greyhound*, from its being the first in rank among dogs; and that it was formerly so esteemed, appears from the fore-laws of king Canute, who enacted, that no one under the degree of a gentleman should presume to keep a *greyhound*. The varieties of this species are the *Italian greyhound*, which is small and smooth, and the *Oriental*, which is tall and slender, with very pendulous ears, and very long tails on the tail, hanging down a great length.

There was formerly a variety, called the *Highland greyhound*, which is now become very scarce, of a very great size, strong, deep chelled, and covered with long and strong hair.

The make and proportions required in a good *greyhound* are, that he have a long body, strong, and pretty large, a neat sharp head, sparkling eyes, a long mouth, and sharp teeth, little ears, with thin gristles in them, a straight, broad, and strong breast, his fore-legs straight and short, his hind-legs long and straight, broad shoulders, round ribs, flthy buttocks, but not fat, and a long tail, strong and full of sinews.

Of this kind, those are always fittest to be chosen among the whelps that weigh lightest, for they will be sooner at the game, and so hang upon it, hindering its pursuit, till the heavier and stronger breed come in to offer their assistance; whence, besides what has been already said, it is requisite for a *greyhound* to have large sides, and a broad midriff, that he may take his breath in and out the more easily; his belly should also be small, which otherwise would obstruct the swiftness of his course; and his hairs thin and soft.

The huntsman is to lead these *hounds* on his left hand, if he be on foot; and on the right, if on horseback. The best time to try and train them to the game, is at twelve months old, though some begin sooner, with the males at ten, and the females at eight months old, which fall are said to be generally more swift than the dogs; they should be kept in a ship, while abroad, till they see their course; neither should you loosen a young dog till the game has been a considerable time on foot, as he is apt, by over eagerness at the prey, to strain his limbs.

The *greyhound* is the best used in open countries where there is little cover; in these places there will sometimes be a course after a hare of two miles or more, and both the dogs and the game in sight all the while. It is generally supposed, that the *greyhound* bitch will beat the dog in running; but this seems to be an error, for the dog is both larger made, and considerably stronger than the bitch of the same kind. In the breeding of these dogs the bitch is principally to be regarded; for it is found by experience, that the best dog, with a bad bitch, will not get good puppies as an indifferent dog with a good bitch. The dog and bitch should be as nearly as can be of the same age; and for the breeding of perfect and fine dogs, they should not be more than four years old; an old bitch may be used with a young dog, but the puppies of a young bitch and an old dog will never be good for any thing.

The general food of a *greyhound* ought to be chippings or raspings of bread, with soft bones and gristles; and these chippings ought always to be soaked in beef or mutton-broth; and when it is nearly cool, some milk should be added; this given the dog morning and evening will keep him in good heart and spirits; he must never have any hard bones given him, because they harden his mouth, and hurt his teeth. If the dog grows sick and weakly upon this diet, then take sheep's heads with the wool on, wash them clean, and boil them in a sufficient quantity of water, to make a very rich and strong soup, and add a large quantity of oat-meal to it. When the meat is very tender, and the broth rich, it is good and fit for the dog; and giving him sometimes the one, and sometimes the other, will very soon recover him.

If one of these dogs is to run for a wager, or on any particular occasion, he may be dieted with the following bread: take half a peck of good wheat, and the same quantity of the finest and driest oat-meal; grind these together, and let the meal be sifted very fine; then add as much liquorice and unloosed, in powder, as will not give it too disagreeable a flavour; and knead the whole into dough with the whites of eggs. This should be baked in small loaves considerably hard; and when the dog is to be fed with it, it is to be soaked in beef or other broth. He is to be led out to walk half an hour after sun-rise every morning, and half an hour before sun-set every evening, and at his coming in fed with this soaked bread. The proper exercise for a *greyhound* is the coursing him three times a week, and rewarding him with blood, which will animate him in the highest degree, and encourage

him to prosecute his game. But the hare also should ever have fair play; he should have the law, as it is called, that is, have leave to run twelve score yards before the dog is slipped at her; that he may have some difficulty in the course, and not pick up the game too easily. If he kill the hare he must never be suffered to tear her, but the mull be taken from him, his mouth cleaned of the wool, and the liver and lights given him by way of encouragement. Then he is to be led home, and his feet are to be washed with butter and beer, and about an hour after he is to be fed.

When the dog is to be taken out to course, he should have nothing in the morning but a toast and butter, and then he is to be kennelled till taken out to the field. The kennelling these dogs is of great use, always giving them spirit and nimbleness when they are let loose; and the best way of managing a true *greyhound* is never to let him stir out of the kennel, except at the times of feeding, walking, or coursing.

3. The *black-hound*, or *black*, is a dog more beholden to the sharpness of his sight than his nose, or smelling; by virtue of which he makes excellent sport with the deer and hare. He is also noted as exquisite in choosing of one that is not lank or lean, but full, fat, and round, which, if it happen to return, and be mingled again with the residue of the herd, he will soon fly out, and leave the rest untouched, never ceasing, after he is separated from its company, and till he has wearied it to death. These dogs were much used in the North of England, and on champion grounds, rather than bushy and woody places, and by boldness, more than foremen. If at any time he happen to take a wrong way, upon the usual sign made by his master, he immediately returns, takes the right and ready course, beginning his chase afresh, with a clear voice, and swift foot, following the game with a much courage as at first.

This species, which was the *apud* of Dr. Caius, says Mr. Pennant, is now lost, or at least unknown to us; and it is very different from the *apud* of Oppian, which is our *beagle*.

4. The *black-hound*, or *canis lupus* of Linnæus, differs nothing in quality from the *Scythia* *black-hound*, derived from the Saxon *fat*, the impression which a deer leaves of its foot in the mire, and *hund*, a dog, saying that it is longer-flapped, and not always of the same colour, but sometimes red, fawn, black, white-spotted, &c. though most commonly either brown or red.

His nature is, that being set on by the voice and words of their leader, to call about for the fitting of the present game, and having found it, they will never cease pursuing it with full cry, till it be tired, without changing for any other.

They seldom bark, except in their chase, and are very obedient and attentive to the voice of their leader. Those that are really good, when they have found the hare, make them thereof to the huntsman by running more speedily, and with gesture of head, eyes, ears, and tail, winding to the form or hare's noise, never giving over prosecution, and running with a gallant noise.

They have good and hard feet, and lately stomachs, and are very properly denominated *argus* or *black-hounds*, on account of their extraordinary scent; for if their game be only wounded, so that it escape the huntsman's hands, or if it be killed, and never to cleanly carried away, these dogs, by their exquisite smell, will discover it, and not be wanting, either by umbleness or greediness, to come at it, provided there be any flains of blood. Nay, though by all the cunning and foresight imaginable, a beast be conveyed away without spot or blood, yet through the roughness and moist crooked ways and meanders, this dog will find out the deer-dealer, and, even in the thickest thorns, will, by his smell, separate and pick him out.

The *black-hound* was in great request on the confines of England and Scotland, where the borderers were continually preying on the kents and flocks of their neighbours. The true *black-hound*, says Mr. Pennant, was large, strong, muscular, broad-breasted, of a fawn countenance, of a deep tan-colour, and generally marked with a black spot above each eye.

5. The *terrier* or *terrier*, only hunts the fox or badger; being thus called, because, after the manner of a terrier in searching for conies, he leaps into the ground, and affrights or attacks the beasts, either tearing them in pieces, or halting them out by force; or, at least, driving them out of their harbours to be taken in a net, or otherwise.

The huntsmen have commonly a couple of *terriers*, that they may put in a fresh one, as occasion serves, to relieve the other.

The time of entering the *terrier* is when he is near a twelvemonth old: if it be not done within that time, he will

will hardly be brought to take the earth. This entering and fetching of them may be performed several ways. First, when the foxes and badgers have young cubs, take an old *terrier*, let him into the ground, and when he begins to bay, hold the young one at the hole or mouth of the earth, that he may listen and hear the old one's bay. The old fox or badger being taken, so that nothing remains within but the cubs, couple up the old ones, and put in the young in their beds, encouraging them by crying, *to him, to him*. If they take any cub within, let them do with it what they list; not forgetting to give the old *terriers* their reward, which is blood and livers, fried with clove, and some of their grease; showing them also heads and skins to encourage them.

HOUNS-FISH, in *fishes*, an English name given to two different fish of the *qualus* kind, the one called the smooth, and the other the prickly *hound*. See *GALEUS latus*, and *GALEUS spinosus*.

We find in Wallingby, and almost all the other writers on fishes, the name of another species of *hound-fish* beside these, called the *flurry hound*, or *yellow spotted*, and *MUSTELUS adriaticus*, or *adriaticus*; but this has been found by Artedi to be no other than a variety of the first species, or smooth *hound-fish*.

There is also another fish of the *qualus* kind, sometimes called by this name, with the addition of the epithet rough. This is the *mergus*, or rough *hound-fish*. It is the *pois gata* of the Italians, the *cataius minor* of authors, and the *mustelus stellatus tertius*, or the third species of *flurry hound-fish* of Bellonius. Artedi distinguishes it from the others, and from all the other *quali*, by the name of the *qualus* with a variegated back, and with the belly-fins concentered together. See *SQUALUS* and *CATULUS*.

HOUNDS-TONGUE, *cyathifolius*, in *Ditany*, a genus of the *pentandria monogamia* class. Its characters are these: it has a funnel-shaped flower of one leaf, with a long tube, and has five short filamina in the chaps of the petal; at the bottom of the tube are situated four germinia; and the empalement afterwards becomes four capsules, including four oval seeds. There are eight species. Miller.

The common *hound's tongue* is easily known by the whitish colour, and softness of its leaves, the beautiful purple of its flowers, and its disagreeable smell. It is an excellent remedy in catarrhs, and will alone often cure a gonorrhea simplex. The root is the part in which its virtues principally reside. Externally it is used as a vulnerary, and it is said to cure even in feropulous cases. See *CYNODONTIS radix*.

HOUNDS, in a *ship*, are those parts of a small-head, which gradually project on the right and left side, beyond the cylindrical or conical surface, which it preserves from the partners towards. The *hounds*, whole upper parts are also called cheeks, are used as shoulders to support the frame of the top, together with the top-mast and rigging of the lower mast.

HOUR, *hora*, in *Chronology*, an aliquot part of a natural day, usually a 24th, sometimes a 12th.

The origin of the word *hour*, or *æra*, comes, according to some authors, from a surname of the sun, the father of *hours*, whom the Egyptians call *Horus*. Others derive it from the Greek *hōra*, *to terminate, distinguish*, &c. Others from the word *horis*, *to rise*; pretending that Trismegistus was the first that settled the division of *hours*; which he did from observation of an animal consecrated to Serapis, named the *canephorus*, which makes water twelve times a day, and as often in the night, at equal intervals.

An *hour* with us is a measure or quantity of time, equal to a twenty-fourth part of the natural day, or *nocturneron*; so it is the duration of the twenty-fourth part of the earth's diurnal rotation. Fifteen degrees of the equator answer to an *hour*; though not precisely, but near enough for common use.

The *hour* is divided into sixty minutes, the minute into sixty seconds, &c.

The division of the day into *hours* is very ancient; as is shown by Kircher, *Oedip. Aegypt. rom. ii. part ii. chap. vi. cap. 2*, though the passages he quotes from Scripture do not prove it. The most ancient *hour* is that of the twelfth part of the day. Herodotus, lib. ii. observes, that the Greeks learnt from the Egyptians, among other things, the method of dividing the day into twelve parts.

The astronomers of Calvary, &c. bishop Beveridge observes, still retain this division. They call the *hour chet*; and to each of these they give a peculiar name, taken from some animal: the first is called *æthi*, *mouse*; the second *chis*, *bullock*; the third *æm*, *leopard*; the fourth *æm*, *hour*; the fifth *chis*, the *crocodile*, &c.

The division of the day into twenty-four *hours* was not

known to the Romans before the Punic war. Till that time they only regulated their days by the rising and setting of the sun.

They divided the twelve *hours* of their day into four; viz. *prima*, which commenced at six o'clock, *third* at nine, *fourth* at twelve, and *none* at three. They also divided the night into four watches, each containing three *hours*. There are divers kinds of *hours*, used by chronologists, astronomers, dialists, &c. Sometimes,

Hours are divided into equal and unequal.

HOURS, equal, are the twenty-fourth parts of a day and night precisely; that is, the time wherein the fifteen degrees of the equator mount above the horizon.

These are also called *equinoctial hours*, because measured on the equinoctial; and *astronomical*, because used by astronomers.

They are also differently denominated, according to the manner of accounting them in different countries.

HOURS, *astronomical*, are equal *hours*, reckoned from noon, or mid-day, in a continued series of twenty-four.

Hours, *Barbican*, are equal *hours*, reckoned from sunrise in a continued series of twenty-four.

Hours, *Evening*, are equal *hours*, reckoned from midnight, twelve from thence till noon, and from noon till midnight twelve more.

Hours, *Twelfth*, or *planetary*, or *senior*, are twelfth parts of the artificial day and night.

Hence, as it is only in the time of the equinoxes that the artificial day is equal to the night, it is then only that the *hours* of the day are equal to those of the night; at other times they will be always either increasing or decreasing.

They are called *senior* or *Twelfth hours*, because used by the ancients, and still among the Jews. They are called *planetary hours*, because the astrologers pretend, that a new planet comes to predominate every *hour*; and that the day takes its denomination from that which predominates the first *hour* thereof: as Monday from the moon, &c.

Hours, *Junior*, are equal *hours*, reckoned from sunset, in a continued series of twenty-four.

Hours, *unequal*, or *temporal*, are twelfth parts of the artificial day and night. The obliquity of the sphere renders these more or less unequal at different times; so that they only agree with the equal *hours* at the times of the equinoxes.

To find the *hour* of the day, when the latitude of the place, the sun's declination, and his altitude, are given. Thus, suppose the latitude is $51^{\circ} 32'$, the sun's declination 18° north, and his altitude 40° , to find the *hour* of the day.

The geometrical solution of this problem is performed by projecting stereographically on the plane of the meridian the oblique-angled spherical triangle, which is made by the complement of the latitude, the complement of the sun's altitude, and the sun's distance from the elevated pole. Thus, with the chord of 60° (*Tab. III. Astron. fig. 80.*) draw the primitive circle *ZONH*; quater it; also draw the axis *PCP* through the poles; and the equinoctial *ECQ*; likewise the parallel of declination *DO* equal 18° ; then draw parallel to the horizon *HO*, the almucantar or parallel of the sun's altitude $\Lambda = 40^{\circ}$, to cut the parallel of the sun's declination in *O* the place of the sun at that time. Then through *O* draw two great circles, one through *Z* and *N* the poles of the horizon, and the other through *P* and *P* the poles of the equinoctial, as *ZON*, and *PON*; which form the oblique-angled spherical triangle *PZO*, and the angle *ZPO*, measured on the line of half tangents, gives the *hour* of the day from twelve, viz. $47^{\circ} 20'$ equal to 3 *hours* 9 minutes nearly, or to 31 minutes after eight in the morning, or 31 minutes before four in the afternoon. But by spherical trigonometry, having three sides given, that is *ZP* $38^{\circ} 25'$ the complement of the latitude, *ZO* $50^{\circ} 00'$ the complement of the sun's altitude, and *PO* $79^{\circ} 00'$ the sun's distance from the elevated pole (which is the declination added to 90° , when the latitude and declination are of a contrary name; but if of one name, it is the complement of the declination); and the angle *ZPO* of the *hour* of the day, is found by calc. 11. of spherical trigonometry, as follows.

First add the complement of the sun's distance from the elevated pole, into one sum. Secondly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Thirdly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fourthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fifthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Sixthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Seventhly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Eighthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Ninthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Tenthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Eleventhly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Twelfthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Thirteenthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fourteenthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fifteenthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Sixteenthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Seventeenthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Eighteenthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Nineteenthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Twentiethly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Twenty-firstly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Twenty-secondly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Twenty-thirdly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Twenty-fourthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Twenty-fifthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Twenty-sixthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Twenty-seventhly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Twenty-eighthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Twenty-ninthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Thirtiethly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Thirty-firstly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Thirty-secondly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Thirty-thirdly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Thirty-fourthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Thirty-fifthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Thirty-sixthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Thirty-seventhly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Thirty-eighthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Thirty-ninthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fortiethly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Forty-firstly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Forty-secondly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Forty-thirdly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Forty-fourthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Forty-fifthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Forty-sixthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Forty-seventhly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Forty-eighthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Forty-ninthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fiftiethly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fifty-firstly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fifty-secondly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fifty-thirdly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fifty-fourthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fifty-fifthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fifty-sixthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fifty-seventhly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fifty-eighthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Fifty-ninthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Sixtiethly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Sixty-firstly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Sixty-secondly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Sixty-thirdly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Sixty-fourthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Sixty-fifthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Sixty-sixthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Sixty-seventhly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Sixty-eighthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Sixty-ninthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Seventiethly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Seventy-firstly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Seventy-secondly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Seventy-thirdly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Seventy-fourthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Seventy-fifthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Seventy-sixthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Seventy-seventhly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Seventy-eighthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Seventy-ninthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Eightiethly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Eighty-firstly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Eighty-secondly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Eighty-thirdly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Eighty-fourthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Eighty-fifthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Eighty-sixthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Eighty-seventhly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Eighty-eighthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Eighty-ninthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Ninetiethly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Ninety-firstly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Ninety-secondly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Ninety-thirdly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Ninety-fourthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Ninety-fifthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Ninety-sixthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Ninety-seventhly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Ninety-eighthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. Ninety-ninthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum. One hundredthly, take from this sum the complement of the sun's altitude, and the remainder is the complement of the sun's altitude, and the sun's distance from the elevated pole, into one sum.

Side	2 P. Dec. lat. 38° 28'	containing sides 75 to 40-40466	2. 20. 40-40466
	3 P. Dec. lat. 28° 00'	half sine sides 57 to 4-9-17750	3. 20. 4-9-17750
	4 P. Dec. lat. 28° 00'	remainder 28° to 4-9-17750	4. 20. 4-9-17750
	Sum 115° 28'	6m of the 4-19-21782	5. 20. 4-19-21782
	Half 57° 54'	End half sine 40-40466	6. 20. 40-40466
	Co. side 57° 54'	60° 30'	7. 20. 60° 30'
	Remainder 57° 54'	60° 30'	8. 20. 60° 30'

Which doubled gives 115° 40'

This subtracted from 180° 00' leaves 47° 20' equal to 2 hours & nearly, the same as before.
By the same operation you may find the sun's azimuth PZQ, if instead of the complement of the sun's altitude you subtract the sun's distance from the pole, noting the half sum and remainder as before. And the rule will stand thus: To the complement arithmetical of the sine of the complement of the latitude, and complement of the sun's altitude, add the sine of the arc of half sum and remainder; then the sine of half the total of these four, doubled, and taken from 180 degrees, gives the sun's azimuth from the north, in north latitude; and from the south, in south latitude.

If the hour of the night is required, the height of some star must be taken. And it is found by adding to, or subtracting the right ascension of that star from that of the sun.

To find the hour of the day or night by the globe, see GLOBE.

HOURS, HORA, in the *Ancient Mythology*, were certain goddesses, the daughters of Jupiter and Themis; at first only three in number, Eunoia, Dice, and Irene; to which were afterwards added two more, Carpo, and Thallo.

Homer makes them the door-keepers of heaven. Ovid allots them the employment of harnelling the horses of the sun:

Junges equis Titum tabulis imparet Horia.

And speaks of them as standing, at equal distances, about the throne of Sol:

— celsi, regis spatium equalibus, Hora.

The poets represent them as dressed in fine coloured or concoloured robes, and gliding on with a quick and easy motion. Ovid. *Fast.* v. *ver.* 218. *Met.* ii. *ver.* 119. *Stat. Theb.* iii. *ver.* 410.

HOURS, HORA, in the *Romish Church*, are certain prayers performed at stated times of the day; as *matins, vespers, lauds*, &c.

The lesser hours, are *prime, tierce, sixth, and none*. They are called hours, or canonical hours, as being to be rehearsed at certain hours prescribed by the canons of that church, in commemoration of the myrieries accomplished at these hours. These hours were anciently also called *canon, curia*. P. Mabillon has a dissertation on them, entitled, *De Curia Galicana*.

The first constitution enjoining the observation of the canonical hours, is of the ninth century, being found in a capitular of Heito, bishop of Basel, directed to his curates, importing, that the priests shall never be absent at the canonical hours, either by day or night.

HOURS, PRAYERS OF, are public prayers continued for the space of three days successively, and without intermission, before the holy sacrament, to obtain the assistance of heaven on some important occasion.

In these days, care is taken, that the holy sacrament be exposed forty hours, viz. thirteen or fourteen hours each day.

HOUR-LINES, or Horary circles, in *Astronomy*, &c. are great circles, meeting in the poles of the world, and crossing the equinoctial at right angles; the same as *meridians*.

They are supposed to be drawn through every fifteenth degree of the equinoctial and equator, and on both globes are supplied by the meridian hour-circles and index. See GLOBE.

The planes of the hour-circles are perpendicular to the plane of the equinoctial, which they divide into twenty-four equal parts.

HOUR-GLASS, a popular kind of chronometer or clepsydra, serving to measure the flux of time, by the descent or running of sand out of one glass vessel into another.

The best hour-glasses are those, which instead of sand have egg-shells well dried in the oven, then beaten fine and sifted.

Hour-glasses are much used at sea, for reckoning, &c. and are also a sort of hour-glasses, which depend on the flux of water, or some other liquid, more properly called *clepsydres*. See CLEPSYDRA.

HOUR-LINES, or Dial, are lines which arise from the intersections of the plane of the dial, with the several planes of the hour-circles of the sphere, and therefore must be all right lines.

VOL. II. N° 176.

HOUR-LINE, a divided line on the edge of Collins's quadrant, being only of tangents of forty-five degrees each, let together in the middle. Its use, together with the lines of latitude, is to draw the hour-line of dials that have centres, by means of an equilateral triangle, drawn on the dial-plate. See DIALLING-LINE, and SCALL.

HOURS, in *Ancient History*, is a name given by the MACHONIANS to those females that are designed for the faithful in paradise. There are not the same with whom they have lived on earth, but formed for this purpose, with singular beauty and endearing charms.

HOURSAGE, a fee which a carrier, or other person, pays for laying up goods in a house.

HOUSE, habitatio, a place built with conveniences to live in, or a building wherein to shelter a man's person and goods from the inclemencies of the weather, and the injuries of dissipated perfumes.

We say a brick house, a stone house, a house of two stories, or three stories, a manor house, a farm house, &c. Ancient Rome consisted of forty-eight thousand houses, all insulated or detached from one another.

For the number of houses, and of inhabitants to a house in England, see the article ENCREVATION of life. A pleasure house, or country house, is that built for a person to enjoy and divert himself occasionally in. This is the villa of the ancient Romans; and what in Spain and Portugal they call *quintas*; in Provence, *casiers*; in some other parts of France, *châteaux*, in Italy, *villa*.

The word *vigne* is itself sometimes used in English to denote the country-seats of the noble Romans; as the *vigna Perusse*, *vigna Bergasse*, &c.

The citizens of Paris have also their *maisons de plaisance*, *hôtels-hôtels*, to retire to, and entertain their friends; which in Latin might be called *villa*; the emperor Domitian having a house built for the like purpose, intended under this name by Martial, lib. ii. *ep.* 59.

It is a thing principally to be aimed at, in the situation of a country house, or seat, that it have wood and water near it. If it cannot conveniently be built among trees, yet there are few places where trees may not be speedily raised about it.

It is far better to have a house defended by trees than hills; for trees yield a cooling, refreshing, sweet, and healthy air and shade, during the heat of the summer, and very much break the cold winds and tempests, from every point in the winter. The hills, according as they are situated, defend only from some certain winds; and if they are on the north side of the house, they defend from the cold air in the winter, so they also deprive you of the cold refreshing breezes, which are commonly blown from thence in the summer. And if the hills are situate on the south side, they then prove also very inconvenient.

A house should not be too low seated, since this precludes the convenience of cellars. If you cannot avoid building on low grounds, set the first floor above the ground the higher, to supply what you want to sink in your cellar in the ground; for in such low and moist grounds, it conduces much to the driness and healthiness of the air to have cellars under the house, so that the floors be good and celled underneath. Houses built too high, in places obvious to the winds, and not well defended by hills or trees, require more materials to build them, and more also of reparations to maintain them; and they are not so commodious to the inhabitants as the lower-built houses, which may be built at a much easier rate, and also as complete and beautiful as the other.

In buildings, or houses not above two stories with the ground-room, and not exceeding twenty feet to the rafters, and upon a good foundation, the length of two bricks, or eighteen inches for the leading course, will be sufficient for the ground-work of any common structure, and six or seven courses above the earth to a water-table, where the thickness of the walls is shated, or taken in, on either side the thickness of a brick, namely, two inches and a quarter.

For large and high houses, or buildings, of three, four, or five stories with the garrets, the walls of such edifices ought to be from the foundation to the first water-table three leading courses of brick, or twenty-eight inches at least; and at every story a water-table, or taking in on the inside for the summers, girders, and joints, to rest upon, laid into the middle, or one quarter of the wall at least, for the better bond. But as for the innermost or partition-wall, a half brick will be sufficiently thick; and for the upper floors, nine inches, or a brick length, will suffice.

The parts, proportions, &c. of the houses in London, are regulated by Statute. See BUILDING, and article FIRE-SACKS.

Every man has a right to air and light in his own house; and therefore if any thing of an infectious smell be had near the house of another, or his lights be stopped up, dark.

darkened by buildings, &c. they are nuisances punishable by our laws; but no action lies for merely obscuring the opening of a prospect. If a man's house be attacked with intent to kill, and the owner or his servants kill the thieves in defending him and his house, this is not felony, and incurs no forfeiture. One man may compel another to repair his house in several cases, by the writ *de domo reparanda*. The doors of a house may not be broken open on arrest, except in cases of treason or felony, &c. The riotously pulling down of a house is felony, excluded clergy. Stealing lead, or iron bars, or rails fixed to houses, &c. is felony punishable by transportation, by 4 Geo. cap. 32. The husband is liable to damages by the burning of houses. 9 Geo. cap. 32. See *ARSON*, *HABITATION*, &c.

HOUSE, let. See *HOT* and *STOVE*.

HOUSE, price. See *GREEN*.

HOUSE, to. See *ICE*.

HOUSE, tower, a little edifice erected at the corner of a garden, and covered so as to let air in on all sides; or to exclude it, as you find proper.

HOUSE, town, or hall, is a place where the officers and magistrates of a town or city hold their meetings, for the due administration of their laws and policy. See *HALL* and *COURT*.

HOUSE, work. See *WORK-HOUSE* and *HAIR-WEAVE*. See also the article *HAIR-WEAVE*.

HOUSE of correction. Justices of the peace in their quarter-sessions are to make orders for erecting houses of correction, and for the maintenance and government of the same, and for the punishment of offenders committed thither. 30 Eliz. cap. 4. 17 Geo. II. cap. 5. In every county of England there shall be a house of correction, built at the charge of the county, with all conveniences for the setting of people to work, or every justice shall direct so. And the justices in sessions are to appoint governors or masters of such houses of correction, and their salaries, &c. which are to be paid quarterly out of the county stock. These governors are to let the persons sent on work, and moderately to correct them, by whipping, &c. and to yield a true account every quarter-sessions of persons committed to their custody; and if they suffer any to escape, the justices may fine them. 7 Jac. I. cap. 4. 12 Geo. II. cap. 29.

The house of correction is for the punishing of idle and disorderly persons, parents of bastard children, beggars, servants running away, trespassers, rogues, vagabonds, &c. Poor persons refusing to work, are there to be whipped, and set to work and labour; and any person who lives extravagantly, having no visible way to support himself, may be sent to the house of correction, and set to work there, and may be kept there, until he gives the justice satisfaction in respect to his living, but not to be whipped. A person ought to be convicted of vagrancy, &c. before he is ordered to be whipped.

BARTHELEMY is a prison for correction in London, and offenders may be sent thither.

HOUSE is also used for a convent or monastery.

Regular priests give the name *houses* to the places they reside in, and not that of convents or monasteries, which properly belong to simple friars. Thus we say, the *Joanite house*, and the *Barnabites or Thaumatis house*.

The Jesuits have both professed houses, and colleges for novices, which they call *houses of probation*.

They have also *houses of retreat* for spiritual exercises, where they receive secular persons and ecclesiastics, disposed to practise the same with them for eight or ten days.

HOUSE is also used for one of the estates of the kingdom assembled in parliament.

Thus we say, the *house of lords*, the *house of commons*, &c. See *COMMONS*, *PARLIAMENT*, and *PEERS*.

HOUSE is also used for a noble family; or a race of illustrious persons issued from the same stock. See *GENEALOGY*.

In this sense we say, the *house of family* of the Stuarts, the *house of Bourbon*, the *house of Hanover*, of Austria, of Lorraine, of Savoy, &c.

HOUSE, in Astrology, a *DOECATAMORY*, or twelfth part of the heavens.

The division of the heavens into *houses* is founded on this, that the stars and planets, when found herein, are supposed to have certain influences, either good or evil, upon sublunary bodies; and to each house is assigned its particular virtue or influence; upon the consideration whereof they draw *NOGOCOSMOS*.

This division is made by its great circles, called *circles of position*, which cut each other in the common intersection of the meridian and horizon, in the ordinary way of domifying, which is that of Regiomontanus; for the ancients add three other ways.

These circles divide the equator into twelve equal parts, of thirty degrees each, without any regard to the zodiac.

The horizon and meridian are two circles of the celestial sphere, which divide the heavens into four equal parts; each whereof comprehends three houses. There are six above the horizon, and as many below it; and six eastern and six western houses.

The scheme or figure of the heavens consists of twelve triangles, which are likewise called *houses*; wherein are laid down the stars, signs, and planets, comprised within the respective spaces of the circles of position.

Each planet has two certain houses, wherein they say it exerts itself with peculiar vigour. Leo is the sun's house, and Cancer that of the moon; Capricorn is Saturn's, &c.

Some call the *houses*, *dedecimones*; but that name is more immediately appropriated to the twelve signs or divisions of the zodiac. See *DOECATAMORY*.

The astrological houses have their particular names according to their qualities. The first is the *house of life*; being the ascendant, and containing five degrees above the horizon, the rest beneath it; the second is the *house of riches*; the third, the *house of husbandry*; the fourth, in the lowest part of heaven, the *house of relations*, and the angle of the earth; the fifth, the *house of children*; the sixth, the *house of health*; the seventh, the *house of marriage*, and the angle of the west; the eighth, the *house of death*, and upper part; the ninth, the *house of glory*; the tenth, the *house of honour*; the eleventh, the *house of friends*; and the twelfth, the *house of enemies*.

It is popularly, and as it were poetically, said, that the sun has twelve houses, by which are meant the twelve signs, though in reality, it has only one sign, viz. Leo; besides, the division of *houses* is accommodated to the equator, and not the ecliptic.

They begin numbering the houses with the ascendant, and pain them to the medium caeli; so that the vernal point makes the beginning of the tenth.

HOUSE, difference of, in Heresy. See *DIFFERENCES*. **HOUSE-SIDE, Effeminate, in Law,** or an allowance of timber out of the lord's wood, for the repair and upholding a house, or tenement.

Some make *house-side* two-fold, viz. *Effeminate* and *Estimand* & *Arrend*. See *REVENUE*.

HOUSE-BREAKING, or HOUSE-ROBBERY, the robbing or plundering a man in some part of his house, or his booth or stall, in a fair or market; the owner, or his wife, children, or servants, being within the same.

This was made felony by stat. 25 Hen. VIII. and 3 Ed. VI. but it is since also made felony, though count be within the house, 26 Eliz. See *BURGLARY*, and *LARCENY*.

HOUSE-BURNING. See *ARSON*.

HOUSE-QUARTER. See *PAINTER*.

HOUSE-TOO. See *WINDMILL*.

HOUSE-TOO-SLICK, is a middle sort of linen cloth between fine and coarse. See *TOILETTE*.

HOUSED is, in Ship-Building, the steamer part of a ship, which, since the breadth of her keelson is brought in too narrow to her upper-work, that she is *house-in*, or pinched in too much.

HOUSED is also applied to the situation of the great guns of a ship, when they are secured at sea by their tackles and breechings.

HOUSEE, in the Menager. See *HOUSING*.

HOUSELEEK, Sempervivum, in Botany, a genus of the *dicentra* or *dedecimones* class. Its characters are these: the flower has a concave empalement, cut into many acute segments; it has ten oblong, spoon-shaped, pointed petals, and twelve or more narrow awl-shaped stamens, terminated by roundish summits; it has twelve geminae placed circularly, sitting upon so many styles, which spread out, and are crowned by acute filaments; the gemina afterward become so many thorns, rounded capsules, pointed on the outside, and open on the inside, filled with small seeds. There are seven species.

The common large *houseleek* is seen in every part of England, growing on the tops of houses and walls, and is easily planted by cuttings, which they put out in plenty. If these are planted in mud or strong earth, on a building or old wall, they will thrive without further care.

Houseleek is cooling and refrigerant; and though not often given inwardly, is recommended by some as good to quench thirst in fevers, mixed with pulsatilla, and also for heat and sharpness of urine. Pervosius, the physician Pasperum, commands an equal quantity of it, with three ounces of the juice of this, and Persea, macerated, boiled to the consumption of a third, and then given in drink as a certain medicine to stop a bloody and bloody flux. Outwardly it is useful against ulcers and scalds, St. Anthony's fire, and the thonging.

HOUSELEEK, lesser. See *SEDUM*.

HOUSELEEK, small annual. See *TITILEA*.

H O W H U E

HOBALEK, water, of Egypt. See PIATIA.

HOUSEHOLD, the family or domestics of a prince, or private person.

The civil government of the king's court belongs chiefly to the lord-steward of the *household*, who has an annual salary of 1200*l.* He has authority over all officers and servants of the king's house, except those of the chapel, chamber, and stable, who are under the jurisdiction of the lord-chamberlain, master of the horse, and dean of the chapel.

Under the lord-beward are a treasurer of the *beesfield*, whose place is 1200*l.* a year; comptroller, with the same salary; collector, with 500*l.* a year; deputy collector; master of the *beesfield*; clerks of the green cloth, clerks, comptrollers, &c.

The troops of the household are the *hofs-guards*, *hofs-grenadiers*, and *hofs-guards*. The household troops of France are called the *gendarmerie*.

HOUSEHOLD days are four solemn festivals in the year, when the king, after divine service, offers a **GRANT** of gold to God on the altar.

The *holydays* are Christmas, Easter, Whit Sunday, and All Saints.

The *banfield* days are a part of the twelve collar and offering days.

HOUSING, or HOUSE, a cover laid over the saddle of a horse, in order to save it from the weather, dirt, &c. The word is formed of the French *hous*, which signifies the same thing, though it anciently denoted a kind of *house*, worn by country people.

The cavaliers appeared with their embroidered *hofsings*.

ROVERNO, *loin*, is a piece of Russ fastened to the hinder part of the saddle, that covers a horse's croupe; either for the sake of ornament, to hide the horse's leanings, or to save the cheeks of the rider from being dashed and soiled by the sweat of the horse.

Housivo, *for*, is a piece of cloth bordered with a fringe, oftentimes put round the saddle, to cover the croupe, and hang down to the lower part of the belly, to save the stockings of those who ride without boots.

HOUNKO, among *Bricklayers*, a term used for a brick which is warped, or is call crooked or hollow in burning, in such a case, they say it is *maufé*.

HORRING, or HORSE-LINE, in Sea-Language, denotes a small line formed of three fine strands or twills of hemp, smaller than rope-yarn. It is chiefly used to seize blocks into their drops, to bind the corners of the sails, or to fasten the bottom of a sail to its foot-reef. See

HOUSTONIA, in the Linnean system, *Houstonia*, the name of a plant called *parviflora* after Morison, and found here. It is a member of the genus of plants of the tribe *menyanthes* class the dicotyledons of which are, that the cells in an extremely small cross section, divided into four segments, and remaining after the division is fallen, the four sides of one angle, the shape of a funnel, with a long cylindric tube, and an open mouth divided into four segments, which are rounded at their ends; the laminae are four extremely small filaments, fused in the neck of the flowers; the anthers are simple; the germ of the pistillum is roundish and bare; the style is single, and shorter than the laminae and the stigma bifid and acute; the fruit is a roundish double capsule, containing two cells, with two valves; the seeds are single, and the valves placed opposite to the partition of the cells. There are two

HOWITZES, in *Artillery*, are a kind of mortars, of German invention, which are mounted upon carriages like travelling gun-carriages, and have their trunnions directly in the middle. The construction of them is very different from that of mortars, excepting the chamber, which are all cylindrical. They are fired either by the diameter of the bore i. e. a 4-inch *bore* is that the diameter of which is 4 inches. *Howitzers* are capable of doing great execution, by firing shells and grapes of shot, in a single hour the distance is finally, not in the field, if they were placed in the flanks, or between the battalions. They are also more easily carried from one place to another than mortars. For the dimensions of different *howitzers*, and remarks on their contrivance, the reader may consult Muller's *Treatise of Artillery*, part iii. c. 185, &c. See *Zak II. General*, p. 16, in which A. E. represents the first reinforcement, E. the second, F. G. the 3^d, G. H. the muzzle, I. the barrel, K. K. the trunnions. The other parts are the same as those of the cannon and mortars.

POWDER, or M-OXEN, a vessel much used by the Dutch; built something like a pink, but rigged and masted like a barge.

Howlers carry from fifty to two hundred ton; and with a small number of hands will go to the East Indies. They are commonly navigated with two masts, viz. a main-

mast and a mizen-mast. They tack food and short, will
fall well, and lie near the wind, and live almost in any
(62-

HOWLE, in *Ship-Building*. When the foot-boards of a ship are scarfed into the ground-timbers, and bolted, and then the plank laid on them up to the celop, the carpenters say, they begin to make the ship *sound*.

HOY, a small vessel or bark, usually rigged like a sloop, and employed for carrying passengers and luggage from one place to another, particularly on the sea-coast. In Holland the *hoy* has two masts; in England it has but one, when the main-mast is sometimes extended by a boom, and sometimes without it.

HOYACHU, in *Italy*, the name given by the Chinese to the *ARACHIS*. They make great use of this tree in arts and medicine. They have a way of striking a fine yellow upon paper with its flowers; and they give the food in several diseases, in some of which, as in the dysentery and hemorrhages, they are of great service. But, beside these, they make an odd medicine of them, which they take with great readiness for purposes it can never answer. They pick out the seeds externally from the pods, as soon as ripe; they put these into a fat rillet, and cover them with oil's pulp; this is to be left for a hundred days to dry, in a place where the sun does not come; after this, one of these seeds is to be swallowed every day before the first meal; and, by continuing this a proper time, they say the eye-light, if lolly, is restored, and their green hairs become black. Others, for the Colic, take of Olive, 2v 346v.

HOZING *of dogs*, the cutting out the balls of their feet.
See EXEMPTATION.

FLUORI, in *Natural History* the name of a bird very often mentioned by the Arabian authors. It is defined to be a bird somewhat larger than a goose, having very short wings in proportion to its bulk, so that it cannot fly well, and therefore, according to great part to the Syrian hunters. It is said to be common about Damascus. By this place of its frequenting, and by the description, it appears to be the *ANUSARI*; that bird being very plentifully found about Damascus, and being hunted with swift dogs on the foot plain thereabout.

HUCK, in *descriptive*, a name used by some authors for the German river-trout. It much resembles the common river-trout in shape, but is covered all over the back with innumerable black spots; the scales are red, and have also some black spots, though they are not very numerous, on them; the under-skin has also some black spots, but there are none on any other part of the head; the fins are red, and it differs from the common trout in having no teeth on the middle of its palate; it also grows to a much larger size than our trout, and has none of the red spots which are so plentiful on that fish.

HUCKABACK, in Commerce, is a kind of linen, on which the letters are raised.

HUCKLE-BONE, the hip-bone. See COX = *offa*.
HUCKITER, one that sells provisions or small wares by retail.

HUDSON'S BAY Company. See COMPANY.

HUDSONIA, in *Blechn.* a genus of the *Andropogonia* minor.

its class. Its characters are, that it has no corolla, a five-leaved tubulous calyx, fifteen stamens, and a single-celled three-valved capsule, containing three seeds.

HUE-AND-CRY, derived from the French *huer* and *crier*, which both signify to *flout*, or *cry aloud*, denotes the pursuit of one who has committed felony, &c. on the highway.

If a party robbed, or any in the company of one murdered or robbed, come to the constable of the next town, and require him to raise *ho-mens-ry*, or to pursue the offender, describing him, and fleeing, as near as he can, which way he is gone, the constable is forthwith to call for aid from the parish to tack the felons, and if he is not found there, he is to give the next constable warning, till he be apprehended, or at least pursued to the *ten-feld*.

The Normans had a pursuit with a cry after offenders, not unlike this; which they called *chasse de bœuf*. See CLAUDE.

Hue is also used alone, ann. 1. Edw. I. stat. 2. In ancient records it is called *butrsum* & *clameur*, which properly signify a pursuit by horn and by voice.

This process of purfuing is mentioned by Statute Westm. 1. 3. Edw. 1. cap. 9. & 1. Edw. 1. *de officio coronatorum*. But the principal Statute relative to this matter is that of Winchester, 13. Edw. 1. cap. 1. & 4. which directs that from thenceforth every county shall be so well kept, that immediately upon robberies and felonies committed, fresh suit shall be made from town to town, and from county to county; and that *hue and cry* shall be raised upon the felons, and they who keep the town shall follow

with *hus-and-ery*, with all the town and towns near; and so *hus-and-ery* shall be made from town to town, until they be taken and delivered to the sheriff. And that such *hus-and-ery* may more effectually be made, the hundred is bound by the same statute, cap. 7. to answer for all robberies therein committed, unless they take the felon, which is the foundation of an action against the hundred, in case of any loss by robbery. By stat. 27 Eliz. cap. 12. no *hus-and-ery* is sufficient, unless made with both horsemen and footmen. And by stat. 8 Geo. II. cap. 16. the constable or like officer refusing or neglecting to make *hus-and-ery*, forfeits 5*l.* and the whole vill or district is full in itself liable to be amerced, according to the law of Alfred, if any felony be committed therein, and the felon escape. *Hus-and-ery* may be raised either by precept of a justice of the peace, or by a peace-officer, or by any private man that knows of a felony. But if a man maliciously or wantonly raises a *hus-and-ery*, without cause, he shall be severely punished as a disturber of the public peace. Blackst. Comm. vol. II. p. 290, &c. See HIGHERWAYMEN.

In supplement to this ancient establishment, Sir John Fielding's plan was instituted for the discovery of offenders, after they have escaped the first pursuit upon *hus-and-ery*, by sending immediate notice to a certain known office in London, from whence are issued weekly accounts to every part of the kingdom, describing the offence and the offender with as much accuracy as the case will admit. By these means many notorious offenders have been apprehended, and much stolen property hath been recovered.

HULLS. See BALKERS and PILLARD FISHERY.

HUG, or *Cord/HUG*, a term used in wrestling, when one has an advantage on his breast, and holds him fast there.

HUCONIA, in *Bigney*, the name of a genus of plants of the *monadelphia* decandria class, the characters of which are these: the perianthium is small, narrow, acute, and divided into five segments; the flower is composed of five large, round, and expanded petals; the stamina are ten tubulose filaments, shorter than the flower; the anthers are simple; the germens of the pistil is roundish; the styles are five in number, and are very slender; the stigma are capitate; the fruit is a globose berry, affixed upon the cup; the seed is single, striated, and hard.

HUGUENOTS, an appellation given by way of contempt to the reformed or protestant Calvinists of France. The name had its first rise in 1560; but authors are not agreed as to the origin and occasion thereof: but one of the two following seems to be the least forced derivation.

One of the gates of the city of Tours is called the gate *Faugon*, by corruption from *frs Hugon*, i. e. the late *Hugon*. This Hugon was once count of Tours, according to Eginhardus, in his Life of Charles the Great, and to some other historians. He was a very wicked man, who by his fierce and cruel temper made himself dreadful; so that after his death he was supposed to walk about in the night time, beating all those he met with: this tradition the judicious Thuanus has not scrupled to mention in his history. Davila and other historians pretend, that the nickname of *Hugonots* was first given to the French protestants, because they used to meet in the night time in subterraneous vaults near this gate of Hugon; and what seems to countenance this opinion is, that they were first called by the name of *Hugonots* at this city of Tours.

Others assign a more illustrious origin to that name; and say that the leaguers gave it to the reformed, because they were for keeping the crown upon the head of the present line descended from Hugh Capet; whereas they were for giving it to the house of Guise, as descended from Charles the Great.

Others again derive it from a French and faulty pronunciation of the German word *eidgenossen*, signifying confederates, and originally applied to that valiant part of the city of Geneva, which entered into an alliance with the Swiss cantons, in order to maintain their liberties against the tyrannical attempts of Charles III. duke of Savoy. Their confederates were called *Eggnits*, whence *Hugonots*.

The persecution which they underwent has scarce its parallel in the history of religion; though they obtained a peace from Henry III. in 1576, it was only of short continuance; and their sufferings, mitigated by the famous edict of NANTES, granted to them in 1598 by Henry IV. were again renewed, after the revocation of this edict, by Lewis XIV. in 1685.

HUESIER, a French name for an usher, squire, or herald.

HUTINGO *pollichin*, in *Ichthyology*, the fish we commonly call in English the whiting-pollack. It is a fish

very like the common whiting in shape, but much larger, and is something broader, and less thick. It is common in the northern seas, and is a good fish for the table. Its food is other smaller fish, and particularly the ammodytes or sand-eels, numbers of which are usually found in its stomach. It is distinguished from the cod by its head, being smaller, and its body broader and thinner; by its having no beard; and its lower pair of fins is much smaller than in that fish.

HUJUS, or *Horreum Dret*, in *Archæology*, a surname given by the Romans to *Fortuna*, viz. she had a temple at Rome, erected by Q. Catulus.

HULKS are large vessels, having their gun-decks from a hundred and thirteen to a hundred and fifty feet long, and from thirty-one to forty feet broad, and fitted with an apparatus, in order to hoist or take out the masts of his majesty's ships, as occasion requires. They will carry from four hundred to a thousand tons.

Antiently, the word *hulk* seems to have signified a small vessel.

HULK is also a name bestowed on any old vessel laid by, as unfit for further service. It is probably derived from the *carina*, or vessels of lumber of the ancient Grecians.

HULL of a ship is her main body, without any masts, yards, sails, or rigging. See *Ship*, fig. t. lit. A to B.

To **HULL**, or *to hull* a ship, is understood of a ship, when, either in a dead calm, or in a storm, the cannot carry all her sails, but they are taken in to preserve them; so that nothing but her masts, yards, and rigging, are above, and her helm tied down to the lee-side of the ship. In this state she will lie easily under the sea, if she be a good sailer, and make her way one point before the beam.

To *strike* a **HULL**, is to be closely or obscurely in the sea in a storm, or to tarry for some comfort, bearing no sail, with the helm lashed a-lee.

To **HULL** a ship, is to fire cannon-balls into her hull, with in the point-black range.

HULLOCK of a sail, at sea, is when, in a great storm, some small part of a sail is cut and left loose. It is chiefly used in the mizen-hall, to keep the ship's head to the sea; then all the rest of the sail is made up, except a little at the mizen-yard-arm. Also, when a ship will not weather a gale, to lay her head the other way, they loose a *hullack* of her fore-sails; and then changing the helm to the weather side, she is made to fall off, and to lay her head where her stern lay.

HUMAN, something that relates to man, or the NATURE of man.

The human body is the subject of medicine. See *Human Body*.

Epicurus and his followers deny that the gods concern themselves with human affairs. See *EPICUREANISM*.

Faith is distinguished into divine and human. See *FAITH*.

HUMANITY, the nature of MAN, or that which denominates him human.

Nestorius would not allow the infirmities of *humanity* to be attributed to the Deity; nor the attributes of the Deity to *humanity*. See *NESTORIANISM*.

HUMANITIES is used, plurally, for the *humanities literæ*, i. e. the study of the Greek and Latin tongues, grammar, rhetoric, poetry, and the ancient poets, orators, and historians.

HUMATION, *Humatio*. The most ancient way of disposing of the dead was by *humation*, or interment. See *BURIAL*.

HUMBLE-EE, in the *History of Insects*. See *BOMBYLUS*.

HUMBLE-BEE, *ballard*. See *FAUX ballard*.

HUMBLE-BEE flies, in *Natural History*, the name of a class of flies of different sizes, but all agreeing in the great resemblance they bear to the *humble-bees*, of the smaller or middle-sized species. These might, at first sight, very naturally pass for real *humble-bees*; but a closer examination will shew them not to be such, as they have not the trunk of the *humble-bee*, and have only two wings. The species of the *humble-bee* fly are many of them of absolutely different genera one from another, some of them having trunks, and others having a distinguishable mouth. See *CELEST*.

If the figure of these flies, in their winged state, attracts our curiosity and attention, their prior state, that of the fly-worm, of most of them ought surely much more to do so. The place nature has assigned the works of these flies for their habitation, is indeed a most strange one; there is no other place for them to live in under the form, to begin their destined growth, and be fitted for their transformations, but in the intestines of horses, asses, and the thick and firm skin of oxen. In the latter case, the worm hatched from the egg of its parent fly, deposited there, makes the tumor in the places which alone furnishes it with food and habitation, and in the middle of which it has a place to breathe. See *HORSE-LUNG*. It is not an invariable law of nature, however, that all

the worms of the *humilis* flies are to feed on animal substances; for we find some delighted with vegetable food, and particularly one which loves none but the bulbous roots of flowers. Reaumur's Hist. Nat. vol. iv. p. 497, &c.

HUMBLE plant. See SENSITIVE plant.

HUMECTATION, formed of *humor*, moisture, moistening, in Pharmacy, the preparing of a medicine, by steeping it a while in water, in order to soften and moisten it when too dry; or to cleanse it, or prevent its subtle parts from being dissipated in grinding, or the like.

HUMECTATION is also used for the application of moistening remedies.

In this sense we say, embrocations, emplaisters, unguents, humectations, fomentations, &c.

HUMERUS, or *Os HUMERI*, in Anatomy, the uppermost bone of the arm, popularly called the *shoulder-bone*; extending from the scapula, or shoulder-blade, to the upper end of the cubitus, or elbow. See *Tab. Anat. (Ulnae)*, fig. 3. n. 6, fig. 7. n. 8, fig. 7.

The *humerus* is a large, round, fibular bone, of a pretty hard compact substance; its inward cavity contains the marrow, is considerably long and large.

At its upper end it has a large round head, which is covered with a very smooth cartilage, and is received into the cavity of the scapula, which makes a juncture per arthrodium. This head of the bone being much larger than the socket into which it is received, the part extant is strictly embraced by a ligament, one edge of which is fastened to the margin of the cartilaginous socket of the scapula, and the other to the lower part of the head of this bone, hereby uniting them firmly together; yet so as to leave the motion free of all the articulations of the body, and therefore the bone very liable to dislocations.

At the lower end of the *humerus* are two processes, covered each with a cartilage; the external and lesser receiving the extremity of the radius, and the internal the head of the cubitus.

On the outside of each of these processes is a small eminence, to which are fastened the ligaments and heads of the muscles that move the carpus and fingers.

In this bone are also three sinuses; one on the fore-side of the large process, receiving a process of the cubitus; another on the back-part, which receives the olecranon; and the third, a small femoral one between the two processes, answering to the eminence of the sinus of the cubitus.

The later anatomists allow this bone five different motions, viz. upwards, downwards, forwards, backwards, and rotatory; and five pairs of muscles for the performance of the same, viz. the deltoides, teres, pectoralis, infraspinatus, subscapularis, &c. which see.

Os HUMERI, cartilages of the. The cartilage by which the hemisphere at the head of the *os humeri* is covered, is gradually thicker towards the middle, and thinner towards the edges. The four surfaces of the tuberosities, which appear cartilaginous in dry bones, serve only for the insertion of the tendons of four muscles, which move the *os humeri* on the scapula. The channel or sinus between the two tuberosities is partly covered by a thin crust, which appears rather ligamentary than cartilaginous, and partly by a tendinous stratum. The trochlea and small head of the lower extremity of the *os humeri*, are covered with a common cartilage, in which the same proportion of thickness is observable, as in that of the upper extremities; and this holds indeed pretty generally of the convex articular cartilages; and the fossulae near the pulley and the small head, are covered with a thin cartilaginous and ligamentary varnish.

Os HUMERI, ligaments of the. The capsular, or mucilaginous ligament, loosely surrounds the whole articulation of the scapula with the head of the *os humeri*. The true ligament of this joint seems to be made up of two sorts of ligaments closely united together, viz. of a capsular ligament, which surrounds the whole articulation, and of several true ligaments which run over, and closely adhere to the forer at different distances. On the body of the *os humeri* there are two particular ligaments, which may be termed the intermuscular, or lateral ones; they are long, flat, thin, but strong and narrow, fixed by one edge along the two lower thirds of the bone, and reaching to both condyles; they are broad, pretty tight, and are very narrow at the upper part, but broader towards the condyles.

The lower extremity of the *os humeri* is joined to the bones of the fore arm, by two fasciculi of ligamentary fibres, one fixed to the internal condyle, the other to the external. Each fasciculus is composed of fibres closely joined together near the condyle, but afterwards passing in distinct bands like a goose's foot. The capsular ligament is fixed to the condyles, and then covers them, and

is afterwards fixed round both sides of this lower extremity above the fossulae. The fossulae are slightly varnished over, also with a cartilaginous substance. This capsula seems to be strengthened by a ligamentary web, the fibres whereof cross one another, in different directions, and appears larger and looser when the muscles are separated from it, than when closely united to them in its natural state. Winslow's Anatomy, p. 139.

HUMERUS, luxated. The *humerus*, from the length and laxity of its ligaments, the largeness of its motion, and the shallowness of its cavity in the scapula, into which it is articulated, is rendered, of all the bones, the most subject and easy to be luxated. The head of this bone may often be dislocated, under the arm-pit; sometimes forward, sometimes backward, and even below the scapula, but seldom perpendicularly downwards, and never directly upwards, unless the acromion and coracoid processes of the scapula should chance to be fractured at the same time; besides, as long as the strong deltoid and bicipital muscle of the *humerus* remain entire, they greatly resist and keep down the *humerus* from being luxated upwards.

A dislocation of the *humerus* may be known by a depression or cavity on the top of the shoulder, and an inability to move the arm. When the dislocation is downward or forward, the arm is elongated, and a ball or lump is perceived under the arm-pit; but when it is backward, there appears a protuberance behind the shoulder, and the arm is thrown forward toward the breast.

As soon as a luxation is discovered in the *humerus*, the safest way to attempt the reduction of it, is to place the patient on the floor, or on a low stool; two strong assistants are then to be placed on each side of him, one to keep firmly hold of his body, that it may not give way to the extension, while the other lays hold of the luxated arm with both his hands, a little above the cubitus, gradually and strongly extending it. But before that extension be made, the surgeon himself should have a large and strong napkin, of a sufficient length, tied at the ends, and hung about his neck, so that the knot may hang behind, but the other part of the napkin over his breast. The patient's arm must then be put through this napkin up to the shoulder, and the surgeon must lay hold of the head of the *humerus* with both his hands; this done, the assistant, who has hold of the arm, is to extend it sufficiently, and the surgeon is to elevate the head of the *humerus*, by means of the napkin through which the arm is put, directing it with his hands, till it slips into its former cavity in the scapula.

This seems the most safe, ready, and commodious of all methods, for reducing luxations of the *humerus*; but it is to be acknowledged, that the extension cannot, by this means, be made sufficiently strong, in some cases, particularly when the patient is very robust, or when the case has been delayed a considerable time without assistance. When one or two assistants therefore are not sufficient to make a proper extension, it is easy to employ more, by means of a machine tied about the limb, and a proper number of assistants to hold the patient's body steady against that force. And when all this is not sufficient, the surgeon is forced to have recourse to machines with ropes and pulleys; which, though the patient is usually terrified a little at them, yet make an easier and a more equal and regular extension than can be done by the hands of ever so many assistants. Heister, book incip. 7. See *ANKE*.

Mr. Ficke has contrived a portable instrument for this purpose, which consists of two boxes A, A, joined together by the hinge, F, in the middle, in which, when folded together, is contained all the apparatus necessary for reducing a dislocated shoulder. See *Tab. III. Surgery*, fig. 22.

The length of this instrument, when that up, is one foot eight inches, its breadth nine inches, and its thickness three inches and a quarter. When it is opened, it is kept so by two hooks fixed on the back-side of it; and, when one end of it stands on the ground, the other stands high enough to become a fulcrum, or support of the lever B D, which is fixed on a roller E, by a large wood-screw, which turning sideways, as well as with the roller, it obtains a circumrotatory motion, so that it will serve to reduce a luxation, either backward, forward, or downward. The roller on which the lever is fixed, is just the diameter of the depth of one of the boxes, into which are driven two iron pins, the ends of which are received by the two sides of the box, which are an inch thick. The lever is two feet four inches long, and is cut off and joined again by two hinges C, to fold up so as to be contained in the boxes. On the backside of it is a book, to keep it straight. One other end of it is to hang over the roller about an inch and a half, which is

to be excavated and covered with buff leather, for the more easy reception of the head of the *hammer*. Two iron checks, D, are screwed on each side of the lever, to receive through them an iron roller, which has two holes through it, to receive two cords coming from a brace E, fixed on the lower head of the *hammer*; so if it be applied on the muscular part of the arm, it never fails slipping down to the joint, before you can extend the limb. The iron roller has a square end, on which is fixed a wheel G, within the check notched round, which works as a ratchet, on a spring-ketch underneath the lever, by which it is stopped, as you wind it with a winch; and may at pleasure be let loose, as there shall be occasion for it, by discharging the ketch. The brace E, compared with common bandages, is of more consequence than can easily be imagined by unexperienced persons. It consists of a large piece of buff leather, big enough to embrace the arm, sewed on two pieces of strong iron curved plates, rivetted together, one of them having an eye at each end, to fasten two cords in; the other is bent at the ends into two hooks, which are to receive the cords, after they have encircled over the arm above.

In order to keep the patient steady in his chair from coming forward, or letting the scapula rise up on depressing the lever, after the limb is extended by the winch, three small be fixed over the shoulder a girth, H, H, with two hooks at the end of it, long enough to reach to the ground on the other side, where it must be hooked into a ring I, screwed into the floor for that purpose.

We ought not to omit observing here, that there are several other contrivances invented both by ancient and modern surgeons for reducing a luxation of the *hamerus*, some of which the reader will find described in Heister's Surgery, part i. book iii. cap. 7.

After all, Mr. Heister observes, that the surgeon's hands and a napkin, with strong and dextrous assistants to make the extension, and hold the patient firm, will, of themselves, be generally sufficient for this purpose.

Mr. White, surgeon of the Manchester infirmary, gives an account of a new method of reducing the shoulder, without the use of an ambe, which he has tried with success in cases where the common methods have failed. For this purpose, having screwed an iron ring into a beam at the top of the room, he fixed one end of his pulleys to it, and fastened the other to the dislocated arm by ligatures about the wrist, placing the arm in an erect position. In this manner he drew up his patient, till his whole body was suspended, whilst two persons supported his arm above the elbow. He then attempted to conduct the bone into its place with his hands; when feeling it to give way, and hearing it snap, he concluded it must have returned into its socket, and ordered him to be taken down as carefully as possible. The bone having somewhat changed its situation, he tried the heel in the socket, and the bone returned to its place with the greatest facility. Lond. Med. Off. c. vol. ii. p. 273, &c.

CY HUMERI FRACURA. Fractures of the *hamerus* are the least dangerous when near its middle, and much worse when near its upper or lower head. It sometimes happens, that the fractured ends of this bone keep their places, but much more frequently they are found slipped over one another; by which means the fractured limb is made shorter than the sound one: sometimes also, though much more rarely, it happens, that the divided ends of the bone recede from one another, on account of the weight of the arm, and by that means the fractured limb becomes longer than the sound one. In fractures of this bone, where the ends of the divided bone have slipped over one another, as is usually the case, there are required both force and skill to reduce them, especially if the patient has such nerves and large muscles, as is usually the case with strong men. To extend the arm on this occasion, the patient must be seated on a high stool, and his assistant must hold of his arm firmly above the fracture, keeping his elbow gently bent; then the lower part of the arm beneath the fracture is in like manner to be taken hold of, and the arm to be gently extended forward, by endeavouring to remove each part from the other, in a right line. The surgeon is then to take hold of the fractured part of the arm, and with both his hands reduce the fractured bones into their proper places, while the arm is kept in a proper state of extension by the assistant; and when they are replaced, the limb is to be rolled up with the proper bandages. Heister's Surg. book ii. chap. 7.

HUMERI ATRIUM. In *Anatomy*, a name given by Fallopius, and others, to a muscle called by Cowper, and since by Albinus and others, *TERES minor*, and by the French *anatomique, la petite ronde*.

HUMERUS ATRIUM. In *Anatomy*, a name given by Spigelius, and others, to a muscle now generally known under the name of the *DELTOIDES*.

HUMERI PRIMA. In *Anatomy*, a name given by some ana-

tomical writers to a muscle generally known under the name of the *PECTORALIS*.

HUMETTY. In *Herology*. See *RACCOURET*.

HUMID. *HUMIDUM*, *müll.* The school philosophers make water the *primum humidum*, the first of humid bodies, and the cause or principle of humidity in others; which are more or less moist, as they partake more or less of this element.

HUMIDITY. *müll.* the quality or power of wetting or moistening other bodies. See *MOISTURE* and *HYGROMETER*.

Modern writers consider humidity as a particular species of fluidity; and define it a fluid, which, being applied on a solid body, adheres to, and communicates the quality to other bodies. Others, somewhat more accurately, call humidity the power whereby a body moistens another; but what that power is they do not know.

But of this we are certain, humidity is only a sort of relative mode. So far as the component particles of a fluid, compared with respect to the pores and particles of other bodies, or the texture thereof, are apt and disposed to enter those pores, or stick to those particles, so far is that fluid humid: on the contrary, so far as there is a repugnance or incongruity between the particles, &c. in respect of such bodies, the fluid is not humid.

Thus quicksilver is not moist in respect to our hands or cloaths, and other things, which it will not stick to; but it may be called humid, in reference to gold, tin, or lead, to whose surfaces it will presently adhere, and render them soft and moist. Even water itself, which wets almost every thing, and is the great standard of moisture and humidity, is not capable of wetting all things; for it stands or runs off in globular drops from the leaves of cabbage, and many other plants; and it will not wet the feathers of ducks, swans, and other water-fowl. Add, that the texture alone may cause the fluid to be humid; as is plain, in that neither quicksilver, lead, nor bitumens, alone will stick upon glass; yet, being mixed together, they will form a mass that will do so; as appears from such a composition being frequently used in foliating looking-glasses.

HUMIDUM RADICALE. or *radical moisture*. This in reality seems to amount to no more than the purest and most defecate part of the nutritious matter, in a condition ready to be assimilated.

By too much heat in fevers, hecticæ, &c. this humidity is too hastily exhausted and spent. See *RADICAL*.

HUMILIATI. a congregation of religious in the church of Rome, established by some Milanese gentlemen on their release from prison, where they had been confined under the emperor Conrad, or, as others say, under Frederick I. in the year 1162. This order, which acquired great wealth, and had no less than ninety monasteries, was abolished by pope Pius V. in 1570, and their houses given to the Dominicans and Cordeliers, for their luxury and credulity.

HUMILIATION. the act of humbling, i. e. of abating a person's pride, and bringing him lower in his opinion. In this sense *humiliation* stands distinguished from mortification: *humiliation* brings down the mind; mortification subdues the flesh.

HUMILIS MOTUS. In *Anatomy*, a name mentioned by Cælius, as given by some people of his time to one of the muscles of the eye, the rectus inferior of Fabricius, and deprimens of Riola; it is the depressor oculi of Albinus, being one of the quatuor recti musculi oculorum of that author.

HUMILITY. in *Ethica*, is a virtue consisting in the moderate value which a person puts upon himself, and every thing relating to him. Or, more particularly, it consists in not attributing to ourselves any excellence or good which we have not; in not esteeming any thing which we have or do; in not taking an immoderate delight in one's self; in not assuming more of the praise of a quality or action than belongs to us, and in a lowly sense and acknowledgement of our imperfections, errors, and sins. This virtue expresses itself in the modesty of our appearance, of our pursuits, and of our behaviour towards other men. It is distinguished from affection, bashfulness, and meanness.

HUMISUGA. the Ground-sucker, in *Natural History*, the name of a fly, so called, because it is supposed to live by sucking the juices of the earth, without taking any solid food. It has a brownish or dun body as some put at the insertion of the wings, and another at the end; the legs are black; the back is grey, with four red white lines running longitudinally; the wings are very, and, if put into water, they flume with a bright light like that of the glow-worm. This creature is common with us about path-ways, on mole-hills, and in other places where the ground is newly turned up. We call it the *path-fly*.

HUMMING-BIRD. *Trichia*, or *Guanambi*, in *Ornithology*, the name of a very beautiful genus of American birds, the

the distinguishing characters of which are, that its beak is of a tubulated figure, but fine as a thread; it is longer than the head, and terminated in a fine tube or pipe; the upper mandible forms a kind of sheath or case for the lower; the tongue is filiform, and rendered tubulous by the junction of two sheaths; and the feet are formed for walking. Linnaeus enumerates twenty-two species of this genus. Mr. Edwards has likewise described several different species. The least species is the smallest of all birds, but of the most beautiful and lively colours of all others: the colour of the body is a shining green; it flies very swiftly, and in flying makes a noise exactly like the humming of a bee, and is not much larger than the humblebee; it can sustain itself a long time on the wing, and in that posture thrusts its little beak into flowers, the juices of which it sucks and feeds on. As it has no other food but this, there is no keeping it alive, but all die that are taken; and they are preserved and sent over as curiosities to us. Many have reported strange stories of their sleeping all the winter-months, and reviving at the approach of spring; but Margrave saw them in great plenty in the woods in all seasons. The Indians make pictures with the feathers of these birds, which are so brightly coloured, as to vie with the finest paint, and so thin as to be as close as colours on canvas. Ray's Ornithol. p. 165.

The *humming-bird* is so small, that its leg and foot together measure but half an inch, and its whole trunk not an inch. The body weighs only one-tenth of an ounce, which is about equivalent to a silver six-pence; whereas a titmouse, the smallest bird among us, weighs two billings, or half a crown. Its nest, which is made of cotton, is much of the size and figure of the thumb of a man's glove; its egg about the bigness of a pea. Some of the Indians wear them in their ears for pendants. Phil. Trans. N° 300. p. 760; and N° 306. p. 993; or Abr. vol. ii. p. 84. See Tab. III. of Birds, fig. 23.

HUMOR, or **HUMOUR**.

HUMORIS, or **HUMORIS**, the title of a celebrated academy of learned men at Rome. See **ACADEMY** of *Humorists*.

HUMOROSI, the name of an academy established at Cortona in Italy.

The *Humorists* of Cortona must not be confounded with the *Humorists* of Rome.

HUMOUR, or **HUMOR**, in its general sense, signifies the same as *liquor*, or *LIQUID*.

HUMOUR, in *Medicine*, is applied to any juice or fluid part of the body, as the chyle, blood, milk, fat, serum, lymph, spirits, bile, fecal, salivary and pancreatic juices, &c. See each of these under its proper head, **CITILE**, **BLOOD**, **BILE**, &c.

The four *humors*, so much talked of by the ancient physicians, are four liquid substances, which they suppose to moisten the whole body of all animals, and to be the cause of the divers temperaments thereof.

These are *phlegm*, *blood*, *bile*, and *melancholy*.

But the moderns do not allow of these divisions. The *humors* they rather choose to distinguish into *nutritive*, called also *elementary*; as chyle and blood; those separated from the blood; as bile, saliva, urine, &c. and those returned into the blood.

Humors, again, are distinguished into *natural*, or *salutary*, and *morbid* or *corrupted*. To the former class belong all the juices ordinarily secreted for the uses of the body.

To the latter belong those compound *humors*, which thickening and growing putrid, cause tumors, abscesses, obstructions, and most diseases.

These are distinguished by various names; *malignans*, *adul*, *corrosivum*, *cancerum*, *crudi*, *peccanti*, &c.

HUMOUR is also used for the particular temperament or constitution of a person, considered as arising from the prevalence of this or that *humor*, or juice of the body. Thus we say, a bilious, choleric *humor*; a phlegmatic *humor*; a melancholic, hypochondriac *humor*; a sanguine, gay, spiritous *humor*, &c.

HUMOURS of the *eye*. Anatomists and opticians distinguish three particular *humors* of the *eye*; which they call the *AQUEOUS*, *CRYSTALLINE*, and *VITREOUS*.

These three *humors* have each their share in the refraction of the rays of light necessary to vision.

Authors, both ancient and modern, speak of the regeneration of the *humors* of the *eye*; and give us instances of their reproduction, when, by any accident, they had been let out; but their influence, strictly considered, generally go no farther than to the aqueous and vitreous *humors*.

Borri only, in a letter to Bartholine, says as much of the crystalline. He asserts, that he has fit the pupil of the *eye* of divers animals, and squeezed out all the *humors*, even the crystalline, and afterwards perfectly restored

them again to sight; and that the *eyes* of the *birds*, whereon the operation had been performed, instead of being damaged thereby, were rendered more lively and vigorous than usual. He adds, that he had performed the same experiment on divers persons, with so much success, that there remained not the smallest appearance of cicatrix in the *eye*. See **CATARACT**.

HUMOUR is also used in *Dramatic Poetry*, for a subordinate species of what the critics call *manner*.

Humor is usually looked on as peculiar to the English drama, at least our comic poets have excelled therein, and carried it beyond those of any other nation; and our's is, perhaps, the only language that has a name for it.

Humor is usually considered by critics as a fainter or weaker habitual passion peculiar to comic characters, as being chiefly found in persons of a lower degree than those proper for tragedy.

Every passion may be said to have two different faces: one that is serious, great, formidable, and solemn, which is for tragedy; and another that is low, ridiculous, and fit for comedy; which last is what we call its *humor*.

We only become few characters: it is a breach of character, to make one half the persons in a modern, or indeed in any comedy, talk wittily and finely; at least at all times, and on all occasions. To entertain the audience, therefore, and keep the dramatic persons from going into the common, beaten, familiar ways and forms of speaking and thinking, recourse is had to something to supply the place of wit, and direct the audience, without going out of character; and this end is attained by *humor*, which therefore is to be looked on as the true wit and humor.

A very good judge, the duke of Buckingham, makes *humor* to be all in all: wit, according to him, should never be used, but to add an agreeableness to some proper and just sentiment, which, without some such turn, might pass without its effect.

HUMOUR, or *continued wit*, in *Oratory*, is a certain sprightliness and vivacity of thought, which runs through a discourse, and shews itself in agreeable images, beautiful turns, and a facetious manner of expression, suited to the subject, and affecting the hearers with pleasure and delight, though not to that degree as to excite laughter, or any great emotion of the passions.

HUMPHREY. See **GIBBOUS**.

HUMULUS, in *Biology*. See **HOP**.

HUNDRED, *centum*, *cent*, the number of ten times ten, or the square of ten.

The place of *hundred*, makes the third in order in the Arabic numeration.

We usually express the proportion of the profits made in the way of commerce, &c. by the *hundred*.

HUNDRED is also used as a measure to express a certain quantity or number of things. A hundred of salt at Amsterdam is fourteen tons.

Deal boards are sold at six score to the *hundred* called the *long hundred*. Pales and laths are counted at five score to the *hundred*, if five feet long; and six score, if three feet long.

HUNDRED weight, or the *great hundred*. See **QUINTAL**.

HUNDRED, *ducentis*. See **CENTUR**.

HUNDRED, **HUNDREDUM**, *centuria*, is also a part or division of a *shire* or *county*. It was so called, according to some, because each *hundred* found a *hundred* followers or followers of the king's peace, or a *hundred* able men of war.

Others rather think it to have been so called, because originally composed of a *hundred* families. It is true, Bracton tells us, that a *hundred* contains *centum villas*; but then Giraldus Cambrensis writes, that the Isle of Man hath three hundred and forty-three *villages*. In both these places the word *villa* must be taken for a country family; for it cannot mean a village, because there are not above forty villages in that island.

So, where Lombard tells us, that a *hundred* is so called, a *romani centum hominum*, it must be understood of a *hundred* men who are heads and chiefs of so many families.

Hundreds were first ordained by king Alfred, the twentieth king of the West Saxons; *Afredus rex* (says Lombard, *verbo centuri*) *ad id tam Gothicus Dani facti interat, prudensissimum olim Jethone Moysi dolum sanctus concilium, Angliam primas in septuaginta, centurias, & decurias partiti est*. Satriapum, *hyre*, a Syrian (*quoniam partem significat*) nominavit, *centuriam* hundred; *et decuriam*, *tribus* *sub* *tribus*, *i. e. decuriam* *collegium*, *appellavit*; *aque* *isidem* *nominavit* *vel* *hodie* *centurias*, &c. See **COUNTY** and **TITHING**.

This dividing of counties into *hundreds*, for the better government, king Alfred borrowed from Germany, where *cento*, or *centuria*, is a jurisdiction over a hundred towns. Such is the original of *hundreds*, which still retains the name,

name; though the jurisdiction be derived to the county-court, some few excepted, which have been by privilege annexed to the crown, or granted to some great subject, and to remain still in the nature of a franchise.

This has been ever since the stat. 14 Edw. III. whereby these hundred courts, formerly farmed out by the sheriff to other men, were all, or most part, reduced to the county-court, and so remain at present; so that where we read now of hundred courts, they are to be understood of several franchises, wherein the sheriff has nothing to do by his ordinary authority, except they of the hundred refuse to do their office.

If any homicide be committed, or dangerous wound given in the day-time, and the offender escape, the town shall be amerced; and if out of a town, the hundred shall be amerced. The hundred shall also make good the damages, in case of a robbery (see HUN and CRY), cutting banks or hop-binds, burning houses, barns, out-houses, herds, cocks, mowes, or stacks of corn, straw, hay, or wood; mines, or pits of coal, destroying granaries or corn intended for exportation; &c. destroying torpedies or works of navigable rivers, &c. 1 Geo. I. cap. 5. 9 Geo. I. cap. 22. 23 Geo. II. cap. 36. 8 Geo. II. cap. 32. 10 Geo. II. cap. 37. 11 Geo. II. cap. 22. 22 Geo. II. cap. 46.

HUNDRED, or **HUNDREDUM**, is sometimes also used for an immunity or privilege, whereby a man is quit of the hundred-penny, or customs, due to the hundred.

HUNDRED-wort. See COURT.

HUNDRED-light signifies the hundred-court, from which all the officers of the king's forest were freed by the charter of Canute.

HUNDRED suit, the payment of personal attendance, or delivering suit and service at the hundred-court.

HUNDREDERS, or **HUNDREDORS**, **HUNDREDARII**, are men impelled, or fit to be impelled, of a jury upon any controversy, dwelling within the hundred where the land in question lies.

HUNDREDA is also said for him who hath the jurisdiction of a hundred, and holds the hundred-court. See HEATHBOROUGH.

Sometimes it is also used for the bailiff of a hundred. See BATEIFF.

HUNEN, in the *Materia Medica*, a name given by some writers to the YUJUBE.

HUNGARIAN Machine, in *Hydraulics*, is represented Tab. IV. *Hydraulica*, fig. 40. In this figure AA, is the side of a hill, close by the brink of the shaft or mine-pit BB, which is 104 feet deep below the surface of the ground C at the foot of the hill. In this hill is a large spring of water, 143 feet above the surface of the ground at C (taken in perpendicular measure) and the spring affords much more water than what the spring D, under ground, lets into the mine.

A pipe EFG lets the water down from the spring in the hill, into a close air-tight vessel H that stands at the foot of the hill, and contains 571 cubic feet, or 43 gallons in wine measure. In this pipe is a cock a, which being opened or shut, lets the water of the spring run into H, or stops it, as occasion requires; and in H are two cocks b and c, the uppermost of which is for letting air into H, and the lowermost for letting the water out of it.

A small pipe I goes from the vessel H on the surface of the ground to a vessel K in the bottom of the mine, and terminates in the top thereof. This vessel is air-tight, and contains 271 cubic feet, or 2051 gallons in wine measure, which is forced up the ascending pipe LM, and runs off to waste, at N, above ground. The lower end of this pipe goes down so far into the vessel K, as almost to reach its bottom.

From this vessel, a pipe O goes to the spring D under ground, which lets water into the mine, and would overflow it if the water was not forced up, or raised from the mine, through the pipe LM. The pipe O lets this water into the vessel K when the cock a is turned open, and keeps back the water when the cock is shut.

The operation is as follows: the cock a being open, and the cocks b and c shut, and no water in the vessel K, open the cock d to let the vessel K fill with water from the spring in the mine. As this vessel fills, the water will drive the air out of it, up through the small pipe I into the vessel H, and all that air will go out of the vessel H by the open cock e, and then H will remain, as it was before, full of air in the same state of density as the common air is on the outside of H. When K is full of water, shut the cocks b and c, and open the cock a, to let water run down from the spring in the hill, by the pipe EF, into the vessel H. As the water rises in that vessel, the air will thereby be driven out of it, down through the pipe I, into the vessel K: and as this air is compressed by the weight of the running water in the pipe EF the

compressed air will force all the water out of the vessel K, up through the pipe LM, from which it will run off at N on the surface of the ground; and then the compressed air will rush out, after the water.

When the vessel K in the mine is emptied of water, and the air is heard to begin to rush out, shut the cock a to stop the water from the spring, and open the cocks b and c: then the water that came from the spring will run out of the vessel H by the cock e, and air will go in by the cock d: at the same time, open the cock a in the mine, to let the vessel K fill with water from D the spring in the mine; and as H empties, above-ground, K will fill below it; and the air that remained in K will (by the rising of the water in it) be driven back into the vessel H through the pipe I.

When H is empty of water, and K full, shut the cocks b, c, and d, and open the cock a: then H will fill with water from the spring in the hill; and this water, as it rises in H, will force the air out of H, down to the pipe I, upon the water in K; and the force of the compressed air will drive all the water out of K, up to the pipe LM, from which it will run off at N, as before.

And thus, wherever there is a spring in a hill, near a mine, that affords more water than what flows into the mine from a spring under ground; and the perpendicular height of the spring in the hill is greater than the depth of the mine, water may thus be raised from the mine, in a most simple and easy manner, by an engine in which there are neither pumps, pistons, nor valves: and such an engine will not be liable to be out of order, nor need repairs in many years.

But as there are very few mines that have hills near them with high springs, water cannot then be raised from them in this manner; and therefore Mr. Blakey proposed another method, which was, to make H an air-vessel, with a pipe going from it to another vessel in which is water, kept boiling by a fire under it, and this vessel to have a cock to let out the steam occasionally that rises from the surface of the boiling water. When the cock is shut, the steam will go off from the boiler into the air-vessel H, and drive the air out of it, down through the pipe I into the vessel K in the mine; and the force of the air compressed by the elasticity of the steam, will raise the water from K, up through the pipe LM, till K be emptied of water. Then the cock in the boiler is to be turned open, to let out the steam, and the cock d to be opened to let the vessel K fill from the spring in the mine: and when it is full, both these cocks are to be shut, and the operation will go on as before.

That Blakey's scheme would do, the Hungarian machine puts beyond all doubt. In both of them the vessels must be made very strong, because every part of each vessel, equal in surface to the bore of the ascending pipe LM, will sustain an outward pressure equal to the whole weight of water in that pipe. It will not answer for such depths as the common fire-engine will, nor will it raise so much water; but it may be built for less than a third part of the expence, and would answer very well where the depth is not above a hundred feet.

HUNGARICA hies, in the *Materia Medica*, a medicinal earth, commonly known by the name of *hies* TOCCAVI-TERRA.

HUNGARICUS morbus, a disease so called from its being first observed in the imperial army in Hungary, in the year 1566; from whence it spread over a great part of Europe.

It is described as a malignant fever, attended with sickness at the stomach, a pain and hardness about the epigastric region, great thirst from the beginning, a parched tongue, and a constant head-ach, ending in a delirium. It was highly contagious and mortal, and is supposed to have been a compound of the *ailurotis* and *hyspalis* fever, taking its life first in the camp, but acquiring that high degree of malignity from the foul air of the place in which the sick were crowded. Priege, Observ. on the Diseases of the Army, p. 118, & seq.

HUNGARY water, *Aqua HUNGARICA*, a distilled water, so denominated from a queen of Hungary, for whose use it was first prepared, and who was cured by the continued use of it, of a paralytic disorder.

Hungary-water is one of the distilled waters of the Shops; and is directed, in the college dispensatory, to be made of ROSEMARY-flowers infused some days in rectified spirit of wine, and the spirit then distilled. The college of Edinburgh directs a gallon of rectified spirit, to be drawn over in the heat of a water bath from two pounds of the flowers as soon as they are gathered; that of London takes the tops and a spirit not quite so strong; putting a gallon of proof spirit to a pound and a half of the fresh tops, and drawing off in the heat of a water-bath five pints.

It is an agreeable perfume, and its virtues are much the same as those of the fimple it is drawn from. The *Hungary* water brought from France is more fragrant than such as is generally prepared among us.

HUNGER, *famur*, a natural appetite or desire of food. *Hunger* is properly distinguished into *natural* and *animal*. *Natural hunger* is an irritation of the stomach, occasioned by fasting; *animal hunger* is the sensation or perception of that irritation, and the desire of food consequent thereon.

There are various opinions as to the nature, cause, and definition of *hunger*; the point having been controverted from Aristotle to our time. Galen defines it, a painful sensation, arising from a distention of the stomach; the other Peripatetics call it an appetite, or desire, of hot and dry, which two (silent some authors have conceived to resemble, by taking them both in), and, accordingly, define *hunger* a natural appetite of hot and dry, occasioned by a painful distention of the membranes of the stomach, arising from its emptiness.

The modern philosophers speak much more accurately and intelligibly on the point. *Hunger* is generally considered, by them, as owing to the sharpness or acrimony of the liquor contained in the stomach; which, reflecting its fires, occasions this uneasy sensation. They add, that the occasional cause of this reflection is, the emptiness of the stomach; which not furnishing food for the stomach-liquor to be employed on, exposes its inner membrane to the action thereof.

In effect, it is generally agreed, that there is some menstruous juice, or humour, continually discharged from the excretory ducts of the neighbouring glands into the stomach, to assist in the dissolution and digestion of the food; and that this liquor, after the food is gone, falls upon the stomach itself, and irritates its nerves so strongly, as to propagate the impression to the brain, and thus produce the perception of *hunger*.

This juice some will have to be acrid, because bodies of that class are used to whet the appetite, and excite *hunger*; and that fatty bodies more readily remove it than others, by their adhering to the acid spicula, and blunting the points of them.

Others, denying the existence of any such stomach-liquor, and accounting for digestion without it; consequently deny *hunger* to have any dependence thereon. The dry attrition of the coats of the stomach, according to them, is the only cause of it.

On both these principles, they lay, it is, that the Indians elude their fever, by swallowing pills, made of tobacco-leaves and calcined shells. These pills take away the appetite; both as the tobacco leaves gradually diminish the sensibility of the stomach; and as the calcined shells absorb the saline-acid menstruum. Thus also it is, that poor people frequently smoke tobacco to decieve their *hunger*, not to satisfy it; for tobacco affords no nutriment; but it occasions a plentiful spitting, and by this means discharges the body of the acrid humour which causes *hunger*.

The latter system Dr. Drake thus lays down: when all the chyme and chyle is pressed out of the stomach, it follows the motions of its contents, and is again, by means of its muscular coat, reduced to a state of contraction; and by that means the inner coat is brought to lie in folds, which touching and, by means of the peristaltic motion, rubbing lightly, upon one another, produce the gentle sense of fretting, or vellitation, which we call *hunger*; which being felt much in the upper orifice, which is first executed, begins there to prompt us to replenish; but as, by degrees, the remainder of the contents are expelled, this friction, or rubbing of the membranes upon each other, spreads gradually over the whole stomach, and renders our *hunger* more urgent and impatient, till, by a new replenishment, we take away the cause.

Others think the blood, derived from the adjacent ramifications of the arteria into the stomach, sufficient to account for *hunger*, without the mediation either of the attrition, or the menstruum. The mass of blood itself, they observe, is rendered acid through abstinence from food; its soft balsamic parts having been carried into all parts of the body, and lodged therein as nutriment, to supply the absence of those worn off, and exhausted: to which it may be added, that the velocity of the blood is considerably augmented, a good while after eating, beyond what it was during the action of digestion.

Hence it is, 1. That persons of a bilious constitution, young people, and those who labour hard, must sooner find themselves *hungry* than others. 2. That *hunger*, if it hold long, occasions a violent heat, and even sometimes a fever. 3. That those whose humours are crass and viscid, are less incommoded with *hunger* than others.

In effect, we observe, that some animals, whose humours

are found to have those conditions, as tortoises, &c. will live a long time without food. For men, six or seven days are commonly supposed the limit within which, if he take no solid food, he dies; though we have instances of abstinence which far surpass this. See *ASTHENIA*, *ROBURY*, and *DIET*.

HUNGRY *evil*, a term used among the farmers for the same distemper in horses, which in men we call a canine appetite. It manifests itself sedulously in an insatiable desire to eat, and is sometimes the effect of long starving, sometimes of cold, or some other internal or external cause. In the latter case the horse will only eat a large quantity, but he devours it in a very remarkable manner, chewing it up as if he would eat the very manger. The method of cure is to give him large handfuls of bread steeped in sack, or some other sweet wine; or give him a quantity of wheat flour in wine, or in milk, a quart or more at a time. There are very good remedies in case of extremity, but otherwise it may be cured by feeding him moderately with bean bread several times a day, allowing no other food.

HUNTER, a name given to a horse qualified to carry a person in the chace. The shape of the horse designed for this service, should be strong and well knit together, as the jockies expect it. Irregular or unequal flaps in these creatures, are always a token of weakness. The inequalities in shape which the horse is improper for the chace, are the having a large head and a small neck, a large leg and a small foot, and the like. The head of the *hunter* should indeed always be large, but the neck should also be thick and strong to support it. The head should be lean, the nostrils wide, and the windpipe straight.

The *hunter*, in order to his behaving well in the field, ought to have great care and indolence in the stable: he ought to have as much rest and quiet as may be, to be kept well supplied with good moist, clean litter, and fresh water by him; he should be often drenched, and suffered to sleep as much as he pleases. He should be so fed that his dung may be rather soft than hard, and it must be of a bright and clean colour. All this may be easily managed by the constant difference and change of his food, as occasion requires. After his usual feedings he should have exercise and mashes of sweet mast, or bread and beans; or wheat and beans mixed together, are to be his best food, and beans and oats his worst.

Some very great fortitudes are for keeping their horses out at grass all the back-churning season, over-taking them up into the stable at all, but allowing them in the field as much oats with their grass as they will eat. The horse may be thus rid three days in the week for the whole season, and never damaged by it, nor ever showing any marks of harm afterwards.

The whole shape of a horse intended for a *hunter*, should be this: the ears should be small, open, and pricked; or though they be somewhat long, yet if they stand up erect, and hold like those of a fox, it is a sign of toughness or hardiness. The forehead should be broad and broad, not flat; or, as it is usually termed, *mare-faced*, but rising in the middle like that of a hare; the forehead should be placed above the eye, the contrary being thought by some to threaten blindness. The eyes should be full, large, and bright; the nostrils not only large, but looking red and fresh within; for an open and fresh nostril is always esteemed a sign of a good wind. The mouth should be large, deep in the wicks and hairy. The windpipe should be large, and appear straight when he bridle his head; for if, on the contrary, it bends like a bow on his bridling, it is not formed for a free passage of the breath. This defect in a horse is expressed among the dealers by the phrase *cock-throated*. The head should be so set on to the neck, that a space may be felt between the neck and the chine; when there is no such space, the horse is said to be *hull-necked*, and this is not only a blemish in the beauty of the horse, but also occasions his wind not to be so good. The crest should be strong, firm, and well risen; the neck should be straight and firm, not loose and pliant; its breast should be strong and broad, the ribs round like a barrel, the flanks large, the buttocks rather oval than round, the legs clean, flat and straight; and, finally, the mane and tail ought to be long and thin, not short and bushy, the last being counted a mark of dullness. When a *hunter* is thus chosen, and has been taught such obedience, that he will readily answer to the rider's sign of both of the bridle and hand, the voice, the cull of the leg, and the posture that he knows how to make his way forward, and has gained a true temper of mouth, and a right placing of his head, and has learned to stop and to turn readily, if his age be sufficiently advanced, he is ready for the field. It is a rule with all staunch sportsmen, that no horse should be used in hunting till he is full five years old; some will hunt them at four, but the horse at this time is not come

up to his true strength and courage, and will not only fail at every tough trial, but will be subject to strains and accidents of that kind, much more than if he were to be kept another year first, when his strength would be more confirmed.

When the horse is five years old, he may be put to graze from the middle of May till Bartholomew-tide; for the weather between these is so hot, that it will be very proper to spare him from work. As Bartholomew-tide the strength of the grain beginning to be nipped by frosts and cold dews, so that it is apt to engender crickets in the horse, he should be taken up, while his coat is yet smooth and sleek, and put into the stable. When he is first brought home, he should be put in some secure and spacious place, where he may vacuate his body by degrees, and be brought not all at once to the warm keeping; the next night he may be rubbed up. It is a general rule with many not to alter and change up their horses till two or three days after they are taken from graze, and others who put them in the stable after the first night, yet will not dress and clothe them till three or four days afterwards; but all this, except the keeping the horse one day in a large and cool place, is needless caution.

There is a general practice among the grooms, in many places, of giving their horses wheat-straw as soon as they take them up from graze. They say they do this to take up their bellies, but there seems much reason to disapprove of this. The change is very violent, and the nature of the straw is heating and drying, that there seems great reason to fear that the strongest nature of it would be prejudicial, more than is at first perceived. It is always found that the dung is hard after this food, and is voided with pain and difficulty, which is in general very wrong for this sort of horse. It is better therefore to avoid this straw-feeding, and to depend upon moderate airing, warm clothing, and good old hay, and old corn, than to have recourse to any thing of this kind.

When the horse has vacated all his graze, and has been properly food, and the shoes have had time to settle to his feet, he may be ridden about, and treated in this manner: the groom ought to visit him early in the morning at five o'clock in the fine days, and at six in the short ones; he must then clean out the stable, and feed the horse's neck, back and belly, to find the state of his health. If the back feels soft and fleshy, there is a necessity of good diet to harden it, otherwise any great exercise will occasion twellings and goutiness of the heels. After this examination, a handful or two of good old oats, well sifted, should be given him: this will make him have more inclination to water, and will also make the water fit better on his stomach, than if he drank fasting. After this he is to be tied up and dressed. If in the doing of this he opens his mouth, as if he would bite, or attempts to kick at the person, it is a proof that the teeth of the cur-comb are too sharp, and must be filed blunter. If after this he continues the same tricks, it is through wantonness, and he should be corrected for it with the whip. The intent of curbing being only to raise the snuff, this is to be braced off afterwards with a horse-tail nailed to a handle, or any other light bridle. Then he is to be rubbed down with the brush, and dished a second time: he should then be rubbed over with a wet hand, and all the loose hairs, and whatever foulness there is, should be picked off. When this is done, and he is wiped dry as at first, a large fiddle-cloth is to be put on, reaching down to the flaring place; then the fiddle is to be put on, and a cloth thrown over it that he may not take cold: then rub down his legs, and pick his feet with an iron pickler, and let the mane and tail be combed with a wet mane-comb. Lastly, it is a custom to spit some beer in his mouth just before the leading him out of the stable. He should then be mounted, and walked a mile at least to some running water, and there watered; but he must only be suffered to take about half his water at one drinking.

It is the custom of many to gallop the horse at a violent rate as soon as he comes out of the water, but this is extremely wrong for many reasons. It endangers the breaking a horse's wind more than any other practice, and often has been the occasion of hurting very good horses. It is then also to the disgraceful trick we find in many horses, of running away as fast as they come out of the water; and with some it makes them averse to drinking, so that they will rather endure thirst, and burn themselves greatly by it, than bring on the violent exercise which they remember always follows it. The better way is to walk him a little after he is out of the water, then put him to a gentle gallop for a little while, and after this to bring him to the water again. This should be done three or four times, till he will not drink any more. If there is a hilly place near the watering place, it is always well to ride up to it; if otherwise, any place

is to be chosen where there is free air and sun. That the creature may enjoy the benefit of this, he is not to be galloped, but walked about in this place an hour, and then taken home to the stable. The pleasure the horse himself takes in these airings, when well managed, is very evident, for he will gaze, yawn, and thrug up his body; and in these, whenever he would stand still to stare, dangle, or listen to any noise, he is not to be hindered from it, but encouraged in every thing of this kind.

The advantages of these airings are very evident, they purify the blood, teach the creature how to make his breathing agree with the rest of the motions of his body, and give him an appetite to his food, which *horses* and *racers*, that are kept stalled up, are otherwise very apt to lose. On returning from airing the litter of the stable should be fresh, and by stirring this, and whistling, he will be brought to sleep. Then he is to be led to his stall, and tied up, and again carefully rubbed down; thereby should be covered with a linen cloth next his body, and a canvas one over that, made to fit him, and reaching down to his legs. Thus, as the duke of Newcastle observes, is a custom which we learn of the Turks, who are of all people the most nice and careful of their horses. Over this covering there should be put a body-cloth of six or eight straps; this keeps his belly in shape, and does not hurt him. This clothing will be sufficient while the weather is not very sharp, but in severe seasons, when the hair begins to rise and start in the uncovered parts, a woollen cloth is to be added, and this will always prove fully sufficient.

Different horses and different seasons, make variety of the degree of clothing necessary, but there always is an obvious rule to point out the necessary changes, the roughness of the coat being a mark of the want of clothing, and the smoothness of it a proof that the clothing is sufficient. Therefore if at any time the hair is found to start, it is a notice that some farther clothing is to be added.

If the horse sweat much in the night, it is a sign that he is over fed, and wants exercise; this therefore is easily remedied. An hour or more after the horse is come in from his airing, the groom should give him a whip of clean hay, making him eat out of his hand; after this let the manger be well cleaned out, and a quartern of oats clean sifted be given him. If he eats up this with an appetite, he should have more given him; but if he is slow and indifferent about it, he must have no more. The business is to give him enough, but not to cloy him with food.

If the horse get flesh too fast on this home feeding, he is not to be stinted to prevent it, but only his exercise increased; this will take down his flesh, and at the same time give him strength and wind. After the feeding in the morning is over, the stable is to be shut up, only leaving him a little hay on his litter. He need be no more looked at till one o'clock, and then only rubbed down, and left again to the time of his evening watering, which is four o'clock in the summer, and three in the winter. When he has been watered, he must be kept out as long as two, or more if necessary, and then taken home and rubbed as after the morning watering. Then he is to have a feed of corn at six o'clock, and another at nine at night; and being then clothed, and his litter put in order, and lay enough left for the night, he is to be left till morning. This is the direction for one day, and in this manner he is to be treated every day for a fortnight, at the end of which time his flesh will be so hardened, his wind so improved, and his mouth so quickened, and his gallop brought to so good a frock, that he will be fit to put to moderate hunting. During the time that he is used to hunting, he must be ordered on his days of rest exactly as he is directed for the fortnight when he is in preparation; but as his exercise is now greatly increased, he must be allowed a more strengthening food, mixing some old split beans at every feeding with his oats.

And if this is not found to be sufficient, the following bread must be given: let two pecks of old beans, and one peck of wheat be ground together, and made into an indifferently fine meal; then knead it into dough with some warm water, and a good quantity of yeast. Let it lie a time that it may rise and swell, which will make the bread the lighter; then make it into loaves of a peck each, and let it be baked in a slow oven, that it may be thoroughly done without being burnt; when it is taken out of the oven, it must be set bottom upwards to cool; when it is one day old the crust is to be clipped off, and the crumb given him for food. When this is ready, he should have some of it at least once in the day; but it is not to be made the only food, but some feeds are to be of oats alone, some of oats and this bread, and some oats and beans mixed together. The mashing a variety

a variety in this manner, being the best of all methods of keeping up the appetite, which is often apt to fail.

The day before the horse is to hunt, he must have no beans, because they are hard of digestion, but only some oats with this feed; or if he will be brought to eat the bread alone, that will be best of all. His evening feed should, on this day, be somewhat earlier than usual; and after this he is only to have a wisp of hay out of the groom's hand till he return from HUNTING.

HUNTING, the art, or act, of pursuing and chasing beasts of game.

In its general sense, *hunting* includes the pursuit both of hairy and feathered game; but in its more proper and restrained signification, it is only applicable to beasts of venery and chase.

F. de Launay, professor of the French laws, has an extensive treatise of *hunting*. We find, that, among the more civilized nations, as the Persians, Greeks, and Romans, it always made one of their gentlerer diversions; and as to the wilder and more barbarous, it served them with food and necessities. The Roman jurisprudence, which was formed on the manners of the first ages, made a law of it, and established it as a maxim, that as the natural right of beasts, which have no master, belongs to the first possessor, wild beasts, birds, and fishes, are the property of him, whoever he be, that can first take them.

But the northern nations of barbarians who over-ran the Roman empire, bringing with them a stronger taste for the diversion; and the people being now possessed of other and more easy means of subsistence from the lands and possessions of their they had vanquished, their chiefs and leaders began to appropriate the right of *hunting*, and instead of a natural right, to make it a royal one. Thus it continues to this day; the right of *hunting*, among us, belonging only to the king, and those who derive it from him.

And hence have arisen all our laws and charters of the forest, laws and regulations for preservation of the game, &c. See FOREST.

The *hunting* used by the ancients was much like that now practised for the rein deer; which is seldom hunted at force, or with bounds; but only drawn with a bloodhound, and forthwith with nets and engines. Thus did they with all beasts; whence a dog is never commended by them for opening, before he has discovered where the beast lies; hence, they were not in any manner curious as to the music of their hounds, or the composition of their kennel or pack, either for deepness, loudness, or sweetness of cry, which is become a principal point in the *hunting* of our days.

Their hunters, indeed, were accustomed to shoot and make a great noise, as Virgil observes in the third of his *Georgics*: *invenit clamore procer ad riva coram*. But that clamour was only to bring the deer to the nets laid for him.

The Sicilian way of *hunting* had something in it very extraordinary. The nobles or gentry being informed which way a herd of deer passed, gave notice to one another, and appointed a meeting; every one bringing with him a cross-bow or long-bow, and a bundle of flaves shod with iron, the heads bored, with a cord passing through them all; thus provided, they came to the herd, and calling themselves about in a large ring, surrounded the deer. Then, each taking his stand, unbound his fagot, let up his flake, and tied the end of the cord to that of his near neighbour, at the distance of ten feet from one another. Then taking fesslers, dyed in crimson, and fastened on a thread, they tied them to the cord, so that with the least breath of wind they would whirl round. Which done, the persons who kept the stands withdrew, and hid themselves in the next covert.

Then the chief rangers entering within the line with bounds to draw after the herd, roared the game with their cry; which flying towards the line, were turned off, and still gazing on the shaking and shining fesslers, wandered about as if kept in with a real wall or pale.

The ranger still perfect, and calling every person by name, as he passed by their stand, commanded him to shoot the first, third, or sixth, as he pleased; and if any of them missed, or singled one another than that assigned him, it was counted a grievous disgrace.

By such means, as they called by the several stations, the whole herd was killed by the several hands.

Hunting is practised in a different manner, and with a different apparatus, according to the nature, genius, and address, of the particular beast which is the object thereof. These beasts are, the hart, hind, hare, boar, wolf, buck, doe, fox, marten, and roe; the five first whereof

are denominated beasts of the forest, or venery, *huntsman*; and the five latter, beasts of the field, or of chase, *completers*.

The gentlemen, and masters of the sport, have framed a new set of terms, which may be called the *hunting language*; a little view or vocabulary whereof we shall here give the reader.

The terms, then, used for beasts of venery and chase, as they are in company, are these: they say, a *herd* of harts, and all manner of deer; a *troop* of roes; a *flounder* of hinds; a *rust* of wolves; a *rabble* of martens; a *brace* or *leash* of bucks, foxes, or hares; a *couple* of rabbits or conies.

There are also terms for their lodging: a hart is said to *barrow*; a buck, *lodge*; a roe, *bed*; a hare, *den*, or *form*; a coney, *fit*; a fox, *den*; a marten, *tree*; an otter, *whor*; a badger, *earth*; a boar, *cocker*.

Hence, to express their dislodging, they say, *unbarrow* the hart; *rust* the buck; *flout* the hare; *bed* the coney; *unrust* the fox; *rust* the marten; *rust* the otter; *dig* the badger; *rust* the boar.

The terms for their noise at setting time are as follows: a hart *bellows*; a buck, *groans* or *trants*; a roe, *bellows*; a hare, *howls* or *roars*; an otter, *whorrs*; a boar, *groans*; a fox, *howls*; a badger, *bellows*; a wolf, *howls*; a goat, *roars*.

Terms for their copulation: a hart or buck, goes to *est*; a roe goes to *mark*; a bear goes to *brim*; a hare or coney goes to *bed*; a fox goes to *chide*; or a wolf goes to *match* or *mate*; an otter *banth* for his kind.

Terms for the footing and readings of a hunt, we say, the *start* of a buck, and all fallow deer, the *view* of all deer, if on the grass, and scarce visible, the *seeing*; of a fox, the *point*; and of other the like, *seeing*, the *seeing*; of an otter, the *marks* of a boar, the *track*; the hare, when in open fields, is said to *fly*; when the huntsman about to deceive the hounds, the *double*; when the beats on the hard highway, and her footing comes to be perceived, the *prichit*: in fow it is called, the *trace* of the hare.

The tail of a hart, buck, or other deer, is called the *flag*; that of a boar, the *weald* of a fox, the *beak* or *drag*; and the tip at the end, the *chapel* of a wolf, the *stem*; of a hare and coney, the *fat*.

The ordure or excrement of a hart, and all deer, is called *sewer* or *sewering*; of a hare, *crates* or *cratling*; of a boar, *loss* of a fox, the *billings*; and of other the like vermin, the *sewer* of an otter the *sewer*. As to the heads of deer, something has already been spoken under the article HEAD.

For the attire or parts thereof, those of a stag, if perfect, are, the *horn*, the *pearls*, the *little horns*, the *horns*, the *gators*, the *nutlet*, the *foremost*, *crystal*, *foremost*, and all at top, the *crystal* of the buck, the *eye*, *horn*, *breast-antler*, *back-antler*, *advanter*, *palm*, and *poller*.

If the crochets grow in the form of a man's hand, it is called a *palmed head*. Heads bearing not above three or four, and the crochets placed aloft, all of one height, are called *crooked heads*. Heads having double crochets, are called *forked heads*, because the crochets are planted on the top of the like forks.

They say a *litter* of cubs; a *nest* of rabbits; a *squirrel's* *dray*.

The terms used in respect to the dogs, &c. are as follow: of greyhounds, two make a *bray*; of hounds, a *couple* of greyhounds, three make a *leash*; of bounds, a *couple* and *half*; they say, *let slip* a greyhound; and *cast off* a hound: the string when a greyhound is led is called a *lead*; and that of a bound a *lyme*: the greyhound has his *collar*, and the bound his *couplet*: we say a *band* of hounds, and a *pace* of hounds.

Hunting considered as an exercise, is perhaps the best that can possibly be contrived for strengthening the general habit, and procuring health and vigour. The season of the year, the time of the day destined for this amusement, and the motion necessary on this occasion, are all admirably adapted to the restoration and continuance of health. It is besides of no small importance to have the mind recreated at the time the body is exercised; for this admirably affords the due circulation of the fluids through the minute canals destined for their conveyance; and there are few people not utterly abandoned to idleness and debauchery of some kind or other, who do not perceive a spontaneous flow of spirits when they ride at or about the rise of the sun, when they respire the purest air, when variety of perpetually changing scenes present themselves, and when the mind is greatly agitated concerning the event of the chase.

Hunting, *style* or *manner* of, are various, according to the country, the beast, and the means whereby he is to be caught.

Hunting,

Hunting, as practised among us, is chiefly performed with dogs, of which we have various kinds, accommodated to the various kinds of game: as *hounds, greyhounds, flush-hounds, blind-hounds, terriers, &c.* See **HOUNDS**.

In the kennels or packs, they generally rank them under the heads of *masters, drivers, spears, &c.* On some occasions, rats, ferrets, and instruments for digging the ground are also required: not is the *hunting* born to be misused.

The usual chase among us are, the *hare, buck, fox, hare, fox, badger, and stoat*. We shall here give something of what relates to each of these.

With regard to the seasons of *hunting*, *hart* and *buck* *hunting* begins at the end of fence-month, which is a fortnight after Midsummer, and lasts till Holy-rood-day. The *hind* and *roe* come in course on Holy-rood-day, and last till Candlemas. *Fox* *hunting* comes in at Christmas, and holds till Annunciation.

Roe *hunting* begins at Michaelmas, and ends at Candlemas. *Hare* *hunting* commences at Michaelmas, and goes out at the end of February. Where the *wolf* and *boar* are *hunted*, the *season* for each begins at Christmas, the first ending at the Annunciation, the second at the Purification.

Here, too, is the place for some general terms, and phrases, more immediately used in the progress of the sport itself, which belongs to the general terms of game in particular, being referred for the respective articles.

When the hounds then being call off, and finding the scent of some game begin to open and cry, they are said to *challenge*; when they are too busy before the scent be good, they are said to *scold*; when too busy where the scent is good, *in-bowls*, when they run it cross-ways orderly, holding in together merrily, and making it good, they are said to be in *fall cry*; when they run along without opening at all, it is called *running merrily*.

When *fly-micks* open in the firing, or a greyhound in the course, they are said to *sooty*.

When *legles* *hart* and *stag* at their prey, they are said to *prance*.

When the dogs hit the scent the contrary way, they are said to *draw away*.

When then they take fresh scent, and quit the former chase for a new one, it is called *hunting change*.

When they hunt the game by the heel or track, they are said to *hunt counter*.

When the chase goes off, and returns again, travelling the same ground, it is called *hunting the fall*.

When the dogs run at a whole herd of deer instead of a single one, it is called *running riot*.

Dogs let in readiness where the game is expected to come by and call off after the other hounds are pulled, are called a *relay*. If they be call off before the other dogs be come up, it is called a *traveller*.

When, finding where the chase has been, they make a pretence to enter, but return, it is called a *horny*.

A lesson on the horn to encourage the hounds, is named a *call* or *renewal*. That blows at the death of a deer, is called the *mist*. The part belonging to the dogs of any chase they have killed, is the *prize*. They lay, take off a deer's skin; *strip* or *skin* a hare, *fox*, and all sorts of venison; which is done by beginning at the throat, and turning the skin over the ears, down the tail.

HUNTING, *how* relating to. See **GAME**.

Notwithstanding all the game laws, and the various qualifications for *hunting* pointed out by statutes, which imply a power for persons to qualified to *hunt*, yet, according to Judge Blackstone, no man but he who has a chase, or free-warren by grant of the crown or prescription, which supposes one, can justly *hunting* or sporting upon another man's soil, nor indeed, in thorough strictness of common law, either *hunting* or sporting at all. Persons to *hunting* are liable to actions of trespass by the possessor of the land. Comment. vol. iii. p. 418. and vol. iv. p. 174.

HUNTING, *Badgers*. A badger is called by several names, viz. a *grey track, berron, or berron*: the male is called a *badger* or *berron*, and the female a *fox*. See **BADGER**. This beast is very frequent in Italy, Sicily, the Alpine, and Helvetian coasts, and is not uncommon in France and England.

The badger is a very sleepy beast, especially in the day-time, seldom stirring about in the night; whence the denomination *badger*, *q. d. sceleratus of the light*. It burrows under-ground like the *fox*, and forms several different apartments, though with only one entrance, carrying in its mouth gravel in order to form a bed for its young. It is to be clearly an animal, that is never above the call of nature in its apartments, but goes out for that purpose. It breeds only once in a year, and brings four or five at a time.

The badger is a deep-biting beast, having very sharp teeth; to guard against the effects whereof, it is usual to put great brass collars about the dogs' necks. He fights on his back, and by this means is at liberty to use both his teeth and nails. He has a faculty of blowing up his skin after a strange manner, by which he defends himself against any blow or bite of the dogs; so that you may thrust on his back till you are weary to no purpose; but a small stroke on the nose dispatches him presently.

The skin of the badger when dressed with the hair is used for pillow furniture. The Highlanders make their pendant pouches of it. The hair is often used for making brushes to finish the shades in painting, called *twentynine tools*. These animals are also hunted in the winter months for the sake of their flesh, for the hind quarters may be made into hams, not inferior in goodness to the best bacon. The fat is much valued for ointments and salves.

The method of *hunting* the badger is thus: seek the earth and burrows where he lies, and in a clear moon-shine night go and stop all the holes but one or two, and therein place facks, furnished with drawing-strings, which may shut him in as soon as he strains the bag. The bags thus set, call off your hounds, and beat all the groves, hedges, or tufts, within a mile or two: what badgers are abroad, being alarmed by the dogs, will straight repair to their earths, and so be taken. He that stays to watch the facks must stand close, and upon a clear wind; or else the badger will find him, and by some other way for safety. If the hounds either encounter him, or undertake the chase before he can get into his earth, he will stand at bay like a *boar*, and make excellent sport. If the badger be stung in his ear, as soon as he perceives the terrible yell him, he will stop the hole between the dogs and himself, and if the dogs continue baying he removes his baggage with him, and goes into another apartment or chamber, of which he usually has half a dozen in the burrow; thus retreating from one to the other, till he can go no farther, and terminating the way as he goes. In *hunting* the badger as well as the *fox*, a man cannot justify breaking the soil, and digging him out of his earth.

HUNTING, *Duck, or hunting falcons* &c. See **BUCK**.

The female is called *doe*, or *do*; the first year, a *faun*; second, a *egg*; the third, a *do*. See **DEER**. This beast is common in most countries, being as corpulent as a *hart*, but in most things resembling more a *roe*, except in colour; which is various, but most commonly branded, or fawn on the back, having a black list all along the ridge, and the belly and sides spotted with white.

The male has horns not much differing from a *hart*, except in largeness, and they grow out of the head like fingers out of the hand; whence it is called *crucis palmatus*. The female is without horns.

Less art and skill are required in lodging a *buck* than in harbouring a *hart*; nor does there need so much drawing after: it is sufficient that you judge by the view, and mark what grove or covert he enters; for he does not wander and rove so often as a *hart*, nor so frequently change his layer. When hard hunted he usually takes to some strong hold or covert, with which he is acquainted; not lying far before the hounds, nor crossing nor doubling, nor using any of the subtleties the *hart* is accustomed to.

The *buck* will beat a brook, but seldom a great river as the *hart*; nor can he stay so long at bay.

The greatest folly of a huntsman need use in *hunting* the *buck* is to beate of *hunting* counter or change, because of the plenty of fallow deer, which are to come more directly upon the hounds than the red deer do.

The *buck* herds more than the *hart*, and both in the driest places; but if he be at large, unconfined in a park, he herds but little from May to August, because the flies trouble him. He takes delight in hilly places, but chooses the dales to feed in.

HUNTING, *fox*. This animal, the first year, is called a *cub*; the second, a *fox*; the third, an *old fox*. See **FOX**. His nature in many respects is like that of a wolf; and both bring the same number of cubs at a litter; but the *fox* litters deep under ground, which the wolf does not.

A bitch *fox* is hard to take when braggard and with cub, in regard she lies near her burrow, into which she runs upon hearing the least noise: indeed it is no easy matter to take her at any time, as being a beast of exceeding sulkiness. What makes *fox-hunting* the more entertaining is, the strong but keen this creature smells, which keeps up an excellent cry; but as his scent is hotter at hand, so it dies sooner than that of a *hare*, &c. Add, that he never lies far before the hounds, as not tending to his legs, or the champagne ground, but has recourse to the strongest coverts.

verts. When he can no longer stand up before the hounds, he takes earth, and moults dug out. When courted by grey-hounds on a plain, his last refuge is, usually, to pish on his tail, and flip it in their faces as they come near him; sometimes squinting also his thicker extremity upon them, to make them give over their course.

When a bitch fox goes a clucking, and feels the dog, she cries with a hollow voice, not unlike the howling of a mad dog; and the like noise she makes when she sniffs any of her cubs; but she never cries at all when she is about to be killed, but defends herself in silence to the last gasp.

The fox is taken with hounds, grey-hounds, terriers, nets, and gins. Of terriers there are two sorts: the one crook-legged, and commonly short-haired, which take earth well, and lie long at fox, or badger; the other is thugged, and flat-legged, which will not only hunt above ground as others, but also enter the earth with great fury, though they cannot stay in so long, on account of their vehemence.

The fox chafes to earth in ground hard to dig; as in clay, or stony ground, or amongst the roots of trees; and his earth has commonly but one hole, which goes straight along in, before it comes at their couch: he sometimes by craft possesses himself of a badger's old burrow, which has variety of chambers, holes, and angles. Gesner relates, that he frequently chafes the badger of his habitation, by laying his excrement at the mouth of the other's burrow.

HUNTING, hare. A hare the first year is called a *luree*; the second year, a *hare*; the third, a *great hare*. See **HARE**.

Those of the mountains are the most swift, and those of the marshes the slowest; the wintering hares are the most difficult and dangerous to follow.

Each part and member of the hare is formed for celerity. The head is round and short, of a convenient length; the ears long and lofty, to hear the enemy at a distance, and save itself in time; the lips continually move, sleeping and waking; and the eye is too big and round for the lid to cover it, even when asleep; so that the creature sleeps as it were on the watch. The breast is capacious, and fitted to take more breath than that of any other beast. They feed abroad, to conceal their forms; and never drink, but content themselves with the dew. The hare's ears lead the way in her chase; for with one of them she hearkens to the cry of the dogs, the other being stretched forth like a sail to promote her course.

The hares of the mountains often exercise themselves in valleys and plains, and through practice grow acquainted with the nearest way to their forms: those which frequent bushes and brakes, are not able to endure labour; nor are very swift, being tender-footed, and growing fat through discontinuance of exercise.

When the hare has left the dog far behind, she goes to some hill or rising ground, where, rearing on her hinder legs, she observes at what distance her pursuers are.

The scent is naturally stronger in wood-hares than field-hares; but in all sorts it is strongest when they feed on green corn. In winter mornings, the scent does not lie till the frost be a little thawed; and it may be added, that a hare always leaves more scent when she goes to relief, than when she goes to form.

Her footsteps are more keen in winter than summer; because as the nights are longer, they travel farther. Their prints are very uncertain at the full moon, at which time they leap and play together. The young, it is to be observed, tread heavier than the old, because their limbs are weaker. A buck, or male hare, is known by his beating the hard highways, feeding farther out in the plains, and making his doublings of a greater compass than the female, who keeps close by some covert side; turning, winding, and crouching in the bushes, like a coney, and rarely running out an end; whereas the buck, having once made a turn or two about his form, then farwel turns; for he will frequently lead them five or six miles without once turning his head. Add, that the buck is known, at his rising out of form, by his hinder parts, which are more white, and his shoulder, which is redder than the doe's.

The hare regulates its conduct according to the weather. In a moist day she holds the highways more than at any other time, because the scent is then most apt to lie; and if she come at the side of any young grove or spring, she forbears to enter, but squats down aside thereof, till the hounds have overtopped her; upon which she returns the same way she came, without turning into any covert; for fear of the wet and dew hanging on the boughs.

Regard is also to be had to the place where the hare sits, and upon what wind; for if her form be either upon the north or south wind, she will not willingly run into the wind, but aside, or down the wind; on the contrary, if

the form in the water, it is a sign she is fool and straggled; and in the course will make all her doubling and crouching about brook-sides, and near plashes; for her intent, under this condition, being very strong, she needs a place that will take but little. Sometimes, when hanged down, she will start a fresh hare, and squat in the same form; at other times she will creep under the door of a sheep-cote, and hide among the sheep, or run among a flock of sheep; and will not, without the utmost difficulty, be taken from among them. Add, that some will take the ground like a coney: this is called going to *scout*.

Some hares will go upon one side of the hedge, and come down the other; and we have known a hare, that, being sorely hunted, has got upon a quicker hedge, and ran a good way on the top thereof, and then leaped off upon the ground; and it is no unusual thing for them to take themselves to fuz-bushes, and leap from one to another, whereby the hounds are frequently in default.

A hare, it is said, does not live above seven years at most, especially the buck; and if he and the doe keep one quarter, they will not suffer any strange hare to fit by them; whence the proverb, "The more you hunt, the more hares you shall have;" lines, having killed one hare, another comes and possesses his form. By this way it is to be observed, that to enter a young kennel of hounds, regard must be had to the nature of the country, and of the quarry: for according to the place wherein they are entered, and the game first given them, will they afterwards prove. Thus if they be entered in a champaign country, they will ever after more delight to hunt there than on any other ground.

Having found where a hare hath relieved in some pasture, or corn-field, to find her form, the season of the year and the state of the weather are to be considered. In the spring, or summer, a hare will not fit in the bushes, because frequently offended with pinnacles, flocks, and adders; but will fit in corn-fields, and open places. In winter they choose to fit near towns and villages, in tufts of thorns and brambles, especially when the wind is northerly or southerly. According to the season, and nature of the place where the hare is accustomed to fit, there beat with your hounds, and flat her; which is better sport than trailing of her from her relief to her form. Having started her, slip in, and halloo in the bounds till they have undertaken it; crying, *that, that, or there, there*, and go on with full cry; then recede them, and follow at a distance, taking care not to forward them too much at first, as being apt, if the first beat, to overthrow the game. Above all things, mind the first doubling the hare makes, which is to be a key or direction for the whole day; all the other doublings the afterwards makes being like the first. According to the policies you see her use, and the place where you hunt, make your compass, to help the default, great or little, long or short; always seeking the most silent and most commodious place for the hounds to scent in.

HUNTING, buck, or HUNTING of red deer. This animal the first year is called a *calf*, or *hind-calf*; the second year, a *knicker*; the third, a *brake*; the fourth, a *faggard*; the fifth, a *stag*; the sixth, a *hart*.

The female is called a *hind*. The first year she is *calf*; the second, a *beast*, and sometimes a *brake's sister*; the third, a *hind*.

Terms occurring more especially in hunting the hart, and not yet explained, are as follow. The print, or impression, where a deer has lain, is called a *layer*: if it be in covert, or a thicket, it is called his *barbar*; where a deer has passed into a thicket, leaving marks whereby his bulk may be guessed at, it is called an *entry*; when they call their heads, they are said to *mew*; when they rub their heads against trees, to bring off the peels of their horns, they are said to *frog*; when a deer hard hunted, takes to swimming in the water, he is said to go to *swim*; when they turn head against the hounds, they are said to *lay*; when the hounds touch the scent, and draw on till they put up the hart, they are said to *draw in the flat*.

As to the nature and qualities of the hart, it is to be observed, that he is an excellent swimmer; there being instances, when he has been hunted, of his plunging in the sea, and being killed by fishermen twelve miles from land. When, in going to rest, they have occasion to cross a great river, or arm of the sea, it is said they assemble in great herds; the strongest goes in first, and the rest of strength follow; and so one after the other, relieving themselves by laying their heads on the buttocks of each other.

The hind commonly carries her calf eight or nine months, which usually falls in May; some have two at once; and they always eat up the skin wherein the calf lay. As the young grow up, the old one teaches it to run and leap, and how to defend itself from the hounds.

The hart is amused at hearing any one call, or whistle,

in his fit: if you cry *more, more, or take heed*, you will see him instantly turn back, and make some little stand. His sense of hearing is very perfect when his head and ears are erect; but very imperfect when he holds them down: hence, when he pricks up his ears, he is known to be apprehensive of danger. When he is on foot, and not afraid, he wenders, and takes a pleasure to gaze at every thing he sees.

The hart is very long lived, commonly reaching to a hundred years, or upwards. The principal marks of his age are taken from his head, yet this is somewhat precarious: some having more wrinkles thereon at the same age than others. Those are accounted to excel in beauty of horns, which bear them high: though solid throughout as stones, yet, if they remain a while in the air, they grow very light and fragile, discovering themselves to be no other than an earthy substance, concrete and hardened with a strong juice into the form of bones.

The horns being fallen, they retire, and hide themselves in the shade, to avoid the annoyance of flies, and only come out to feed in the night. Their new horns appear, at first, like bunches, very soft and tender; but by the increase of the sun's heat, they at length grow harder, and are covered with a tough skin, called a *crust head*. As that skin dries, they daily try the strength of their new heads upon trees, which not only burnishes and scrapes off the roughness, but by the pain they feel hereby, diminishes them how long to forbear the company of their fellows; for when the horns grow insensible, they return to their former condition.

The taking of this beast requires great art and attention. When the hunter goes for sport, he is first to encompass the *beast in one gyle*, in her own lair, and thus unharmed her in the view of the dogs, so they may never lose her foot or footing. But next, a deal of choice and discretion is here required; for he may not set off upon every one, either of the herd, or those which wander solitary: the young, the small, &c. are to be pulled over; and partly by sight, and partly by the footing, fewness, the largeness of the lair, &c. he must make judgment of the game, singling out for that purpose the largest head in the whole herd.

There are divers means for knowing an old hart: viz. by the *fat, the ears, the stature and full, the fumes, gait and walk, fraying-feet* and the *load and brander*.

1. As to the *fat*. The readings of the hart's foot are to be carefully noted: if you find the readings of two, the one long, and the other round, yet equally big, the longest foot declares the largest hart; add, that the old hart's hind-foot never over-reaches the fore-foot, as that of the young ones do. 2. The *sewings* is chiefly to be judged of in April or May: if he is large and thick, it signifies the hart to be old. 3. To know the height and thickness of the hart, observe his entries and galleries into the thickets, and what boughs he hath over-rid-den and mark from whence the height of his belly frays the ground: for a young deer usually creeps low, as he passes to his harbour, and goes through places which the old one, being stiff and flandy, will not stoop to.

4. By his gait it may be known whether the hart be large, and whether he will stand long before the hounds: if he have a long step, he will stand long, being swift, light, and well breathed; if he have a great foot, which is the sign of an old deer, he will be a *laffer*. As to his *fraying-foot*, note, that the older the hart is, the sooner he goes to fray, and the greater is the tree he chooses to fray upon; if being necessary it be such as may not bend. Now, to seek or find out a hart in his haunt, or feeding-place, it is to be observed, that he changes his manner of feeding every month. From the conclusion of the rutting time, which is in November, they feed in heaths and brouny places. In December they herd together, and withdraw into the strength of the forests, to shelter themselves from the severe weather, feeding on holm-trees, elder-trees, brambles, &c. The three following months they leave the herding, but keep four or five in a company, and in the corners of the forest will feed on the winter pasture, sometimes making their excursions into the neighbouring corn-fields, if they can perceive the blades of wheat, rye, &c. appear above ground. In April and May they rest in thickets and shady places, during very little till rutting time, unless disturbed. The three succeeding months they are in their pride of grease, and resort to springs, copes, and corn-fields. In September and October they leave the thickets, and go to rut, during which season, they have no certain place either for food or harbour.

Having found out the game, the hunters discouple and cast off the dogs; and some on horseback, others on foot, follow the cry with the utmost art, observation, and speed, remembering and preventing the subtle turning and headings of the hart, standing with dexterity and intrepidity to leap hedge, pales, ditch, &c.

The utmost address and circumspection are to be used to keep to the best first attempt, and to prevent the dogs from pursuing any other; this, in effect, makes one of the principal difficulties and glories of the chase; the beast having a hundred devices to put off some other head for his own: sometimes he will feed forth some other little deer in his head into the dogs way, laying close the while himself; on which occasion the huntsman is to sound a retreat, and break off the dogs, and take in team, till the game be recovered.

Sometimes he will purposely seek out other deer at layer, and rouse them to make the hounds hunt change, himself lying down flat in some of their layers upon his belly, to make the hounds over-shoot him: add, that they may neither scent nor vent him, he will gather up his fore-feet under his belly, and blow or breathe on some moist place of the ground, so that the hounds shall pass within a yard without apprehending him. He will break into one thicker after another, to find deer, roaring, gathering them together, and herding with them, and even beating some of them into his tracks, that he may the more easily escape. Finding himself spent, he will break herd, and fall to doubling and crossing in some hard beaten highway, always running against the wind, not only to cool himself, but the better to hear the voice of his pursuers.

The last refuge of a hart *forely hunted*, is the foil; keeping the middle, far fear, least by touching a bough, or the like, he may give scent to the hounds. He always swims against the stream; whence the old rule, "He that will his chase first, let him try up the river, and "down the wind." In taking foil he will sometimes cover himself under water, so as to show nothing but his nose.

Where opportunity of water fails, he will fly into herds of cattle, as cows, sheep, &c. and will sometimes leap on an ox, cow, or the like, laying the fore part of his body thereon, that so touching the earth with his hinder legs, he may leave a small or no scent behind. What is farther still, the chief huntsman of Lewis XII. relates, that a hart which they were in hard chase of, leaped into a great tall white thorn, which grew in a meadow place, and there stood aloft till he was run through by a huntsman, rather than he would stir.

The hart being killed, the huntsman with his horn windeeth the fall of the beast; upon which every one approaches: the skillfullest opens the beast, rewarding the hounds with what properly belongs to them; the huntsman, at the same time, dipping bread in the skin and blood of the beast to give the hounds their full satisfaction.

The hart is known to be spent by his running stiff, high, and lampering; by his mouth being black and dry, without foam on it, and his tongue hanging out; though he will sometimes close his mouth to deceive the spectators; and by his flia, for he will sometimes close his claws together, as if he went at leisure, and strain again open them wide, making great gillings, and hitting his dewlaps upon the ground, &c. When quite spent, and close beset, or, intercepted on all sides, the hart usually takes to fly, and makes force with his head against the first man or dog that closes in upon him, unless prevented with a spear, sword, or the like. Hence it is very dangerous going into a hart at bay, especially at rutting time, for then they are more than ordinarily fierce.

The hart being killed, his death is solemnized with great ceremony. The first thing, when the huntsmen come in, is to cry, *Ware harts*; that the hounds may not break in to the deer: having secured this, they cut his throat, and blood the younger hounds, to make them love deer, and learn to leap at his throat; then having bled the moor, and all the company being come in, the most distinguished person, who has not taken *foy* before, takes up the knife, and lays it across the belly of the deer (some of the assistants holding by the fore-legs, and at the same time the huntsman drawing down the pizzle) and thus he draws the knife along the middle of the belly, beginning near the brisket, cutting deep enough, to discover how far he is. Then the most skillful person breaks up the deer, by first splitting the skin from the cuttings of the throat downwards, making the arbor, that the ordure may not break forth, and then paunching him, and rewarding the hounds therewith.

Lastly, the person that took the *foy*, being presented with a drawn hanger, he is to cut off the head, which done, and the hounds rewarded therewith, the concluding ceremony, it is a buck, it is a double; if a stag, a treble moor blown by one, and a *recheat* in concert by all that have horns: the whole is then concluded with a general *whoa whoa*.

HUNTING, *stee*. See OTTER.

The otter is to be hunted by particular dogs, called *stee-hounds*, and also with special instruments, called *stee-spears*. To find him out, some are to go on one side of

the river, and some on the other, braving all the way on the banks, with the dogs following. Thus it is soon found if there be an otter in that quarter; for the otter cannot endure long in the water, but must come forth to make his sprains, and in the night sometimes to feed on grubs, and other berbs. If the hounds find an otter, look in the loft and moist places, to learn by the prints which way he bent his head: if these make no discovery, it may be partly perceived by the sprains. This done, follow the hounds, and lodge him as a hart or deer.

The otter always endeavours to keep to the water, where he is master. In hunting him therefore, you are to be ready with your spears, to watch its veins; for that is the chief advantage: if you perceive where he swims under water, drive to set a stand before him, where you expect he will vent, and then endeavour to strike him with the spear: if you miss, pursue him with the hounds; which, if they be good, and well entered, will come chunting and trailing along the river-side, and beat every tree, root, every ditch-bed, and tuft of bulrushes; nay, sometimes, they will take the water, and beat it like a spaniel; by which means the otter can hardly escape. If the beast find himself wounded with a spear, he usually makes to land, where he will maintain a furious battle with the dogs.

HUNTING, *reindeer*. See ROE-DEER, and ROE-DEER.

We have no roe-deer in England; but they abound in the Highlands of Scotland, Germany, Africa, &c. And it should seem that they have been more common among us, our hunters still retaining the proper terms for the chase.

They make good chase, stand long, and fly end-way. When a roe crosses and doubles, it is called *trapping*. Their swiftness appears not only on the earth, but in water, through which they cut their way as with ears; whence they love lakes and streams, breaking the floods to come at fresh pasture, feeding on rushes, &c.

Horns grow only on the male; being set with six or seven branches not palmed, but branched, yet shorter than fallow deer. After rutting he casts his horns. They are fast never to wink, not even when asleep; for which conceit their blood is by some fanciful people prescribed to persons dim-sighted or purblind. The tail of this beast is less and shorter than that of a fallow-deer, inasmuch that it is questioned whether it ought to have that denomination.

They keep mostly in mountains among the rocks; and when hunted, Martial tells us, will hang thereon with their horns, to delude the dogs. They are often taken by counterfeiting their voice, which the huntsman does by the assistance of a leaf in his mouth.

When hunted, they turn much and often, and will come back on the dogs directly, when they can no longer endure. They also take foil, as the hart; and will sometimes hang by a bough in such a manner, as that nothing shall appear but their snout.

HUNTING match. The first thing that is to be considered by one who designs to match his horse for his own advantage, and his horse's credit, is not to flatter himself with the opinion of his horse, by fancying that he is a swift, when he is but a slow galloper; and that he is a whole running horse (that is, that he will run four miles without a sob at the height of his speed) when he is not able to run two or three. Very probably some gentlemen are led into this error, by their being mistaken in the speed of their horses, who, for want of trying them against other dogs that have been really fleet, have supposed their own to be so, when, in reality, they are but of a middling speed; and because their horse, when trained, was able to follow them all day, and upon any hour, to command them upon deep as well as light earths, have therefore made a false conclusion, that their horse is as swift as the bell; but upon trial against a horse that has been rightly trained after hounds that were truly fleet, have bought their experience perhaps full dear: therefore it is advisable for all lovers of hunting to procure two or three couple of tried hounds, and once or twice a week to follow after them a train-scent, and when he is able to top them on all sorts of earth, and to endure heats and colds fluently, then they may better rely on his speed and toughness.

That horse which is able to perform a hare-chase of five or six miles briskly and courageously, till his body be as it were bathed in sweat; and then, after the hare has been killed, in a snipping frosty morning, can endure to stand till the sweat be frozen on his back, so that he can endure to be pierced with the cold as well as the heat, and then even in that extremity of cold to ride another chase as briskly and with as much courage as he did the former, that horse which can thus endure heats and colds is most valued by sportsmen. Therefore, in order to make a judgment of the goodness of a horse, observe him after

the death of the first hare, if the chase has been in any degree brisk; if when he is cold, he shrinks up his body, and draws his legs up together, it is an infallible sign of want of vigour and courage: the like may be done by the slackening of his girths after the first chase, and from the dulness of his teeth, and the dulness of his countenance, all which are true tokens of faintness, and being tired; and such a horse is not to be relied on, in case of a wager.

Here it will not be improper to take notice of the way of making matches in former times, and the modern way of deciding wagers. The old way of trial was, by running for many train-scents after hounds, as were agreed upon between the parties concerned, and a bell-course, this being found not to be uncertain, but more durable than hare-hunting; and the advantage consisted in having the train laid on earth most suitable to the qualifications of the horses. But now others choose to hunt the hare till fast at an hour, and then to run this wild-goose-chase, a method of racing that takes its name from the manner of the flight of wild geese, which is generally one after another; so the two horses after running of several courses, had liberty, which horsesoever could get the leading, to ride what ground he pleased, the hindmost horse being bound to follow him, within a certain distance agreed on by articles, or else to be whipped up by the trainers or judges, which rode by, and whichever horse could distance the other, won the match.

But this chase was found by experience to be inhuman and so destructive to good horses, especially when two good horses were matched; for neither being able to distance the other, till both were ready to sink under their riders through weakness, that sometimes the match was vain to be drawn, and left undecided, though both the horses were quite spoiled.

This brought up the custom of train-scents, which afterwards was changed to three heats, and a straight course; and that the lovers of horses might be encouraged to keep good ones, plates have been erected in many places of England. The favour of these before you come to the course, if your horse be fiery and mettled, the better, and the shorter the distance the better. Also, above all things, be sure to make your bargain to have the leading of the first train, and then make choice of such grounds where your horse may best show his speed, and the best of dogs you can procure: give your bounds as much law before you as your triers will allow, and then, making a loose, try to win the match with a wind, but if you fail in this attempt, then beat your horse, and save him for the course; but if your horse be slow, but well winded, and a true spurred nag, then the more train-scents you run before you come to the straight course, the better. But here you ought to observe to gain the leading of the first train; which in this case you must lead upon such deep earths, that it may not end near any light ground; for this is the rule received among horsemen, that the next train is to begin where the last ends, and the last train is to be ended at the starting-place of the course; therefore remember to end your last on deep earths, as well as the first.

HUNTING *salts*. See SANDLES.

HURA, in *Botany*. See SAND BOX-tree.

HURDLE is the name of the sledge used to draw traitors to the place of execution.

HURDLES, in *Fortification*, twigs of willows or osiers, interwoven close together, in the form of a large square, five or six feet long, and three or three and a half broad, sustained by strong stakes, and usually laden with earth.

Hurdles, called also *craters*, serve to render batteries firm, to consolidate the passage over muddy ditches, and cover traverses, and lodgements for the defence of the workmen against the artificial fires or stones that may be cast upon them.

HURDLES, in *Hydromechanics*, are frames made either of split timber or of hazel-rod, platted together, to serve for gates in inclosures, to make sheepfolds, &c.

HURDS, or **HARDS** of *flax* or *hemp*, the coarsest parts, separated in the dressings from the neat or fine stuff. See **HEMP** and **FLAX**.

HURENHUTTERS, in *Ecclésiast. History*. See **HARENHUTTERS**.

HURLE bone, in a horse, is a bone near the middle of the hock; very apt to go out of its socket with a slip or strain.

HURLERS, a number of large stones, set in a kind of square figure near St. Clare, in Cornwall, so called from an odd opinion held by the common people, that they are for many men petrified, or changed into stones, for profaning the sabbath-day by *hurling* the ball, an exercise for which the people of that country have been always famous.

The *hurlers* are oblong, rude, and unhewn. Many authors

thors suppose them to have been trophies erected in memory of some battle; others take them for boundaries to distinguish lands. Lastly, others, with more probability, hold them to have been sepulchral monuments.

HURLY-BURLY, in *Vulgar Language*, denotes confusion or tumult, and is said to owe its origin to two neighbouring families, Hurleigh and Burlleigh, which filled their part of the kingdom with content and violence. Johnson.

HURRERS, in our *Old Writers*. The cappers and hat-makers of London, formerly one company of the hatter-dalshers, were called by this name.

HURRICANE, a furious form of wind, rain, thunder, and lightning, attended with a great swelling of the sea, and sometimes with an earthquake; and, in short, with every circumstance which the elements can assemble that is terrible and destructive.

Hurricanes are frequent in the East and West Indies, making terrible ravages in the islands thereof; blowing down houses, rooting up trees, and even whole woods; making caverns in the earth, and scattering earth, bricks, stones, timber, &c. to a great distance, in every direction. Great quantities of water have been left, or raised by them, so as to make a kind of deluge; and they have been always attended with a prodigious rumbling noise. As a prelude to the ensuing havoc, whole fields of sugarcanes are seen whirled into the air, and scattered over the face of the country; the strongest trees of the forest are torn up by the roots, and driven about like stubble; their wind-mills are swept away in a moment; their works, their fixtures, the ponderous copper boilers and stills, of several hundred weight, are wrenched from the ground, and battered to pieces; the roofs of their houses are torn off at one blow, whilst the rain, which in an hour rises six feet, rushes in upon them with an irrepressible violence.

They usually begin in the north, some say the west, but turn round; and in a little time veer through all points of the compass.

Great mischiefs are done to our vessels about the Caribbee islands, and elsewhere, by means of the *hurricanes*, and at the time of year when they are most frequent, which is in the midst of summer, principally in the month of August, more rarely in July and September.

It is the custom for the French and English inhabitants in the Caribbee islands, to send every year about June to the native Caribbees of St. Domingo and St. Vincent, to know whether there will be any *hurricanes* that year; and about ten or twelve days before any *hurricanes* come, they constantly find them word.

The prognostics those people go by, are given us by captain Langford, who, in 1767, engaged one of them, by civilities, to reveal them to him.

It is one of their principles, that all *hurricanes* come either on the day of the full, or of the change, or quarter of the moon; each of which is discovered by a number of phenomena in the preceding quarters, as a turbulent sky, sun red, universal calm, the stars appearing red, larger than usual, and surrounded with a sort of horns, noises in hollows or cavities of the earth, strong swell of the sea, which rises into large waves, a settled westerly wind, blowing, with intermissions, violently and irregularly, for about two hours at a time; and at the full of the moon, the moon itself is surrounded with a great bur, and sometimes the sun has the same appearance. That author assures us, he received this benefit from the information, that whereas *hurricanes* are so dreadful, that all ships are afraid to put out to sea while they last, and choose rather to perish at anchor in the roads, yet, with good management, he found, that a vessel may lie out at sea, in these, as safely as in other storms, by taking care the ports are well barred and calked, the top-masts and tops taken down, the yards a-port laid, and the doors and windows secured. With these precautions that experienced navigators preferred his vessel in two great *hurricanes*, and taught others how to do the same, by putting out from port, where they would inevitably have perished. And from the prognostics above, he foretold several *hurricanes* at land.

He adds, that all *hurricanes* begin from the north, and turn to the westward, till arriving at the south-east, their force is spent.

The cause he suggests to be the sun's leaving the zenith of those places, and going back towards the south; and the repelling or bounding back of the wind, occasioned by the calming of the general trade-wind. Phil. Trans. N° 245.

It is observable, that the air is much colder during these *hurricanes* than at other times; but Ligon, and some others, fond of relating strange stories, make it much more than it really is, the sailors who have been in these storms declaring that they have felt no such chilliness as those authors relate. The wind during the *hurricane* is so strong, and varies so fast between the north

and the north-east point, that it is impossible for any ship to answer the veerings of it; it is hence that all the art of the sailors often cannot prevent the backs of the vessels from being broken, and the masts being carried by the board. The main-mast of a ship of four hundred ton will be in an instant wreathed like a willow, and borne by the board before they can hand a sail. Phil. Trans. N° 36.

Switzerland is subject to very violent *hurricanes*, which do great mischief, and that in a very singular manner. Thunder and lightning are frequent with them in winter as well as in summer; and the more violent storms of these, are sometimes attended with whirlwinds and *hurricanes*, which will raise the water of some lakes in form of a thick pillar up to the clouds, and carrying on before the wind this vast body of water, will sometimes fall in other places on dry land, and drown the houses and gardens where it chanceth to fall. These are all phenomena of electrical origin, and depend on the same general causes. See ELECTRICITY, LIGHTNING, and SPURT.

HURST, or **HYRST**, in our *Old Writers*, denotes a wood or grove of trees. Hence such places as have this word for part of their names, have been situated near a wood. In Kent, Sussex, and Hampshire, there are many fuch, because formerly the great wood called Andredswald, extended itself through these counties.

HURTER, in *Antiquary*, a flatted iron fixed against the body of an axle-tree, with straps, to take off the friction of the naves of wheels against the body.

HURTERS, in *Perfianity*, denote pieces of timber about six inches square, placed at the lower end of the PLAT-FORM, next to the parapet, to prevent the wheels of the gun-carriages from damaging the parapet.

HURTS, in *Herabry*, by some wrote *HURTS*, and by others *HURTS*, are azure or blue runlets.

The English heralds distinguish between the colours of runlets, and give them different names agreeable thereto; those of other nations content themselves to call these *runlets d'azur*; and in other cases only add the respective colour to the term *runlet*.

But these being blue, some will have them to signify bruises or contusions in the flesh, which often turn to that colour; others suppose them whorled berries.

HUSBAND, *Maritus*, a man joined, or contracted with a woman in MARRIAGE.

By the laws of England, the wife is supposed wholly under the dominion of her husband, nor can act or will any thing of herself. See WIFE. See also COVERTURE, DIVORCE, DOWRY, FEME COERT, &c.

In Germany, the power of the husband is not so extensive; even the princes of the empire have not a sovereign and despotic power over their wives and children.

HUSBAND-LAND, a term used in Scotland for a portion of land containing six acres of fock and scythe land; that is, of land that may be tilled with a plough, and mown with a scythe.

HUSBANDRY denotes the same with AGRICULTURE.

The reader will find an account of the principal operations, implements, and produce of husbandry, arranged under their proper heads, in the course of this work.

The new method of husbandry, called by Till the *husbanding* husbandry, has many evident advantages over the other, or old way, called the *brood-cow*, but the difference between them is best explained by a fair comparison. In order to do this justly, there are four things to be carefully considered. 1. The expense of a crop. 2. The goodness of the crop. 3. The certainty of it. And, 4. The condition in which the land is left after the crop.

The profit or loss arising from land, is not to be computed only upon the value of the crop it produces, but from its value after all expenses of seed, tillage, &c. are deducted. Thus when an acre of land produces a crop worth four pounds, and the expenses of it amount to five pounds, the loss of the farmer is one pound upon it; whereas, when as much land produces a crop only of the value of thirty shillings, and the expenses are only ten shillings, the owner receives one pound advantage. The common expense of an acre of sowed wheat, in the usual way, is four pound ten shillings, and the common expense of an acre of wheat, in the horse-hoeing husbandry, is only ten shillings, including all the expenses that can attend it. Thus, the charge of this method of husbandry is but a ninth part of that of the common way; and as the crop are required, as there are in the other way, the less flock will do to begin with. The goodness of a crop consists in the quality of it as well as in the quantity, and wheat being the most useful of all grain, a crop of this is more valuable than a crop of any other corn. Add to this, that a crop of hood wheat has always larger ears, and a fuller body, than a crop when sown in the common way. More wheat may also be obtained this way than any other,

other, because the same land will thus produce crops every year; and even the land which has been exhausted by the common husbandry, will produce wheat in plenty this way, without fallowing or dunging, both which would otherwise be necessary; so that, in many places, this husbandry can raise ten acres of wheat for one that the old way could produce, because where land is poor, they grow but a tenth part of it in wheat.

The largest produce of an acre of wheat-land, so far as has yet been experienced, seems to be ten quarters, or eighty bushels to an acre. This is less indeed than the produce of an acre in the common way, according to Houghton's computation; but to compare the different profits to the farmer, we proceed thus: the rent and expenses of a drilled acre being one pound, and that of a sowed acre in the common way being five pounds, one quarter of corn produced by the drilled, bears an equal proportion in profit to one pound, as five quarters produced in the common way do to five pounds. At supposition it to be of wheat at two shillings and six pence a bushel, there is neither gain nor loss in the one nor the other acre, though the drilled produce only one quarter, and the other five quarters. But if the drilled acre yield two quarters, and the sown acre yield only four quarters at the same price, the drilled acre brings the farmer one pound profit, while the other has one pound loss. Likewise suppose the drilling farmer to have his five pounds laid out in five acres of wheat, and the other to have his five pounds laid out in one sowed acre, then let the price be what it will for the wheat, if the five acres have an equal crop to the one acre, the gain and loss must be equal. But if the price of wheat be at two shillings and six pence, the farmer in the common way, if he has five quarters on his acre, must sell it all to pay his rent and expenses; whereas if he who drills the land have five quarters on each acre, the produce of one acre will pay for all five. Or suppose a drilled acre to produce no more than one third of the sown acre, which is raising it very low indeed; the expense of the sown acre being five times as much as that of the drilled one, it is much more profitable to the owner to have the drilled acre, because a third part of five pence is one pound thirteen and four pence, and a fifth of the rent and expense, which is all his charge, being only one pound; such a drilled acre brings the owner thirteen and four-pence profit more than the sown acre, though that brings three times as great a crop.

We shall here subjoin a comparative view of the old and new method of culture, furnished for the editors of Mr. Tull's *Horse-hoeing Husbandry*, by a gentleman, who for some years practised both in a country, where the soil was light and chalky, like that from which he drew his observations. It is necessary to remark, that in the new husbandry every article is rated at its full value, and the crop of each year is four bushels short of the other; though, in several years experience, it has equalled and generally exceeded those of the neighbourhood in the old way.

An estimate of the expense and profit of ten acres of land in twenty years.

I. In the old way.

First year, for wheat, costs	l. s. d.	l. s. d.
33 <i>l.</i> 5 <i>s.</i> viz.		
First plowing, at 6 <i>s.</i> per acre	3 0 0	
Second and third ditto, at 8 <i>s.</i> per acre	4 0 0	
Manure, 30 <i>s.</i> per acre	15 0 0	
Two harrowings, and sowing, at 2 <i>s.</i> 6 <i>d.</i> per acre	1 5 0	
Seed, three bushels per acre, at 4 <i>s.</i> per bushel	6 0 0	
Weeding, at 2 <i>s.</i> per acre	1 0 0	
Reaping, binding, and carrying, at 6 <i>s.</i> per acre	3 0 0	
Second year, for barley, costs 11 <i>l.</i> 6 <i>s.</i> 8 <i>d.</i> viz.		
Once plowing, at 6 <i>s.</i> per acre	3 0 0	
Harrowing and sowing, at 1 <i>l.</i> 6 <i>d.</i> per acre	0 15 0	
Weeding, at 1 <i>s.</i> per acre	0 10 0	
Seed, four bushels per acre, at 2 <i>s.</i> per bushel	4 0 0	
Cutting, raking, and carrying, at 3 <i>s.</i> 7 <i>d.</i> per acre	1 11 8	
Grass-seeds, at 3 <i>s.</i> per acre	1 10 0	
		11 6 8

Third and fourth years, lying in grass, cost nothing: so that the expense of ten acres in four years comes to 44 <i>l.</i>	22 18 4
11 <i>l.</i> 8 <i>s.</i> and in twenty years to	
First year's produce is half a load of wheat per acre, at 7 <i>s.</i>	35 0 0
Second year's produce is two quarters of barley per acre, at 1 <i>l.</i>	20 0 0
Third and fourth year's grass is valued at 1 <i>l.</i> 10 <i>s.</i> per acre	15 0 0
So that the produce of ten acres in four years is	70 0 0
And in twenty years it will be	350 0 0
Deduct the expense, and there remains clear profit on ten acres in twenty years by the old way	127 1 8

II. In the new way.

First year's extraordinary expense is, for plowing and manuring the land, the same as in old way	22 0 0
Plowing once more, at 4 <i>s.</i> per acre	2 0 0
Seed, nine gallons per acre, at 4 <i>s.</i> per bushel	3 5 0
Drilling, at 7 <i>d.</i> per acre	0 5 10
Hand-hoeing and weeding, at 2 <i>s.</i> 6 <i>d.</i> per acre	1 5 0
Horse-hoeing six times, at 10 <i>s.</i> per acre	5 0 0
Reaping, binding, and carrying, at 6 <i>s.</i> per acre	3 0 0
The standing annual charge on ten acres is	13 15 10
Therefore the expense on ten acres in twenty years is	275 16 8
Add the extraordinaries of the first year, and the sum is	297 16 8
The yearly produce is at least two quarters of wheat per acre, at 1 <i>l.</i> 8 <i>s.</i> per quarter, which, on ten acres in twenty years, amounts to	560 0 0
Therefore, all things paid, there remains clear profit on ten acres in twenty years by the new way	262 3 4

So that the profit of ten acres of land in twenty years, in the new way, exceeds that in the old by 13*l.* 1*s.* 8*d.* and consequently is considerably more than double thereof; an ample encouragement to practise a scheme, whereby so great advantage will arise from so small a quantity of land, in the compass of a twenty-one years lease; one year being allowed, both in the old and new way, for preparing the ground.

It ought withal to be observed, that Mr. Tull's husbandry requires no manure at all, though we have here, to prevent objections, allowed the charge thereof for the first year; and moreover, that though the crop of wheat from the drill-plough is here put only at two quarters on an acre, yet Mr. Tull himself, by actual experiment and measure, found the produce of this drilled wheat-crop amounted to almost four quarters on an acre.

It appears also from a comparative calculation of expense and profit between the drill and common husbandry, taken from Mr. Baker's report to the Dublin Society of his experiments in agriculture for the year 1765, that there is a clear profit arising upon an Irish acre of land in fifteen years in the drill husbandry of 52*l.* 3*s.* 11*d.* and in the common husbandry of 27*l.* 10*s.* 2*d.* and therefore a greater profit in the drilled acre in this time of 24*l.* 4*s.* 9*d.* which amounts to 1*l.* 12*s.* 3*d.* per annum. From hence he infers, that in every fifteen years the fee-simple of all the tillage-lands of the kingdom is lost to the community by the common course of tillage. In stating the accounts, for which their rule is obtained, no notice is taken of fences, water-cutting the land, weeding and reaping, because these articles depend on a variety of circumstances, and will, in general, exceed in the common husbandry those incurred by the other.

Besides, the certainty of a crop is greater in this new way than in the old way of sowing; for most of the accidents attending wheat crops, are owing to their being late sown, which is necessary to the farmer in the old way; but in the horse-hoeing method the farmer may plough two furrows whereon the next crop is to stand, immediately after the first crop is off. In this manner of husbandry the land may be ploughed dry and drilled wet, without any inconvenience; and the seed is never planted under the furrow, but placed just at the depth which is most

most proper, this is, at about two inches, in which case it is easy to preserve it, and there is no danger of burying it. Thus the feed has all the advantage of early sowing, and none of the disadvantages that may attend it in the other way; and the crop is much more certain than by any other means that can be used.

The condition in which the land is left after the crop, is no less in favour of the horse-hoeing husbandry, than all the other advantages. The number of plants is the great principle of the exhausting of land. In the common husbandry, the number is vastly greater than in the drilling way, and three plants in four often come to nothing, after having exhausted the ground as much as profitable plants; and the weeds which live to the time of harvest in the common way, exhaust the land no less than so many plants of corn, often much more.

The horse-hoeing method destroys all the weeds in the far greater part of the land, and leaves that part unexhausted and perfectly fresh for another crop. The wheat plants being also but a third part of the number at the amount of their sowing, the land is so much the less exhausted by them, and it is very evident from the whole that it must be, as experience proves that it is, left in a much better condition after this than after the common husbandry.

The farmers who are against this method object, that it makes the plants too strong, and that they are more liable to the attacks or blights of insects, for that reason; but as this shows that the hoeing can, without the use of dung, give too much nourishment, it is very plain that it can give enough; and it is the farmer's fault if he do not proportion his manure so as to have the advantage of the nourishment without the disadvantages. It is also objected, that as hoeing can make poor land rich enough to bear good crops of wheat, it may make good land too rich for it. But if this should happen, the sowing of wheat on it may be left alone awhile, and in the place of it the farmer may have a crop of turneps, carrots, cabbages, and the like, which are excellent food for cattle, and cannot be ever over-nourished; or, if this is not chosen, the land, when thus made too rich, may soon be sufficiently impoverished by sowing corn upon it in the common old way. TULL'S HUSBANDRY, Preface, and chap. xvi. See HORSE.

The method of horse-hoeing husbandry, so strongly recommended by Mr. Tull, is objected to by many, on account of the largeness of the intervals which are to be left between the rows of corn. These are required to be about five feet wide; and it is thought that such wide-spaces are so much lost earth, and that the crop is to be so much the less for it. But it is to be observed, that the rows of corn separated by these intervals, need not be single; they may be double, triple, or quadruple, at the pleasure of the farmer; and four rows thus standing as one will have the five foot interval but one fourth of its bigness as to the whole quantity, and it will be but as fifteen-inch intervals to plants in single rows. Corn that is sown irregularly in the common way, seems indeed to cover the ground better than that in rows; but this is a mere *deceptive* reason, for the stalks of corn are never so thick as when they come out of one plant, or as when they stand in a row, and a horse-hoeed plant of corn will have twenty or thirty stalks in a piece of ground of the same quantity, where an unhoeed plant will have only two or three stalks. If the stalks of the hoeed plant were separated and clovered over the intervals, the whole land would be better covered than it is in the common way; and the truth is, that though these hoeed fields seem to contain a much less crop than the common sown fields, yet they in reality do contain a much greater. It is only the different plowing that makes the sown crop seem the larger, and even this is only while both crops are young. The intervals are not left ground, as is usually supposed, but when well horse-hoeed they are all employed in the nourishment of the crop, the roots of the plants in the adjoining rows spreading themselves through the whole interval, and drawing such nourishment from it, that they increase accordingly. When the plants stand in the scattered way, as in common sowing, they are too close to one another; each is in the neighbourhood of part of their nourishment, and consequently the earth is soon exhausted, and all the plants half-starved. The close standing of them also prevents the benefit of after-tilling, as the hoe cannot be brought in, nor the ground by any means fluted between them to give it a new breaking, and consequently afford them new food.

Experiments have abundantly proved, that in large grounds of wheat where the different methods have been tried, those parts where the intervals were largest have produced the greatest crops, and those where hoeing was used without dung have been much richer than those where dung was used without hoeing. If it were possible that plants could stand as thick, and thrive as well over

the whole surface of the ground, as they do in the rows separated by these large intervals, the crops of corn so produced would be vastly greater than any that have been heard of; but the truth is, that plants receive their growth not according to the ground they stand on, but to the ground they can extend their roots into; and therefore a single row may contain more plants than a large interval can nourish, and therefore the same number that stand in that row, and no more than these, could be nourished, if scattered over the whole interval; and they would be much more nourished in that way, because while the interval is void, the earth may be stirred about them, and new roots will be formed in great numbers from every one broken by the instruments, and new nourishment laid before their roots by the breaking the particles of earth, by which the plants will have supplies that they cannot have when scattered over the whole surface, because the ground is then all occupied, and cannot be moved between the plants.

The horse-hoeing which takes place in these large intervals, is to be repeated several times; once or twice hoeing is of great advantage, but the second is repeated the better the crop will succeed. In the beginning, or while the plants are young, it is to be done only in the middle of the interval, that the roots of the regular plants may not be injured by coming too near them; but in the grown plants the hoe may be brought very near their roots without any fear of harm from it; and though the larger roots are many of them broken off by it, they are so soon supplied with new ones, that so in consequence was ever known to attend it. Four land, though it be ever so light, should have many hoeings; for the plants receive but little nourishment from its natural posture, and it is therefore necessary to make a continual supply of the artificial. The young roots multiplied by the scattering of the old ones with the hoe, are looser of lateral months for receiving of nourishment, than the old ones; and it is therefore no wonder, that the latter thrive as propagated the better the plant thrives. And there is a disadvantage in the plants of corn sown in the common way, which is, that their stalks being as numerous, or nearly so at first as afterwards, they very quickly exhaust the ground, whilst the plants in rows with intervals between have much fewer stalks at first, and only increase in number as their roots are increased by the sowing, and the nourishment increased also by the same operation. The earth about the sown plants in the common way soon hardens and shuts out the benefit of the atmosphere, whereas in the other way the hoe keeps it soft and open, ready to receive all the benefits of rains and dews; and though the crop of corn from the hoeed interval way should be twice as large as the other, the land is yet twice as rich for the next crop.

It is impossible to bring these calculations to mathematical rules; but it is very certain that a sown crop succeeding a large undugged hoeed crop, is much better than a sown crop that succeeds a small winged sown crop; and experience shews, that poor worn-out heavy-ground will produce four successful good hoeed crops, the latter all better and better, till the whole is become at length good ground by the benefit of the hoeing, in spite of the nourishment drained out by the potatoes.

The wide intervals are, the more the earth may be divided, for the row takes up the same room with a wide or a narrow interval; and therefore with the wide the unhoeed part bears a less proportion to the hoeed part than in the narrow.

There are many ways of hoeing with the hoe-plough, but there is not room to turn two deep and clean furrows in an interval that is narrower than four feet eight inches; for if it want much of this breadth, one at least of these furrows will trench and fall upon the next row, which will be very injurious to the plants, except of grown farm-fores or some other such plants, which can bear to have the earth pulled over them with a harrow.

All soils and all situations are not equally proper for this method of planting in rows, with large intervals and hoeing between. The lightest soils seem to be best for it, and the tough and wet clays the worst.

Such grounds as lie on the sides of hills are also left proper than others for this work.

This method is not so proper in common fields, but that not in respect of the soil, but of the husbandry of the owners, who are usually in the old way, and change the species of corn, and make it necessary to follow every second, third, or fourth year. Tull, ubi supra, chap. vi. Nevertheless it has been found by later experiments, that the intervals between the rows of plants, as recommended by Mr. Tull, were too great, perhaps double of what they should be in the most profitable method of culture; by which means much less crops are obtained than might be produced at nearly the same expense. This has rendered the profits of the drill method much less than they would

would have been in a more judicious practice, and, consequently, has proved a great advantage to it in comparison with the broad-cast. Mr. Tall was led into this, partly from the want of more perfect instruments for hoeing, and of ploughs proper for drilling. *Bullie's Memo. of Agriculture*, vol. 1, p. 75.

HUSBANDRY, *read-cult.* See **AGRICULTURE**.

HUSBANDRY, *Virgiliana*, a term used by authors to express that sort of husbandry, the precepts of which are to be beautifully delivered in Virgil's *Georgics*. The husbandry in England is Virgilian in general, as is seen by the method of paring and burning the surface, of sowing or cross-plowing, and of the care of destroying weeds upon the same principle, and by much the same means. In those parts of England along the southern coast, where the Romans principally resided, not only the practice, but the expressions are in many respects the same with those of the ancient Romans, many of the terms used by the plowman being of Latin origin, and the terms with those used by those people on the like occasions. And on a strict observation, more of Virgil's husbandry is at this time practised in England than in Italy itself. This change in the Italian husbandry, however, much more to the credit of that people, than the retaining the Virgilian science to ours.

Tall, who has established a new method of husbandry, observes, that it is upon the whole, to be contradictory to this old plan, that it may be called the *anti-Virgilian husbandry*; and adds, that no practice can be worse than the Virgilian.

HUSERECE, in our *Old Writers*, an offence now called **BURGLARY**.

The word is Saxon, from *hus*, a house, and *erece*, a breaking. Bloom, in *loc.*

HUSCANS, in our *Old Writers, a sort of boot or buskin made of coarse cloth, and worn over the stockings. We find them mentioned in the stat. 4 Edw. IV. cap. 7.*

HUSGABLE, *Halsgabun*, in our *Old Writers, denotes house-rent, or some tax or tribute laid upon houses.*

HUSK, among *Botanists*, the part which the flower grows out of.

Of these there are several kinds; as *calyx*, or round *calyx*, *hute calyx*, *middle calyx*, *sea calyx*, *leaf calyx*, &c. See **CALYX**.

The *huts* or cups of the flowers of plants are not so much regarded with a view to their medicinal virtues as they deserve. Peiser, in the *Philosophical Transactions*, speaking of the virtues of the varicillate class of plants, among which are included the fig, tamarisk, and the like, observes that it is an erroneous, though general opinion, that the flowers of these plants contain their principal virtues; for that the *huts* are the part in which this matter is lodged. For instance, in the *rosemary*, the fine scent of the *HYSSOPUS* is not in the flowers, but *huts*; and the flowers, along which clean picked from them, yield very little odour. The cup, in this and other plants of the same class, is the only part in which their vicious and sulphurous qualities are lodged, and that something of this kind is deposited particularly there, may be perceived by the touch and smell; for they appear moist, and feel clammy; and this clammy matter, when received upon the fingers, is of a very strong and agreeable smell, much more so than the rest of the plant.

HUSK denotes a disease of young bullocks. See **COWRY**.

HUSO *Gomphus*, in *Ichthyology*, the name of a large fish of the *STURGEON* or *ACIPENSER* kind, without tubercles, caught in the Danube, Bosphorus, and other large rivers, and passing at times into the sea. It has a very long snout, and under it either four or eight beards; it has one back-fin, which is placed near the tail, and two pair under the belly; its general shape somewhat resembles that of the pike, and its back is black, and its belly yellow; it has thirteen dorsal and forty-three caudal scales, and has cartilages instead of bones. It is caught in October and November, and in some places till January; and great numbers of them are usually brought to market together in those months in the countries where they are caught. They always swim in shoals. It grows to twenty-four feet long, and weighs one, two, three, or even four hundred pounds. The drug called *TRUCELLARY*, and the food called *CAVEAR*, are prepared from this fish. See *Tak. II. Fish*, N. 14. Ray's *Ichthyographia*, p. 243.

HUSARIA, **HUSARIES**, or **HUSARIS**, an order or species of soldiery in Poland and Hungary, commonly opposed to the Ottoman cavalry.

The *husars* are horsemen, whose uniform is a large fur-trimmed cap, adorned with a cock's feather: those of the officers with an eagle's or heron's; a very short waistcoat, with breeches and stockings in one piece; short light boots; and a doublet, having five rows of buttons, which hang loosely on the left shoulder. Their arms are a long crooked sabre, light carbines, and pistols. Before

they begin an attack, they lay themselves flat on the necks of their horses; but being come within pistol shot of the enemy, they raise themselves up with such quickness, and fall on with such sterminy, that it is very difficult for the troops they oppose to preserve their order. In a retreat no other cavalry can pretend to follow them; as they leap over ditches, and swim through rivers with a surprising facility. Most of the princes on the continent have troops under this name.

HUSSITES, in *English Real History*, a party of reformers, the followers of John Hus.

John Hus, from whom the *Hussites* take their name, was born in a little village in Bohemia, called Hus, and lived at Prague in the highest reputation, both on account of the sanctity of his manners, and the purity of his doctrine. He was distinguished by his uncommon erudition and eloquence, and performed, at the same time, the functions of professor of divinity in the university, and of ordinary pastor in the church of that city. He adopted the tenets of Wickliffe, and the Waldenses; and in the year 1407 began openly to oppose and preach against divers errors in doctrine, as well as corruptions in point of discipline, then reigning in the church. Hus likewise endeavoured to the utmost of his power to withdraw the university of Prague from the jurisdiction of Gregory XII. when the kingdom of Bohemia had hitherto acknowledged as the true and lawful head of the church. This occasioned a violent quarrel between the incensed archbishop of Prague, and the zealous reformer, which the latter inflamed and augmented, from day to day, by his pathetic exclamations against the court of Rome, and the corruptions that prevailed among the sacerdotal orders.

There were other circumstances that contributed to inflame the resentment of the clergy against him. He adopted the philosophical opinions of the *ARABISTS*, and vehemently opposed and even persecuted the *SCHOLASTICS*, whose number and influence were considerable in the university of Prague. He also multiplied the number of his enemies in the year 1408, by procuring, through his great credit, a sentence in favour of the Bohemians, who disputed with the Germans concerning the number of suffrages which their respective nations were entitled to in all matters that were carried by election in this university. In consequence of a decree, obtained in favour of the former, which restored them to their constitutional right of three suffrages, usurped by the latter, the Germans withdrew from Prague, and in the year 1409, founded a new academy at Leipsick. This event no sooner happened, than Hus began to inveigh with greater freedom than he had before, against the vices and corruptions of the clergy, and to recommend, in a public manner, the writings and opinions of Wickliffe, as far as they related to the papal hierarchy, the deposition of the court of Rome, and the corruption of the clergy. Hence an accusation was brought against him, in the year 1410, before the tribunal of John XXIII. by whom he was solemnly expelled from the communion of the church. Notwithstanding this sentence of excommunication, he proceeded to expose the Romish church with a fortitude and zeal, that were almost universally applauded.

This eminent man, whose piety was equally sincere and fervent, though his zeal was perhaps too violent, and his prudence not always circumspect, was summoned to appear before the council of Constance. Secured, as he apprehended, from the rage of his enemies by the safe-conduct granted him by the emperor Sigismund, for his journey to Constance, his residence in that place and his return to his own country, John Hus obeyed the order of the council, and appeared before it, to demonstrate his innocence, and to prove that the charge of his having defamed the church of Rome was entirely groundless. However, his enemies so far prevailed, that by the most scandalous misrep of public faith, he was cast into prison, declared a heretic, because he refused to plead guilty against the dictates of his conscience, in obedience to the council, and burnt alive in 1415; a punishment which he endured with unparalleled magnanimity and resignation.

The same unhappy fate was borne by Jerome of Prague, his intimate companion, who attended the council, in order to support his persecuted friend. Jerome, indeed, was terrified into temporary submission; but he afterwards resumed his fortitude, and maintained the opinions, which he had for a while deserted through fear, in the flames, in which he expired in 1416.

The disciples of Hus adhered to their master's doctrine after his death, with a zeal which broke out into an open war, that was carried on with the most savage and unparalleled barbarity. John Zizka, a Bohemian knight, in 1420, put himself at the head of the *Hussites*, who were now become a very considerable party, and threw

off the despotic yoke of Sigismund, who had treated the brethren in the most barbarous manner. Zilkus was succeeded by Procopius, in the year 1524. The acts of barbarity that were committed on both sides were shocking and horrible beyond expression: for, notwithstanding the irreconcilable opposition between the religious sentiments of the contending parties, they both agreed in this one horrible principle, that it was innocent and lawful to persecute and exterminate with fire and sword the enemies of the true religion; and such they reciprocally appeared to each other. These enormities in a great measure subsided by the interference of the council of Basil, in the year 1532.

The *Hellens*, who were divided into two parties, viz. the *Calixtinians* and *Lazarists*, spread over all Bohemia and Hungary, and even Silesia and Poland; and there are some remains of them still subsisting in all those parts. *Mishkin's* *Eccl. Hist.* vol. iii. p. 227, &c. 266, *See* *Engl. ed.* 1768.

HUSTINGS. See *COVER* of *hustings*.

HUT, or HUTT, from the Saxon *hute*, a small cottage or house.

The word is also used for the soldiers' lodges in the field otherwise called *SARRACKS*, or *CAVENS*.

HUTCH, among *Farmers*, denotes a rellid or particular place in which to lay corn; also a kind of hollow trap for the taking of weasels, or other vermin, alive; and it also signifies a sort of cage, formed of boughs and slips of wood, opening in front, and divided within, for keeping and breeding rabbits.

HUTCHINSONIANS, in *Eschological History*, a kind of chalcididæ foot, that spring up in this country towards the beginning of this century, and that derived its name from John Hutchinson, who was born in Yorkshire, A.D. 1674. Having been educated in his father's house with a view to the office of steward to some gentleman or nobleman, he was advanced at an early period of life to this station in the service of the duke of Somerset; and his business calling him to London about the year 1700, he became acquainted with Dr. Woodward, who employed him in making that large and noble collection of fossils. *See* which the duke bequeathed to the university of Cambridge. Mr. Hutchinson, being desirous of prosecuting his literary studies, begged leave to quit the service of the duke, who appointed him his riding-parson, with a fixed salary of 200*l.* per annum; and this place he enjoyed till his death in 1727. In 1724 he published the first part of his *Moses's Principia*, in which he ridiculed Dr. Woodward's *Natural History of the Earth*, and his account of the settlement of the several fluids, fluids, and nodules, by the law of gravity; and from this time to his death he continued publishing a volume every year, or every other year; which, with the manuscripts left behind, were published in 1748, in twelve volumes octavo; an abridgement of his works was also published in 1752. In 1712 Mr. Hutchinson completed a machine of the watch kind for the discovery of the longitude at sea, which is said to have been so contrived, that the spring, wheels, and pivot, &c. were not in any considerable degree influenced by heat, cold, moisture, and drought, and to be capable of that degree of exactness which is requisite for the purpose. In 1727 he published the second part of *Moses's Principia*, containing the principles, or the apophthegms, of the Scripture philosophy; which are, a pyramid, and the air. The air he supposes to exist in three conditions, viz. fire, light, and spirit; the two latter are the finer and grosser parts of the air in motion; from the earth to the sun, the air is finer and finer, till it becomes pure light near the confines of the sun, and becomes in the orb of the sun, or solar focus. From the earth, towards the circumference of this system, in which he includes the fixed stars, the air becomes grosser and grosser, till it becomes torpid and stagnant, in which condition it is at the utmost verge of this system; from whence he says, the expulsion of "outer darkness, and blackness of darkness," used in the New Testament, seems to be taken. The sun, which he places in the centre, is the active vivifying agent, which, by melting the spirit or grosser parts of the air into atoms or finer parts, or ether, sets the machine forward, and keeps it a going; for the light is pressed out by the influx of spirit, and the spirit is pressed in by the efflux of light; and thus the whole matter of the heavens or air is perpetually changing conditions, and circulating. In the introduction to his work, Mr. Hutchinson suggested, that the idea of the Trinity was to be taken from the three grand agents in the system of nature, fire, light, and spirit; which are three conditions of one and the same substance, and wonderfully answer in a typical or symbolical manner to the three persons of one and the same essence. He also discovered this doctrine in the term *cherubim*, which he derives from *כרוב* *cherub*, denoting *similitude*, or *resemblance*, and *כרובים* plural of *כרוב*, a *great*

or *mighty* one; and for the cherubim, i.e. the similitude of the great ones, were represented by a bull, the chief of the tame animals, the lion the chief of the wild, and the eagle of the winged; and these again were figures of the celestial cherubim, or fire, light, and spirit. The bodies of these three animals were all joined in one, in order to signify the unity of the essence, and the distinction of the persons, and man taken into the efficacy by his personal union with the second person, whose constant emblem was the lion; and Mr. Hutchinson contends, that the very name of the figure was an allegorical representation of the Trinity. The same doctrine is also taught by the word *cherubim*, translated *trinity*; but which the *Hutchinsonians* suppose to signify *name*, being as they say, the plural of *כרוב*, a *name*, and the heavens according to them, are *cherubim* names, because the material heaven, having in its substance three conditions of fire, light, and spirit, is the proper name to representation of the deity in its unity of essence, and trinity of persons; or of the *כרובים*, *cherubim*, or *cherubim*, which they derive from *כרוב*, *cherub*, an *only*, or *essential* impression; and, therefore, must signify persons that have bound themselves by an irrevocable obligation, hereby intimating that the three persons of the Godhead have absolutely consented together, to redeem man. On this account the singular *cherubim*, *cherubim*, the essence existing, is so commonly found in conjunction with the plural *cherubim*, i.e. the *essences* of *cherubim*. They derive *כרוב*, *cherub*, also from the same root, and translate it the *cherubim* referring to Christ, who was really made a curio for us. The word *כרוב*, which we translate *cherubim*, they derive from *כרוב*, *cherub*, and render *cherubim*; and *כרובים*, *cherubim*, which is commonly rendered to *make a covenant*, they translate *let of the father*. In this way Mr. Hutchinson and his followers have founded their whole system of theology and philosophy on a forced and fanciful etymology of Hebrew words; indulging their minds in the wildness of imagination and unbounded whim, making words signify what they please, turning the plainest history into fables, prophecy, and constituting sentences to beacular oracular words, with meanings which they were never designed to bear, and which they are incapable of bearing. The Scriptures, according to this author, written in Hebrew without points, which is the language framed in parallel, and each sort of which represents some obvious acts of action or condition, raised by the sensible object which it expresses, and further designed to signify spiritual or mental things, the Hebrew Scriptures, he says, rightly translated and understood constitute a perfect system of natural philosophy, theology and religion. Mr. Hutchinson expressly says, that as God was primarily represented by the heavens, or emblems, or draughts of three, or descriptions in Hebrew words, were no more than copies of the archetype; and thus the knowledge of the *cherubim* is derived from the light of nature, not as that phrase is vulgarly understood, by any innate or infused power in man, but by the immediate instruction of the Most High, the alone interpreter as well as the lord of nature. The Greeks, he says, that language of erasing heathenism, because of necessary use to the apostles, to spread the history of facts, which it bestowed all men to be apprised of; but Christ and his disciples knew too well in imperfection and darkness to give just ideas of the divine economy, to make use of it for that purpose. The original languages in Hebrew were distinct permanent evidence; to their interpreters are always made, and there complete *cherubim* is to be found. He also observes, that as the material machine is primarily suited to the service of the body; so it is secondary, but most important use, is to secure or secure for the immortal soul, by affording types and evidences of the ever-wise unalterable attributes of the Deity. Hence it must follow, that the language of Scripture, which is admirably adapted to convey true and literal descriptions, will also in many places require an emblematic or typical interpretation, corresponding to the circumstances, and the creature who has a part of love to perceive them. The *Hutchinsonians* not only erect their fanciful system of theological and philosophical opinions on such a foundation of roots and symbols, but the ruin of nature, reason and morality, but they loudly declaim against the *cherubim* and reason; and they expressly call abstract reasoning the very province of the devil.

The reader may find a detailed and complete account of the *Hutchinsonian* system in a book, commonly called *the Hutchinsonian Religion*, &c. printed at Edinburgh, 1773; and in a Letter to a Bishop, annexed to it, published in 1775.

HUXING of *the*, among *Fishermen*, a particular method of catching fish.

For this purpose, they take thirty or forty, as large blades as can be got, blow them up, and tie them close

and strong; and at the mouth of each is a lid, longer or shorter, according to the depth of the water. At the end of the lid is fastened an armed hook, artfully baited; and thus they are enabled to rise with the advantage of the wind, that they may easily move up and down the pond. When a smaller fish has struck himself, it allows a great enlargement to fasten his lower arm in the water with a bladder fastened to him; at last, when they perceive him almost gone, they take him up.

HYACINTH, *Hyacinthus*, in *Botany*, a genus of the *Hexandria monogyna* class. Its characters are these: the flower has no calyx; it has one bell-shaped petal, while the rim is cut into six parts; and three stamens on the point of the calyx, with six short bell-shaped stamens. In the centre is situated a roundish three-cornered germin, having three flowers, which afterwards becomes a roundish three-cornered capsule, having three cells, which contain roundish seeds. There are several species, including many varieties.

All the kinds of this beautiful flower may be propagated either by lowering their roots, or by parting their bulbous roots. The latter has been the method most practised among us, though the former is evidently the way to procure the finest varieties of the flower, and has been always practised in Holland. The first consequence in this is the first autumn and the year after the sowing, which is usually lost in the first year, before the flower is born; but they are raised every year after the first year or five years, there is always a ready succession of seeds from seed.

The first thing they are carefully fixed either from mud, double, or the small finest mud, and sown on a fresh, light, and somewhat sandy soil, in shallow pots or boxes, covering them with half an inch of the time earth. This should be done about the middle of August, and the pots should be placed where they may have the morning sun till the latter end of September; they should then be removed to a somewhat warmer situation, and towards the end of October be put under a common hot-bed frame. In February the young plants will appear above ground, and must be carefully covered from frosts; but they must not be forced, except at night. At the end of March, in good weather, they must be taken out of the frames, and set in a warm place; and when the weather is dry, they must be gently watered at times, and always kept carefully clear from weeds.

Towards the end of April, on the beginning of May, they must be removed into a cooler situation, as the heat of the sun would then be too much for them. After their blades are decayed, they must have no more watering; but towards the latter end of August, a small quantity of light rich earth should be sifted over the pots; after that they must be protected and managed as in the former situation, and in the August following, a bed of a light, rich, sandy soil, should be prepared. Then the earth is to be taken out of the pots and boxes, and the roots, which will at this time be about the figure of a small quill, must be separated and carefully placed upon the bed, at two or three inches distance; they are to be set with the bottom part downwards, and covered two inches thick, with the same fine earth sifted over them. These beds must be arched over, and in July, October covered with manure. In spring, if the weather prove dry, they must be watered frequently. In summer they must be carefully kept clear of weeds, and in autumn have an inch more of light earth sifted over them. In the third year, the roots must be carefully taken up, when their leaves decay, and kept out of the ground till August, then planted into new beds as before, at the distance of six inches distance, where the roots may remain till they flower, and are then in the summer already directed, with this difference, that instead of covering them with manure in the winter, the surface of the ground should be covered with faeces of cows.

When they are in flower, the first four should be marked with a stick, that they may be taken up and planted together.

When the green leaves of these plants begin to decay, their roots must be taken up, and the earth of the bed being raised into a ridge to show off the surface, they should be laid into the earth again in a horizontal position, leaving the green leaves hanging down from the roots, to prevent their moulding from running into the roots, which often happens. When the leaves are quite decayed, the roots are to be taken up and cleared of filth, and laid up in boxes, where they may be preserved dry till September, when it is the time of planting them again. The proper soil for planting them in, is a rich, fine, or a half fresh earth, from a common, for a place which is of a heavy nature, this should not be set beyond nine inches deep; to which add a fourth part of leaf-mould, and a fourth part of coarse cow-dung. This should be mixed a long while before it is used, and often turned; and should be spread two feet deep on the

bed, with a little more cow-dung, or old tanners bark, at the bottom. These beds should be raised from three to four inches above the surface of the earth, in a dry soil, but from ten to twelve inches, if the soil be wet, and be a little rising or rounded in the middle. In June fresh plants over the beds must be set, about four inches thick, and filling the ridges on each side with rotten dung, or food. When the flowers are about to blow, the stalks should be cut down by a hop of wire to a small stick, to prevent their bending down, and they must be the very from the great heat of the sun in the middle of the day, by which means they will continue in flower a month or longer.

When the flowers are quite decayed, and the tops of the leaves begin to decay, they should, for the roots be carefully raised out of the ground with a narrow spade, or some other convenient instrument, to prevent their receiving any more nourishment from the ground, and about a fortnight after this operation, take the roots entirely out of the ground, turn the earth of the bed into a high ridge, and lay the roots into it in a horizontal position, with their leaves hanging out, by which means the moisture of the stalks and leaves will evaporate, and thus be prevented from returning to the roots, and causing them to decay. In this position they should remain, till the green leaves are entirely decayed, which may be in about three weeks time; by which method the roots become firm, and the most correct in form, and of a bright purple colour. After this, take them out of the ground, wrap them each with a soft woollen cloth, taking off all the decayed parts of the leaves and stems, and put them into open boxes, where they may lie till July; and thus they may be preserved out of the ground all September, till the season for planting them again. Mr.

HYACINTH, *Hyacinthus*, in *Botany*, a genus of the *Hexandria monogyna* class. See *Hyacinthus*.

HYACINTH, *Hyacinthus*, in *Botany*. In characters are these: the flower has no calyx; it has one oval, pitcher-shaped petal, which is raised at the stem; it has three stamens on the top of the germin, and six bell-shaped stamens, which are shorter than the petal, whose filaments join together in the centre is situated a roundish three-cornered germin, supporting a single style, crowned by a double stigma; the germin afterwards turns to a roundish three-cornered capsule, having three cells filled with roundish seeds. Their quantities, in *Botany*. Linnaeus makes three species of the *HYACINTH*.

We have several species of this plant cultivated in gardens; three or four for the beauty of their flowers, and one with a perpetual green leaves for the remarkable insectivorous of its fruit. In June, when the leaves of these plants are decayed, the roots should be taken up and placed upon manure in a dry place for a fortnight, till the bulbs are dried; then they may be packed up, each fast by itself, till October, when they are to be planted in borders for flowering the following spring. They should never be suffered to remain in the ground more than two years unremoved; for they multiply so fast that the number of the offsets greatly weakens the flowering roots, and the flowers are consequently small. They are easily propagated by these offsets, which are so ready as to grow even if buried a foot under ground, and the common kind propagates itself in this way, so that when it has once got possession of a bed, it is with great difficulty extirpated.

HYACINTH, in *See* *SCILLA*.

HYACINTH, *Hyacinthus*, in *See* *SPERMATOPHYTES*.

HYACINTH, *Hyacinthus*, in *See* *POLLINARIA*.

HYACINTH, *Hyacinthus*, in *See* *HYACINTH*, a precious stone; originally thus called, from its resemblance of the purple flower named *hyacinthus*.

This is a very different gem from that known by the ancients under the name of the *hyacinth*, which was a variety of the *amethyst*, with a larger admixture of a deep blue, a stone seldom seen among us. The ancients knew this gem, called the *hyacinth* by us, under the name of *Leptocyanus*.

It is a less glossy looking gem than any other of the red ones; but is not without its beauty, which in the finest specimens is great, though not glaring; and is a gem found sometimes of facility as almost any other gem. It is of various sizes, but is seldom found smaller than a hempseed, or larger than a nutmeg. We have had accounts, indeed, of some of a much larger size; but they seem not much to be depended upon. It is not less irregular in shape than size, being found sometimes in the figure of a regularly hexagonal column, terminated by an irregular pyramid, and in all respects, except colour and manner of obtaining from the earth, and as otherwise it is found in form of a small roundish or oblong pebble, generally found on one side. It makes much the best external appearance in its crystalline state; but the

pebble-shaped masses are much the harder, and of the finer lustre. It is less hard than the ruby or sapphire, but much more so than crystal.

It is the ninth in degree of hardness from diamonds, and fusible by fire; changing its red colour into a deep black, but preserving even in this form a great degree of hardness. The colour and fusibility of this stone appear to proceed from iron, a portion of which is separable from it by the magnet.

It is found in various degrees of opacity or paleness; but its colour is always dull or deadish red, with a considerable admixture of yellow, sometimes indeed so much, that the last becomes the predominant colour. It is sometimes so deep as to be almost black, till held up against a strong light, and at others it is almost colourless, and probably not unfrequently is wholly so, though in that case wanting its true character, which is taken from its colour, it is not to be distinguished from pebble crystal on the one hand, nor from the white sapphire on the other, without the assistance of the wheel to ascertain its hardness. Its most usual state, however, is its having that colour mixed of red and yellow, which we usually call flame-colour.

These are the characters by which the *hyacinth* of the ancients, or *hyacinth* of our times, is to be distinguished from all other gems. And our jewellers and lapidaries, according to its different degrees of colour, distinguish it into three kinds, which they call by its own name, with different epithets; and a fourth, which usually, but improperly, is accounted by authors a ruby.

The first kind is the *la bella hyacintha*; this is the name given to the *hyacinth* in its most perfect and beautiful state, when it is of a pure and bright flame-colour, seemingly formed of a mixture of diamondine red, and a moderate proportion of a fine amber yellow. The second is the *yellow hyacinth*; this is the name which they give to this gem, when it has more of the red, and that of a deeper and darker colour, and is tinged with an admixture of a dead and brownish yellow. The third is the *small hyacinth*; this is the name given to those *hyacinths*, which are tinged with a fainter red, in a small proportion, and a dead whitish yellow. The fourth is the *rubicula*, a name given to the *hyacinth* when of a very deep and shining red, blended with a very deep but dusky yellow. The strong colour of the red in this stone has generally made it have a place among the rubies, in the accounts of authors; but a comparison of it with the two gems will evidently shew that it belongs not to the ruby, but to the *hyacinth* kind.

The first of these are the finer *hyacinths*, and are of considerable value. They are brought to us both from the East and West Indies. The *rubicula* is only found in the East Indies, but is of very little value; and the other two varieties are common both to the East and West Indies, and to Silesia and Bohemia, and several other parts of Europe. These are, indeed, sometimes brought over to us from the East Indies, among the finer kind; as is also the *la bella hyacintha* sometimes found in Bohemia, though poor in comparison of the oriental. It is no wonder, indeed, that they should be all found equally in both places, being, in reality, only varieties of the same gem; but the oriental are, in general, much the finer and better coloured.

The stone grates or cuts fine, and would be more used for seals, &c. but that the graving frequently costs more than the stone.

The ancients used it for amulets and talismans; and how it about their necks, or set in rings, &c. supposing it to have the virtue of securing them from the plague, &c.

The *hyacinth* used in medicine, and whereof the collection of *hyacinth* is made, is a different stone from all these, of which there are three several sorts: the first shows the bigness and figure of a grain of salt, and pretty soft; the second reddish, and shaped like the point of a diamond, found in divers parts of Italy, Silesia, Bohemia, &c. The third is white, intermixed with yellow, and some other colours; being found in the same places as the first.

In distillation, only the first kind should be used in the collection of *hyacinth*; but the druggists and apothecaries frequently substitute the other. However, the medicinal virtues of this and other costly concretions, are very doubtful; the preparations from them are very liable to be adulterated, and similar effects may be produced with much greater certainty by other cheaper substances.

HYACINTHIA, in Antiquity, feasts held at Sparta, in honour of Apollo, and in commemoration of his favourite Hyacinth.

This Hyacinth was the son of Amyclas, king of Sparta, and was beloved both by Apollo and Zephyrus. The youth falling much in love with the former, his rival grew jealous; and to be revenged, one day, as Apollo was playing at the discus, i. e. quoits, with Hyacinth,

Zephyrus turned the direction of a quoit which Apollo had pitched, full upon the head of the unhappy Hyacinth, who fell down dead. Apollo then transformed him into a flower of the same name; and, as a further token of respect, they say, commemorated this feast. The *Hyacinthia* lasted three days: the first and third, whereof were employed in bewailing the death of Hyacinth, and the second in feasting and rejoicing.

The persons who assisted at the ceremony were crowned with ivy; because says Voltaire, *De l'Idole*, lib. ii. cap. 14. that Bacchus and Apollo were the same person.

HYADES, *Yahs*, from *hys*, is rain, in *Astronomy*, are seven stars in the Bull's head; famous among the poets for the bringing of rain.

The principle of them is in the Bull's left eye, by the Arabs called *Aldebaran*. Their longitudes, latitudes, &c. see among those of the other stars in the constellation **Taurus**.

The poets feign them to have been the daughters of Atlas and Pleione. Their brother Hyas being torn in pieces by a lioness, they wept his death with such vehemence, that the gods, in compassion to them, translated them into heaven, and placed them in the Bull's forehead; where as they lay, they continue to weep: this collection being supposed to bring rain.

Others represent the *Hyades* as Bacchus's nurses, and the same with the *Dodonides*, who feared the retirement of Juno, and flying from the cruelty of king Lycurgus, were translated by Jupiter into heaven.

HYENA, or *HIENA*, in *Natural History*, a species of the *canis*, with a straight annulated tail, and two hairs of the neck long and erect, a naked ear, and four toes on each foot. It has six cutting teeth, and two canine on each jaw; and between the tail, which is short, and the anus, a transverse orifice. The animal which is known to us by this name is a quadruped almost as large as a wolf, excepting that its legs are not so long; the hair of it is rough, and its skin spotted with several colours. *Hyenas* were formerly produced at Rome in the public games, and they have been represented on some medals, on account of their rarity. Spontheim, who had copies of it engraved from medals, describes it with the head of a maffia, with short triangular ears, a lion's tail and feet, and hair spotted all over like a tiger's. It inhabits Asiatic Turkey, Syria, Persia, and Barbary.

Pliny's account of this animal is very fabulous. He says, that it changes its sex every year; and that from its eyes are taken precious stones, called *hyena*. Aristotle and *Ælian* say, that it makes dogs dumb with its shadow; and that it imitates the speech of mankind, in order to deceive them, and thus draw them out of their houses, and devour them. The superstitious Arabs carefully hairy the head, when they kill a *hyena*, lest it should be applied to magical purposes, as the neck was of old, by the Thracian force. Lucan, lib. vi. 672.

Bellequius, in his *Travels to Amasia*, relates several particulars of this animal. He says it is almost of the shape of a wolf, but not so tall; that its hair is like that of a wolf, except its being more bristly, and marked at certain distances with great black spots; it has no neck, but its head is fastened to the vertebrae of the back, so that it is forced to turn itself quite round, whenever it would look behind. It is very cruel and voracious; it drags dead bodies out of graves, and carries them to its den. It also preys on the herds and flocks. It is said to imitate the voice of a man, and that by this means it often deceives travellers. It is a solitary unocial animal and inhabits the chafins of rocks. These animals have a most malevolent aspect; and they are in their nature cruel, fierce, and unmanageable. See *Tak. III. Quadrupeds*, No. 22.

HYENIUS *hyas*, in *Natural History*, the name of a fable to be found in the eyes of the *hyena*. Pliny tells us, that these creatures were anciently hunted and destroyed for the sake of these fables, and that it was supposed they communicated the gift of prophecy, by being put under the tongue.

HYALE, in *Mineralogy*, one of the nymphs of *Thales*. **HYALINE**, in *Natural History*, derived from *hys*, is rain, the name of a genus of fossils, of the class of the *hydræ*; the characters of which are, that they are translucent, separate plates, of considerable thickness, and that they fill into any manner. See *Tak. of Fossils*, No. 10.

There is but one species known of this genus, which is found lodged in the clay, in the deep bottom of the ocean, in some other places along that river, but it is not known in any other part of the world.

HYALOIDES, in the *Natural History*, is a transparent name of a transparent stone fit to engrave seals, and was the great use they made of the gem, and very bright and readily reflecting the images of things. We have this stone in this day in many parts of America, particularly about the river of the Amazons, from whence

many fair stones of it have at times been brought, and have been by some mistaken for diamonds; they are a sort of pebble crystal, approaching to what the jewellers call the white sapphire. *Hill's Theophrast. p. 80.*

HYALOIDES, from *haleo*, glass, in *Anatomy*, is sometimes applied to the vitreous humour of the eye, contained between the tunica retina, and the iris.

HYANCHIE, a word used by the old medicinal writers to signify a quinty, attended with a swelling on each side of the throat.

HYARITH, a word used by some of the affected classical writers, for silver.

HYBERNAL, *accident*. See OCCIDENT.

HYBERNAL, *erect*. See ORIENT.

HYBERNICUS, *lapis*. See IRIS SLATE.

HYBLEANUM, *blumen*. See BIRCHEN.

HYDROMA, a word used by the old medicinal writers for a gibbosity of the spine.

HYBRISTICA, of *Hydr*, injury, in *Antiquity*, a solemn feast held among the Greeks, with sacrifices, and other ceremonies; at which the men attended in the apparel of women, and the women in that of men, to do honour to Venus in quality either of a god, or a goddess, or both.

Or, according to the account given by others, the *Hybristae* was a feast celebrated at Argos, wherein the women, being dressed like men, insulted their husbands, and treated them with all marks of superiority, in memory of the Argian dames having anciently defended their country with singular courage against Cleomenes and Demaratus.

Plutarch speaks of this feast in his treatise of the great actions of women. The name, he observes, signifies *insanity*, which is well accommodated to the occasion, wherein the women strutted about in men's cloaths, while the men were obliged to dangle in petticoats.

HYDAGE. See HIDAGE.

HYDARTHROS, of *Hydro*, water, and *arthro*, joint, a word used by the ancient writers in medicine to express a clear water running from the joints when wounded or ulcerated. It is a very common symptom in horses, and our farriers call it *joint-water*.

HYDATHIDES, in *Medicine*, are little transparent bags or bladders full of water, frequently found in divers parts of the body.

The word is formed of the Greek *Hydro*, water, which in the genitive signifies *whence*, whence *Hydathides*.

Hydathides are most common in dropical persons, and are supposed to arise from a distention and rupture of the lymphatics; being found chiefly in the parts abounding in those vessels, as the liver, lungs, &c. They are also sometimes found in scrofula. See DROPSY, JAUNDICE, &c.

We have instances of *hydathides* voided both by stool, by urine, and by vomiting. They are of all sizes, from a pin's head to that of a pullet's egg. These tumours are sometimes voided by the vagina. Of this Mr. Watson has given a remarkable instance in *Phil. Trans.* N° 461, p. 276.

HYDATHIDES, *Thuris*, of *Hydro*, water, in *Natural History*, a name given by some writers to a species of *ASTROITES*, the lineations of which resemble waves. It is by others used as a name of the *ENHYDRAS*.

HYDATINON, in the *Medical Writings of the Ancients*, the name of a collyrium made principally of rain-water.

HYDATIS, *Thuris*, called also *Apyda*, in *Medicine*, a disease in the eye; being a fatty substance, growing under the skin of the upper eyelid; by which the whole eyelid, in children, is sometimes rendered edematous.

In order to the cure, an incision is made through the skin of the eye-lid, and the cyst is to be dissected out, if it cannot be drawn away by gently pulling and moving it about. Mr. St. Yves takes notice of a complaint on the edge of the eyelid, or in the tunica conjunctiva, resembling the bladder that appears on the skin after a burn, which he calls *hydatid*. The method of cure which he proposes is to open the tumor with the point of a lancet; but if the whole circumference of the globe is covered with such, the conjunctiva will be inflamed, and bleeding, purging, &c. will be necessary.

HYDATIEM, a word used by some writers in *Surgery*, to express the noise or sound made by the fluctuating humors contained in abscesses.

HYDATOCHOLOS, of *Hydro*, water, and *cholos*, bile, an epithet used by the old writers on medicine, for stools more than ordinary liquid or bilious.

HYDATOIDES, *Thuris*, formed of *Hydro*, water, and *oides*, firm, *resistente*, a name some authors give to the aqueous humour of the eye, included between the cornea and iris.

HYDATOSCOPIA, compounded of *Hydro*, the genitive of *water*, and *scopia*, *vision*, *insider*, called also *HYDROMANCY*, a kind of divination, or method of foretelling future events, by means of water.

There is a natural or allowable kind of *hydromancy*; it consists in foretelling storms, tempests, hurricanes, &c. from natural signs or indications in the sea, air, clouds, &c.

HYDE of land. See HIDE.

HYDE of soil. See HIDE-GILL.

HYDNOPHYLLUM, or *HYDNOPHYLLON*, in *Botany*, a name given by the ancient Greeks to a plant which they tell us grew on those places where the miners or traffickers lay underneath.

They have left us no description of this plant; so that it is not easy to guess what it was; and the whole account seems to be contrary both to their own opinions delivered in other places, and to truth, that there is reason to suspect some error in the case. They tell us, that they were led by this plant to look for the traffickers, and knew by it where they were. But we observe, that in places where traffickers are, there grows no plant at all upon the surface; they also tell us the same thing in other places.

It is probable that some of the writers of this age confounded the traffickers and the bulbocorani, or earthenware. In this case, the leaves of the latter would, indeed, serve as a certain indication; and the *hydronophyllum* would then be only another name for the *bulbocorani*. See UNION.

HYDNUM, in *Botany*, the name of a genus of fungi, in the class of *organismi*, called by Dillenius and Michx., *erecti*. There are a sort of horizontal fungus, which always grow by the side of trees, &c. having no pedicle. There are three of this kind; the *apicis*, which is lamellated underneath; the *lobatus*, which is pinnate underneath; and the *hydnum*, which is echinoid, or beset with pointed fibres on its under-part. The three form distinct genera, comprehending several species in the Linnæan system. See AGARICUS, BOLETUS, and FUNGUS.

HYDRA, of *Lerna*, in *Mythology*, a terrible monster, born of Typhon and Echidna, according to Hesiod, which was destroyed by Hercules. The poets represent it sometimes as a serpent, branched out into several other serpents, and sometimes with a human head, bearing serpents instead of hair; and they add, that when one of the serpents head were cut off, a double head sprang in its place.

This *hydra* with many heads is said to have been only a multitude of serpents, which infested the marshes of Lerna, near Mycenæ, and which seemed to multiply as they were destroyed. Hercules, with the assistance of his companions, cleared the country of them; by burning the reeds in which they lodged.

HYDRA, in *Astronomy*, a southern constellation, consisting of a number of stars, imagined to represent a water serpent. The stars in *Hydra*, in Ptolemy's Catalogue, are twenty-seven; in Tycho's, nineteen; in Hevelius's, thirty-one; and in the Britanic Catalogue, fifty: the longitudes, latitudes, &c. whereof, are as follow:

Names and situations of the stars.	Right Ascension.	Longit.	Latitude	Magnitudes.
1.	9 21 20 22 24 26	1	1	1
2.	9 25 22 24 26	1	1	1

HYDRA, in Zoology. See NATALIS.

HYDRA, in the Linnæan System, is a genus of acropolytes, comprehending seven different species. See POLYPTER.

HYDRAGOGUE, *Thapsia*, formed of *hydr*, water, and *agogus*, to draw, a species of purgative medicine, being such as are supposed peculiarly fitted to discharge ferous or watery humors.

The strongest cathartics, Dr. Galen observes, chiefly answer to the distiller of *hydragoga*; because by their forcibly breaking and relaxing the bowels, and their appendages, they squeeze out water enough to make the stools appear little else.

The principal *hydragoga*, in the common opinion, are the juices of the roots of iris, of foetidilla, mechoacan, jalap, &c. In the general, all foetidilla, appetitive, and diuretic medicines, are truly *hydragoga*.

HYDRANGEA, in Botany, a genus of the *decidua* *di-gyna* class. Its characters are these: the flower has a small permanent embayment of one leaf, and five roundish petals, which are equal; it has ten stamens, which are alternately longer than the petals; under the flower is situated a roundish germin, which turns to a roundish capsule, crowned by two horned stigmas, divided transversely into two cells, filled with small angular seeds. We know but one species of this genus, which is native of North America.

HYDRARGYRISIS, a term used by the surgical writers to express the uniting the body with a mercurial ointment, in order to raising a salivation.

HYDRARGYRUM, *Hyargyrum*, a name given to MERCURY, or quicksilver.

The word is formed of *hydr*, aqua, water, and *argyrum*, silver; or, of *hydr*, water, and *argyrum*, on account of its resembling liquid or melted silver.

HYDRASUS, water-flood, or water-itch, a machine of wood, invented by John Christopher Wageningen, a German, by the help of which a person may walk on the water, without fear of sinking. It resembles the breast, serving the office of the chest in water-flood, and is furnished with apertures for receiving a quantity of fluids, in case of an inundation. The person who uses it is provided with paddles for the feet, consisting of moveable flaps of very thick leather, which open and shut, and are fastened to a wooden

of all the rest, is a pump included in a cistula, or wooden vessel filled with water, and mounted on wheels; the pump being wrought with long levers which come into the cistula; and the water is raised directed to the place by means of a jointed tube.

The Dutch and others use a long flexible tube of leather, fat-cloth, or the like, which they carry or conduct in the hand from one room to another as occasion requires; so that the engine may be applied where the fire is only within sight, and does not burn out to expose it to its external action. To improve on this original fire-engine, they have since contrived to make it yield a continued stream, by substituting a forcing or pressing pump in lieu of the sucking pump. See *Fire-Engines*, and *Forcing Pumps*.

HYDROCARINARUS, in *Zoology*. See *Hater* *Merula*.

HYDROCARCINIA, a term invented by Hillman to express a fecula, fungus, or parasitic tumor of the pericardium.

HYDROCELE, *Hydrocele*, formed of *Hydro*, water, and *Cele*, tumor, in *Medicine*, a swelling, or bursting of the water instrument, or fluid of the testum, occasioned by watery humours detained therein, and called also *Hydrocele*, and *Water scrotum*.

Celsus, De *Testicularibus Naturis*, & Morbis, lib. vi. cap. 18, has long ago observed that there are two species of this disease: the one is a distention of the membranous cellularis, which is termed *Hydrocele testis*, and is formed by a collection of extravasated lymph, deposited and becomes changed to the numerous cavities of the cellular membrane of the testum. The other, commonly called *Hydrocele*, is occasioned by a collection of extravasated lymph confined in the cavity of the tunica vaginalis. In the former case, i. e. when a considerable quantity of extravasated lymph is confined in the cells of the cellularis, or cellular membrane of the testum, the tumour becomes uniformly enlarged; the testicle cannot be felt, and the common integuments appear thickened, tumid, pale, shining, and polished, unless the skin be inflamed, and then the part becomes red. The penis often exhibits similar appearances, and becomes considerably elongated and enlarged by the distention. Upon pressure the tumor feels firm, the integuments assume an inflammation appearance, and for some little time afterwards there remains a depression, or cavity on the spot that was pressed. This affection of the testum is most frequently a symptom of a dropsical habit, and very often accompanies the general anasarca, and the parietal collection within the abdomen, called the ascites. On this account Mr. Fort is of opinion, that this disease is improperly ranked among the species of *Hydrocele*. The relief which the patients can expect must be derived from a proper regimen in diet, exercise, and internal medicines, than from manual operation and topical applications. However, when a reduction of the fluid of the testum and penis become absolutely necessary, a surgeon may risk his best endeavours to procure a temporary discharge of the redundant lymph, and thus to ease the pain, and to prevent mortification. The means of making this discharge are puncture and incision; the former is performed with the point of a lancet, the latter with a lancet or with a knife. Of these two methods of relief, that by simple puncture is much preferable to the other, as it is less painful in the operation, and less liable to pernicious consequences. The incision is proper to be used after the operation should be of the most excellent kind, as beaten cow's milk, or equal parts of hot pearl-water, water and milk, or common salt water and milk; or, a decoction of bran, oat-meal, marsh-mallow leaves, or poppy-heads, prepared in water: the dressings should be changed at five or six times in warm sweet oil, or warm linseed oil, and they may be best then spread with yellow balsam, liniment of *Aloes*, or such digestive ointment. Over the night should be applied a cataplasm of bran and milk made warm, and mixed with a sufficient quantity of clove-wat ointment, or oil of olive, or fresh hog's lard; or, instead of this external remedy may be used, composed of fresh linseed meal and warm water, but in the case of a single puncture, a superficial plastric will be a sufficient dressing. Mr. Fort, excluding this disease from the class of *Hydrocele*, enumerates three different kinds, viz. 1. That which consists of a collection of water in the cells of the tunica communis, or cellular membrane, enveloping and connecting the spermatic vessels. 2. That which is formed by the extravasation of a fluid in the same coat, and contained in one cavity or cyst, whilst the rest of the membrane remains in its natural state. 3. That which is produced by the accumulation of a quantity of water in the cavity of the tunica vaginalis testis. The

first species of *Hydrocele*, when uncombined with any other disease, is perfectly local, is confined to the tunica communis, and does not at all affect the uterus, the tunica vaginalis testis, or any other part. This circumstance little troubles, and is seldom much regarded; whilst it continues of a moderate size, the scrotum has no appearance of a disease, except that it seems rather fuller, and hangs somewhat lower on one side than the other; the testicle with its epididymis may be distinctly felt in its natural state; the spermatic process is considerably larger than it ought to be, and feels like a mass, or like an uncoiled hernia, according to the different size of the tumor: it has a pyramidal form, being broader at the bottom than at the top; and by continual pressure it goes up, but drops down again on removing the pressure. The small degree of uneasiness that attends it is felt in the groin, and not in the testum: when it becomes large and troublesome, it will require a hazardous surgical operation. The second, or specified species of *Hydrocele*, is constituted by water contained in a bag, which is formed like the coats of all encysted tumors, by more or more condensation of the cellular membrane. This is a complaint by no means uncommon, especially in children. It has been often represented as a species of wind-pneumonia, or *HYDRO-PNEUMOCLE*. It most commonly possesses the middle part of the process, between the testicle and groin, and is generally of an oblong figure; whence it has been compared to an egg, and to a fish's bladder. It is moderately tense, so that the fluctuation of the water within it is not easily perceptible; it gives no pain, and is attended with little inconvenience, unless it be very large; it has no communication either with the cavity of the belly above, or that of the vaginal coat of the testicle below it. The testis and its epididymis may be distinctly felt below the tumor; the upper part of the spermatic process in the groin is most frequently very distinguishable. It does not retain the impulsion of the fingers, and a tight strain upon it occasions a loud as if it contained only wind. The posture of the patient produces no alteration in it, nor is it affected by his coughing, sneezing, &c. and it has no effect on the discharge per anum. The diseases with which it is most likely to be combined are the *Hydrocele* of the tunica vaginalis testis, and the true hernia, because the parts within the groin, the spermatic process, and the testum are the seat of all three; but it is distinguished from the former by the tumor's being always above the testicle, and by being the same to the touch in all parts of it, and feeling throughout like a distended bladder; and from the latter by the gradual increase of the swelling, by the insensible state of it, by its being incapable of reduction, and being unaltered by the patient's coughing, &c. In young children, who are more subject to this disease than adults, it is often distinguished in a little while by means of more fermentation, and protruding on open belly. But if it does not degenerate, the water may be discharged by the point of a lancet; whereas in the case of which the cyst becomes sometimes so thick as to require division through its whole length; and the operation may be performed with great ease, and perfect safety. In order to understand the nature and formation of the third species of *Hydrocele*, which is confined to the vaginal coat or bag, which loosely envelops the testicle, it is to be considered that the cavity of this tunic in a natural healthy state, always contains a small quantity of a fine fluid, exhaled by capillary arteries, and continually absorbed by vessels destined to this use; but if the quantity of this fluid be too large, or if the regular absorption of it be by any means prevented, it will be gradually accumulated, and by distending the containing bag form this disease. No period of life is exempt from this malady; adults and young children are subject to it, and infants are sometimes born with it. Ruysch is of opinion that it proceeds from a varicose state of the spermatic vessels, a circumstance which is observed to attend this disorder, whether it be the cause of it or not. The tumor in its first state is rather round, and, as it increases, acquires a pyriform figure, with its larger extremity downwards; it is sometimes hard, and almost indurated; at other times so soft and lax, that both the testicle, and the fluid surrounding it, are easily discoverable. It is insistent in itself, though its weight will produce a small degree of sensible uneasiness in the back. Some have had great stress on the transparency of the tumor, but this is a very fallible criterion, neither can the colour of the fluid be depended upon; but the principal circumstance that distinguishes the simple *Hydrocele* of the tunica vaginalis from the aneurysm (swelling of the scrotum, from the enlarged *Arteriae* of the chord, and from the insinuation of *Arteriae*), is the situation of the tumor. The first is every where equal, tumid

and left; and every where equally receives, and retains the impression of the fingers; the scrota, though circumscribed, not very compressible, and allowing the sensation of fluctuation, yet does not pit, and is alike to the touch in all its parts; and in the third, if the scrota be distensible at all, it is found at the inferior part of the whole tumor.

The method of cure in this species of *hydrocele* are reducible to two, viz. the palliative, which proposes to give present relief by discharging the fluid; and the radical, which aims at a perfect cure, without leaving a possibility of relapse. The instruments commonly used in the former method are the bleeding or the imphothane lancet, and the trocar. Mr. Warner, prefers the imphothane lancet to the trocar, because it is the most easy and expeditious way of evacuating the fluid, and because the tunica vaginalis does not suffer as it does from the cautery of the trocar being left in the wound during the discharge of the lymph. But Mr. Pott thinks that the trocar is preferable to the lancet; because by means of its canula it secures the exit of the whole fluid, without a possibility of prevention. The operation should always be performed on that part of the tumor, where the tunica vaginalis and albuginea are at the greatest distance from each other, and where the fluid must of course be accumulated in the greatest quantity. When the lymph has been totally evacuated, a bit of soft lint should be applied to the wound, and over the lint a piece of sticking plaster; and if the scrota has been considerably distended, it may be necessary to suspend it in a bag-truss. The radical method of cure is by incision, by caustic, by the puncture and test, and by the test; each of which operations has been adopted and recommended by different practitioners. Some have added a fifth kind of operation, viz. that of opening the tumor by incision, and then discharging every drop of the tunica vaginalis; but this method is so tedious, painful, and dangerous, that it is now generally rejected.

The operation by incision is performed with a sharp small knife, having a convex edge and point, and a pair of probe-coasters. The operator embracing the tumor on its upper part with one hand, makes a wound with his knife in the other hand, beginning at the upper and anterior part of the tumor, and continuing it to its inferior extent; by this incision the water is suddenly evacuated, and the tumor disappears; but if the edges of the divided tunic project on each side of the scrota, they must be clipped off with a sharp pair of scissors; and the scrotum may likewise be made use of to enlarge the wound if it should be necessary. The wound must be dressed with dry lint, or with a pledget of lint spread with some soft and cooling ointment, such as the linimentum album, ung. saturnium, or the ung. storacis fampur; over the lint apply a pledget of soft tow spread with the same kind of ointment; suspend the parts in a bag-truss, and pursue the same methods for completing the cure.

In the operation by caustic, a piece of the common paste caustic, rather less than a finger in breadth, properly secured by plaster, is applied to the whole length of the anterior part of the tumor; and when the cicatrix thus produced, falls off, or is divided, an opening of nearly the same length is thereby intended to be made into the cavity of the tunica vaginalis testis; by which means the surgeon has an opportunity of applying such dressings to the inside of the last tunic, as shall by the generation of new flesh, fill up and abolish its cavity.

The radical cure by the puncture and test, is performed by making a puncture in the scrota with a lancet or trocar, and when the contents of the tumor are evacuated, introducing a bit of lint of the size of the orifice, and about three-fourths of an inch in length through the wounded scrota and tunic, but it is necessary first to secure the test by a piece of double-lined gauze through one end of it, that it may not slip into the cavity of the tunic; cover the rest with soft lint, and over the lint apply a bit of sticking plaster; suspend the parts in a bag-truss; when an inflammation commences, remove the plaster, lint, and tow, &c. renew them as at first, a second time. Repeat the operation as often as it may be found safe and expedient for producing a general inflammation of the part. The wound may be superficially dressed with yellow liniment spread on a soft pledget of lint; and the whole scrota may be covered and immersed in a cataplasma, composed of stale crumbs of bread and milk, adding a sufficient quantity of salad-oil, in order to keep the application moist and soft. In the operation by the serena, Mr. Warner recommends a silver needle of a convex form, about six inches long, and tipped with a sharp steel-point. Through the eye of the needle draw a narrow ribband or tape, about ten or eleven inches long, fastened

with oil or pomatum; introduce the point of the needle through the upper and anterior part of the tumor, or through its upper and exterior part, and its convex side towards the testicle; direct it downwards to the lower end of the tunica vaginalis and scrota, and there puncture the integuments quite through; then convey the needle and ligature downwards, till it may be properly secured. Let the ribband remain unmoved for forty-eight hours; observing to draw it upwards and downwards once or twice a day, as may be thought needful. Treat the patient in the manner already advised in the account of the other operations. See on this subject Pott's Treatise on the Hydrocele in his surgical works, vol. ii. p. 197, &c. Warner's Account of the Testicles, &c. p. 26, &c. Ellis's Treatise on the Hydrocele of the Tunica Vaginalis Testis.

HYDROCEPHALUS, *ὑδροκεφαλή*, formed of *ὑδρ* water, and *κεφαλή*, a head, in *Medicina*, a watery head, or dropsy in the head.

The *hydrocephalus* is a congection of water in the head, so as to distend and tender it soft.

There are two kinds of *hydrocephalus*. The first, when the water is gathered between the skull and the skin, called *hydrocephalus externus*; the second when it is collected between the skull and the brain, or in the ventricles of the brain, called *hydrocephalus internus*.

Children are much more liable to *hydrocephalus* than adults; by reason their head is soft, and has been much compressed in the womb; or perhaps by their having been too roughly handled by the midwife; add that the bones of children's heads being very soft, and their sutures not yet exactly closed, they easily open, and give way to an influx of water from without; whereas, in adults, the bones of the cranium are very hard, and closely bound together; nevertheless, instances occur in which they have been seized with this disorder.

The internal *hydrocephalus* is a disease very difficult, if not absolutely impossible to cure. It sometimes ends in mortal convulsions, and sometimes in lethargy, or apoplexy.

The head, in this case, is sometimes extended to a prodigious bulk, so that the person cannot bear or sustain it. Of this we have an extraordinary instance given us by Dr. Friend, of a girl two years old, whose head was twenty-six inches in circumference. Philoeph. Transact. No 378.

We owe to Mr. Hanauld, of the Royal Academy of Paris, some very singular and valuable observations on this remarkable subject. This gentleman, examining the head of a child which had died at seven months old of a *hydrocephalus*, found it larger in all parts, except before, than that of an adult. Toward the face, the skull was no larger than is natural at that age; but sideways and behind, it had swelled to this monstrous bulk. The water was included in the ventricles, and was in quantity a pint.

On considering what could be the time when this unhappy disorder began, it appeared to that gentleman, that it did not happen till after the bones of the skull began to be joined to one another by the sutures; for otherwise the head must have been in the same state with those in which the *hydrocephalus* has begun earlier; in which case, the bones of the skull separate themselves to a great distance one from another, and the membrane which unites them to one another is extremely extended. The beginning of this *hydrocephalus* must have been at a time when the bones of the skull, united by their sutures, had already had time considerably to extend themselves; and the action of the water on the sides of the ventricles, and on the brain, forced the bones of the skull to take this unnatural growth. And from the whole, it is easy to conclude, that those children in whom a *hydrocephalus* begins before the bones of the skull are thoroughly united, must have some defect in time.

The effect which the water, contained in the skull, had on the brain, in the case mentioned above, is well served to be remarked. The bones of the skull, united in a natural size, applied closely together, and therefore leave no terrible cavity; and in this case, the sides were so far separated, that the cavity contained a pint of water. If such a case had happened, that the substance of the brain, and the membranes, these sides, must have been considerably diminished, and the cortical substance must also have been greatly extended beyond its natural dimensions. And, in order to be capable of this extension, it was found without any circumscription, and made only a flat even surface regularly of that extent and size that would result from the expansion of all its circumscriptions. The medullary substance

substance formed a second even surface like the former. This was very thin, and lay under the former. The reason of this disposition of the parts of the brain in this case is obvious; for the pia mater not having in this case, the convolutions of the brain to follow, as in a natural state, formed of itself a flat substance upon the cortical part.

It is evident, from these observations, and from others in Velutius and other authors, that the brain may, from accidental cause, become of a growth and figure very different from what it naturally would have had; and that the very bones of the skull are in like manner capable of assuming a different figure and growth, and that even after they have acquired a great deal of their natural thickness and hardness, and are capable of resisting, with considerable force, the accidents which tend to determine this unnatural growth in them; and applying this to the case of a tender fetus, in which the parts have yet force and degree of solidity or hardness, we shall see an easy account of all the unusual configurations which anatomists sometimes meet with in the skulls of adults. *Mémoires de l'Académie de Médecine, Par. 1740.* Dr. Fothergill observes, that the *hydrocephalus internus* is much more frequent than persons generally imagine; and this is the more to be lamented, as it has hitherto baffled the skill of our ablest physicians. A single instance only occurs under the cure of Dr. Watson, out of a great number, in which a recovery was effected. It appears from several dissections, that the proximate cause of this disease is a collection of clear pellucid lymph, amounting in some cases to two, three, four, or five ounces, contained in the ventricle of the brain under the corpus callosum, from whence it is impossible to discharge it by any medicine, or operation hitherto discovered. Dr. Fothergill submits to consideration, whether this extravasated lymph may not proceed from the breach of a lymphatic. This conjecture is confirmed by its happening more commonly to healthy, active, lively children, than to such from whom in previous indisposition, there is room to suspect any unequal or weakened absorption. Besides, accidents have often preceded this complaint. Dr. Watson is of opinion, that whenever this kind is productive of disease and death, its effects arise not from any preternatural accumulation, but from the ventricles being overloaded with it; so that it forces the brain against the skull, and impedes the free passage of the blood through the vessels of the brain and its meninges; and, by its pressure, disturbs the functions of the brain itself; and its effects on the optic nerve are easily seen in the sensibility of the retina, and at length in a loss of sight and dilatation of the pupil to its greatest extent. The same cause affecting the third pair of nerves, which are subservient to the motions of the eyes, occasions the irregular convulsive motions and distensions which are usually observed in that organ in the course of this disease. A greater degree of distension of the brain, and its compression from this fluid brings on general convulsions, and is most usually fatal. The disorders to which the *hydrocephalus externus* bears the nearest resemblance, are such as are supposed to proceed from worms; many of the same symptoms occur, and indicate the necessity of prescribing antehelminthics. Dr. Whytt supposes that this disease is gradually formed, and that it continues some weeks before it ends fatally; but Dr. Fothergill has met with many cases of persons who were well, healthy, and active, that have been seized with it, and carried off in about fourteen days; nor has he seldom been able to trace the commencement of it above three weeks. The first complaint in this disorder is a pain somewhere below the head, most commonly about the nape of the neck and shoulders, often in the legs, sometimes, but more rarely in the arms; when the pain does not seem to affect any of the limbs, the head and stomach are most disordered. In the course of three, four, or five days, after children have been first seized, they have commonly complained of a very acute pain in the head; extending from the forehead from temple to temple; this is attended with occasional sickness and vomiting, regular hiccoughing, and much fighting. The pulse is at first slower than it ought to be; and as the pain increases, becomes gradually slower and irregular. The first access of the disorder is often attended with feverish heat, afterwards the heat subsides till within a day or two of the dissolution of the patient, when the pulse becomes extremely quick, the breathing deep, irregular, and laborious, and the heat excessive and more general. The head and extremities are always hot from the first attack. Every symptom almost that attends an irritating cause in the brain appears in its turn; first, pains in the limbs, sickness, and head-ache; then disturbed sleep, startings, irregular pulse, watchfulness, and considerable

dilatation of the pupils. The patient is unwilling to be disturbed, averse to light, takes things greedily, and can bear no posture but that of lying horizontally. The whites of the eyes are much seen when he is asleep; the urine and stools come away infrequently; he often screams, and puts one or both hands to his head; at length the eyelids become paralytic, and the iris immovable. The heat of the head and trunk become excessive, a great heat and sweat poured over the whole body, respiration is altogether laborious, the pulse trembling, and very quick; and sometimes a faint terminates the disorder in death. Many of these symptoms are familiar to worm cases, tooth, and other irritating causes; but the pains in the limbs, and incessant hiccough, and sickness seem to be the most certain intimations of the danger. The patient in this disease is very colic; and the stools, which are procured with great difficulty, are commonly of a dark greenish colour, with an oiliness, or phlegmy bile, and singularly offensive. In the earlier stages of this disease, it is usual to treat it as if it proceeded from worms, or some irritating cause capable of being removed. Three or four grains of calomel, or more, according to the age and habit of the patient, with rhubarb and the pulv. e. scamm. compot. are given to empty the bowels; and if the stomach appears to be loaded, one fourth, or one half of a grain of the emetic tartar may be joined with it, and the stomach washed with any suitable liquor. After this, it seems prudent to abate the vomiting by the saline absorbent medicines, adding a few drops of the tincture of balsam of capivi, or some decoction of the tincture of hartshorn flavings, and other proper supports. Antelminthics in broth are administered by way of clysters, and occasionally small doses of anodynes; a decoction of lemon, fennel, with thirty-eight or forty drops of oil of turpentine, in three or four ounces of broth, or alex. bolus with milk. Heating medicines, and a great degree of internal warmth increase the malady; when the disease proceeds from worms, the symptoms abate by this practice; but if they continue it is of a more fatal kind. The most pressing symptoms however should be dealt by the application of blisters, sinapisms, and embrocations externally, and by the least heating antispasmodics internally; and the bowels should be always kept as much as possible free from impurities. Dr. Boerhaave also recommends diuretics, and such medicines as promote the secretion of urine; a discharge from the nose ought likewise to be promoted, by causing the patient to snuff the powder of alum, white hellebore, or the like. *London Med. Observ. and Inquiries, vol. iv. p. 40, &c. p. 75, &c. p. 321, &c.* Weyn's History of the *Hydrocephalus*, in a tract at the end of his works. Buxton's *Mem. Med.* p. 617, edit. 1756.

In the external *hydrocephalus*, where the water is retained between the common integuments and the cranium, there is some hope of a cure, especially if it be not of very long standing. Internal medicines must be given; these must be cathartics, diuretics, and diaphoretics; and at the same time externally large compresses, covering the whole head, must be applied, dipped in lime-water and spirit of lavender, or Hungary-water. Bags of the dried herbs of lavender, marjoram, penny-royal, and the like herbs, may be vetted in the same liquors, and applied; and the frequent use of an erucic made of marjoram, lily of the valley, marum, and the like, should be recommended, as also the chewing of tobacco, to discharge the viscidities in form of saliva. If these do not succeed, a blister must be tried behind the ears, on the occiput and neck, and cupping on the parietal sinuses and fetors also are of great use. And, in the cupping the scarification may be made very deep, and afterwards dressed with digestive ointment and precipitate, to keep up the discharge. *Hist. of Surgery, p. 335.*

But even in this disease, as well as in the *struma bifida*, when, through ignorance or design, the Integuments have been divided, and the contained fluid evacuated, life has continued but for a short time after the operation.

HYDROCRATOPHYLLON, in *Bistany*, the name given by Vaillant, and many others, to a genus of plants called by Dillenius, *dichotophyllum*; and by Linnaeus, in his *Genera Plantarum*, *CRATOPHYLLUM*. Vaillant, *Act. Germ.* 1710.

HYDROCHARIS, *frag. bit.* in *Bistany*, the name of a genus of plants of the *dicotyledonous* class. The characters of the genus are these: the flowers are some male, others female; in the male the cup is a two-leaved oblong spatula, containing two flowers; the peculiar perianthium of each flower is composed of three leaves, of an oblong oval figure, hollow, and with membranaceous edges; the flower consists of three large petals, flat, and of a rounded figure; the stamina

or nine erect pointed filaments, disposed in three orders; the anthers are simple; the pistil is a sort of rudiment of a pistil in the centre of the flower; in the female flowers there is no stigma, but the flowers grow each by itself; the perianthium and petals are the same as in the male; the pistil has a roundish germ placed under the cup, and from this arise six styles of the length of the cup; these are compressed and furrowed; the stigmas are blunt and pointed; the fruit is a coriaceous capsule of a roundish figure, containing six cells; the seeds are very numerous, and are small and roundish.

HYDROCHERUS, in the Linnæan system of *Zoology*, a species of frog found at Surinam. See *CERYNAX*.

HYDROCHOS, in *Astronomy*, derived from *hydro*, water, and *chos*, I saw. See *AQUARIUS*.

HYDROCOXIA, in *Ornithology*. See *BUCCOX*, and *COXA*, *JACIUS*.

HYDROCOYLE, in *Dipsos*. See *MORPH*, *PERRY*, *WERT*.

HYDRODES, *febris*, a fever, in which the patient is, from the beginning, afflicted with very copious and weakening sweats, and great weakness.

HYDRONAMICS, or *hydrostatics*, and *hydrostatics*, is that part of the science of the laws of the motion of fluids, and denotes the same with *HYDRAULICS*.

HYDROGARON, a wine used by some of the old authors for gum, or brine diluted with water, and used as a purge, taken in large quantities.

HYDROGRAPHICAL MAPS, more usually called *sea charts*, are projections of some part of the sea, in plans, for the use of navigation.

In these are laid down all the rhumbs, or points, of the compass, the meridians, parallels, &c. with the coasts, capes, islands, rocks, shoals, shoals, &c. in their proper places, proportions, &c.

Christopher Columbus, the first great discoverer of America, was a man that carried his living by making and selling *hydrographical maps*. He happened to be here to the manners or journals of a noted pilot, one Alonso Sanchez de Huelva, captain of a ship, who, by chance, had been driven by a storm to the island of St. Domingo, and died at Columbus's house soon after his return. This was Columbus, the first that attempted a discovery of the West-India, in which he succeeded.

For the construction of the several kinds of *hydrographical maps*, see *CHARTS*.

HYDROGRAPHY, compounded of *hydro*, water, and *grapho*, *Lithicæ*, that part of geography which considers the sea; principally, as it is navigable.

Hydrography teaches how to describe and measure the sea; it gives an account of its tides, counter-tides, currents, eddies, byes, gulls, &c. as also of its rocks, shoals, banks, shallows, promontories, harbours, distances, &c. from port to port; with all that is remarkable, either as to sea, or on the coast.

None of the best authors use the term in a more extensive sense; so as to denote the same with *navigation*.

In this sense *hydrography* includes the doctrine of sailing; the art of making sea charts, with the uses thereof; and every thing necessary to be known, in order to the safest and most expeditious performance of a voyage. See *SAILING*.

Hydrography is the most perfect of all the mathematical sciences; there being scarce any thing wanting to its perfection, but the discovery of the longitude.

The Jesuit Riccioli, Founder, and de Chales, have written on the subjects of *hydrography*.

In France they have professors of *hydrography* established in all their sea-ports, who are to instruct the youth intended for the sea, in all the parts of navigation, sailing, steering, &c. with the several branches of mathematics necessary thereto; as arithmetic, and the doctrine of the sphere, and trigonometry.

They are also professors, and teach gratis; having salaries allowed them by the king. They are also charged with the examination of pilots, &c.

HYDROLEA, in *History*, a genus of the *pentandria digynia* class; the calyx is five-toothed, the corolla tubular, and the fruit is a double-lobed and double-valved capsule. There is only one species.

HYDROLOGY, compounded of *hydro*, water, and *logos*, science, denotes that part of natural history, which examines and explains the nature and properties of water in general.

HYDROMANCY, or *hydromancy*, compounded of *hydro*, water, and *mancy*, divination, the art, or art, of divining, or foretelling, future events, by means of water.

Hydromancy is one of the four general kinds of *divination*; the other three, respecting the other ele-

ments; viz. fire, air, and earth; are denominated *pyromancy*, *aeromancy*, and *geomancy*.

Vario mentions the Persians as the first inventors of *hydromancy*, adding, that Numa Pompilius, and Pythagoras, made use thereof.

This species of divination was performed in various ways: sometimes they used invocations, and magic ceremonies, in consequence of which they discovered the names of certain persons, or events, which they wished to know upon the water: sometimes they suspended a ring by a thread over a vessel full of water, and struck the sides of the vessel with it a certain number of times: they also formed presages by casting small stones into still water, and observing the circles hereby formed on the surface of the water: by examining the various agitations of the waves of the sea: by observing the colour of the water, and the figures represented in it, &c. &c. See an account in Delrio Disquis. Magic. lib. ii. quest. 6. sect. 3.

The writers in optics furnish us with divers *hydromantic* machines, vessels, &c.

To construct an *hydromantic* machine, by means whereof an image, or object, shall be removed out of the sight of the spectator, and returned again, at pleasure, without altering the position, either of the one or the other. Provide two vessels, *ABF*, *COLK* (Tab. IV. *Hydromanticæ*, fig. 21.) the uppermost filled with water, and sustained by three little pillars, one whereof, *BC*, is hollow, and furnished with a cock *B*. Let the lower vessel *CF*, be divided by a partition *HI*, into two parts; the lower whereof may be opened, or closed, by means of a cock at *I*.

Upon the partition place an image, which the spectator in *O* cannot see, by a direct ray *GL*.

If now the cock *B* be opened, the water descending into the cavity *CF*, the ray *GL* will be refracted from the perpendicular *GR* in *O*; so that the spectator will now see the object by the refracted ray *OG*. And again, shutting the cock *B*, and opening the other *B*, the water will descend into the lower cavity *HF*; whence, the refraction ceasing, no ray will now come from the object to the eye's; but, shutting the cock *B* again, and opening the other *B*, the water will fill the cavity again, and bring the object in sight of *O* afresh.

To make an *hydromantic* vessel, which shall exhibit the images of external objects, as if swimming in water. Provide a cylindrical vessel *ABCD* (Tab. IV. *Hydromanticæ*, fig. 22.) divided into two cavities by a glass *EY*, not perfectly polished: in *G* apply a lens convex on both sides; and in *H* incline a plain mirror, of an elliptic figure, under an angle of 45° ; and let *IH* and *HG* be something less than the distance of the focus of the lens *G*; so that the place of the images of an object radiating through the same may fall within the cavity of the upper vessel: let the inner cavity be blackened, and the upper filled with clear water.

If, now, the vessel be disposed in a dark place, so as the lens be turned towards an object illuminated by the sun, its image will be seen as swimming in the water.

HYDROMEL, or *hydromel*, composed of *hydro*, water, and *melis*, honey, a drink made of water and honey, nearly in equal quantities; called also by the Greeks, *melicaria*.

When this liquor has not fermented, it is called *simple hydromel*; and compound, when other ingredients are added to the water and honey, in order to improve and exalt the flavour and virtues.

When it has undergone the spirituous fermentation, it is called the *vinous hydromel*, or *mead* and *methygen*. To induce this fermentation, nothing is necessary but to dilute the honey sufficiently in water, and to expose the liquor to a convenient degree of heat.

Hydromel is the common drink of the Poles and Russians: Diodesius Siculus, lib. v. and Aristotle, relate, that the Colchians, and Taurians, ancient people of Illyria, drank *hydromel* instead of wine.

HYDROMELON, a name given by the ancients to a liquor prepared with one part of honey, three parts with the juice of quinces, and two parts of boiled *mead* for use in the fun during the dog-days.

HYDROMETER, compounded of *hydro*, water, and *metron*, measure, an instrument wherewith to measure the gravity, density, velocity, force, or other properties of water.

That wherewith the specific gravity of water is determined, is often called an *areometer*, or *areometer*.

The general principle on which the use of a *hydrometer* depends, has been mentioned under the article *SPECIFIC GRAVITY*: for it has been there shown, that a body specifically lighter than several fluids will serve to find out their specific gravities; because it will sink deeper in the fluid whose specific gravity is the least.

Thus,

Thus, let $A B$, (Tab. II. *Pneumatics*, fig. 25.) be a small even glass tube, hermetically sealed, having a scale of equal divisions marked upon it, with a hollow ball of about an inch in diameter at bottom, and a smaller ball C under it, communicating with the first. Into the little ball put mercury or small shot, before the tube be sealed, so that it may sink in water below the ball, and stand upright, the divisions on the stem shewing how far it sinks. If this instrument be dipped in common water and sink to D , it will sink only to E in salt water; but in Port wine it will sink to F , and in brandy under proof, it will perhaps sink to B . It is evident that an *hydrometer* of this kind will only shew that one liquid is specifically heavier than another; but the true specific weight of any liquid cannot be determined without a calculation for this particular instrument, the tube of which should be truly cylindrical, and not tapering as they commonly are. Besides, these instruments will not serve for fluids, whose densities are considerably different. With a view of remedying these and some other inconveniences, Mr. Clarke constructed a new *hydrometer*, for the use of dealers in brandy and spirits, that they might be able to determine, by inspection, whether any spirituous liquor be proof, above proof, or under proof, and exactly in what degree. This instrument is made of copper, because ivory imbibes spirituous liquors, and glass is apt to break. It consists of a brass wire about one-fourth of an inch thick, passing through and soldered into the copper ball B , (see fig. 26.) The upper part of the wire is filed flat on one side for the stem of the *hydrometer*, and marked at m , to which division it exactly sinks in proof-spirits. There are two other marks A and B ; the one shewing that the liquor is one-tenth above proof, when the instrument sinks to A , and the other indicating one tenth under proof when it emerges to B ; a brass weight, as C , having been previously screwed on to the bottom at c . There is a great variety of weights of different sizes, as K , &c. adapted to liquids that differ more than one tenth from proof, and for determining the specific gravities of all such liquids as occur in trade, as well as for shewing the specific gravities of all fluids quite to common water. The round part of the wire above the ball may be marked acroft, as in fig. 27, so that with the weight as C , which fits the instrument for the trial of river water, in which it sinks to $R W$, it may serve for wines or other waters: thus in spring water it will sink to $S P$; in mineral water to $M I$; in sea-water to $S E$; and in the water of salt springs to $S A$: and the marks h, r, o, p, m , denote the divisions to which the instrument descends in Brilist water, rain water, Port wine, and Mountain wine, respectively. Phil. Trans. abr. vol. vi. p. 326, &c.

Dr. Desaguliers contrived an *hydrometer*, for determining the specific gravities of different waters to such a degree of nicety, that it would shew when one kind of water was but one forty thousandth part heavier than another. This instrument (see fig. 28.) consists of $C B A$, a hollow glass ball of about three inches in diameter, with a small ball under it of about an inch in diameter. To a short neck at C there is fixed a brass head, with a fine screw, into which the piece $C c$ is to be screwed; and this piece is joined to a wire $C A$, about one fortieth part of an inch in diameter, and ten inches long, which is divided into inches, and tenths of inches. Having put a certain quantity of small shot into the ball B , so that when the head $C c$, with its wire $C A$, is screwed on, it shall sink as far as D , e. g. five inches, in river or soft spring water, we may know by observing how far this *hydrometer* sinks lower in one kind of water than another, their different specific gravity to a forty thousandth part, which corresponds with one tenth of an inch marked on the stem $A C$. For let the *hydrometer* float in water in the jar $I K L M$, and the surface of the water cut the stem at D , a grain weight laid on the stem at A , will cause the instrument to sink, till the mark D of the stem settles one inch under the surface; and therefore, a grain depresses it an inch. The *hydrometer* weighs four thousand grains, and every inch of the graduated wire weighs ten grains; and, therefore, the part of it $D C B c$ & D must weigh three thousand nine hundred and fifty grains. But it is known from the principles of specific gravity, that a bulk of water equal to $D C B c$ & D , the immersed part, weighs just as much as the whole *hydrometer*, or four thousand grains; and, therefore, this instrument serves to compare together the different bulks of four thousand grains of water, according to their different specific gravities; and since the whole instrument is sunk an inch by the weight of one grain, and the instrument will stand at one tenth of an inch, the difference indicated by it in waters in which it floats, it is evident that it will distinguish the truth of a grain in four thousand, or the forty thousandth part of the whole bulk of water. By altering the quantity of shot

in the ball B , the instrument may be prepared for the comparison of any other two liquids that are nearly of the same specific gravity. Desaguliers, &c. vol. ii. p. 234. This instrument is capable of still greater exactness, by making the stem of a flat thin slip of brass or of steel, by which means we increase the surface without diminishing the solidity: on one side of this stem may be several marks denoting the depths to which the instrument would sink in various sorts of water, as rain water, river water, &c. and on the other side may be the divisions to which it would sink in lighter fluids, as hot-water, Brilist water, Port wine, &c. but in determining the strength of spirituous liquors, a cylindrical stem is best.

Mr. Quin has lately constructed an *hydrometer*, recommended by many distillers, &c. on account of its accuracy, which requires only eighteen weights used on the top of the instrument, to shew all the under and over proofs to the certainty of one pint in a hundred gallons, from proof to seventy gallons to one hundred over proof, and to fifty gallons in a hundred under proof, which would require nine hundred and fifty-eight weights, besides forty-five air weights, according to the old construction of Clarke's *hydrometer*. The weights are numbered 10, 11, 12, 23, 14, 15, 16, 17, 18, 19, 20, 30, 40, 50, 100, 200, 300, 600 grains. He has also formed a table shewing the degrees of the thermometer, and the number of grains corresponding with each degree; the number of grains required for each strength; the over proofs, or the quantity of water necessary to reduce one hundred gallons of spirit to proof, with the former manner of expressing the several preparations, as one to two, one to three, &c. and likewise the under proofs. There is one circumstance, which deserves particular attention in the construction and graduation of *hydrometers* for determining the precise strength of different brandies, and other spirituous liquors. M. Reaumur, in making his spirit thermometers discovered, that when rectified spirit and water, or phlogon, the other constituent part of brandy, are mixed together, there appears to be a mutual penetration of the two liquors, and not merely juxtaposition of parts; so that a part of the one fluid seems to be received into the pores of the other; thus e. g. if a pint of rectified spirit be added to a pint of water, the mixture will be sensibly less than a quart. The variations hereby produced in the bulk of the mixed fluid, render the *hydrometer*, when graduated in the usual way, by equal divisions, an erroneous measure of its strength; because the specific gravity of the compound is found not to correspond to the mean gravity of the two ingredients. M. Montigny constructed a scale for this instrument in the manner before suggested by Dr. Lewis, on actual observation of the sinking or rising of the *hydrometer* in various mixtures of alcohol and water, made in certain known proportions. Hist. de Acad. Roy. Sciences, &c. Paris, for 1768, Memoire de Neumann's Chem. by Lewis, p. 450, note r .

M. de Lue has lately published a scheme of the construction of a comparable *hydrometer*, so that a workman after having constructed one upon his principles, may make all others similar to each other, and capable of indicating the same degree on the scale, when immersed in the same liquor of the same temperature. For this purpose he proposes to use an *hydrometer* of the common construction, such as is represented in fig. 29. made of flint glass; because glass is a substance which undergoes the least change of bulk by heat, and its changes are the most regular. The ball should be one and a half inch in diameter, with which should communicate a small hollow cylinder b , containing such a quantity of quicksilver for a ballast, that the instrument may sink nearly to the top in the most spirituous liquor, made as hot as possible. To the ball a is cemented a thin brass tube silvered over, or a silver tube $c c$, made perfectly cylindrical, by drawing it through a hole. This tube, or branch, as he calls it, should be long enough to admit the immersion of a small part of it in the less spirituous liquors, e. g. wine reduced to congelation. In order to determine a standard for the construction of the scale of this instrument, he forms a weak spirit of wine, by mixing one part of water with six parts of such spirit of wine as fire gun-powder, or linen steeped in them. He also finds the specific gravity of this mixture, at the temperature of fifty-four and a half of Fahrenheit's thermometer, by a nice hydrostatical balance. Having dipped the *hydrometer* into this spirit of wine, at the fixed temperature, he marks upon its branch or stem with a thread, the point to which it sinks; then preparing a sort of brandy stronger than the common, by mixing three parts of water with seven parts of this same spirit of wine, he determines the point on the stem to which the instrument would sink in it at the same temperature; and marks it with a thread. These

points, viz. 45 and 15 in the figure, are the fixed points of the *hydrometer*. The interval between them may be divided into thirty equal parts, each of which will represent one thirtieth part of the total effect of the superadded water, or the specific gravity of the liquor. This fundamental interval in instruments for common use may be divided into fifteen parts, which will then be double degrees. In order to find a convenient place for the 0 of this scale, M. De Luc proposes to reduce one of the wines of which brandy is commonly made, to the temperature of water in ice, and dipping the *hydrometer* in it, to observe how much higher it will stand than the inferior fixed point. This excess of emersion, compared with the fundamental scale, and reduced to the nearest number of degrees which will be an aliquot part of it, will be a proportional quantity invariably fixed, to be added to the scale below the inferior fixed point, for determining the place of 0. e. g. let this excess of emersion be about 15°, or half the fundamental scale; then one should constantly add half the fundamental distance below the inferior fixed point, and thence begin to count the degrees: so that 0 would be at the bottom of the whole scale; the inferior fixed point would be at 15°, the superior at 45°, and the scale could be prolonged as they stand as may be necessary for the class of the most spirituous liquors. Another scale may be applied on the opposite side of the stem, for trying merely the specific gravity of the liquids in which the *hydrometer* may be dipped. The particular fixed points of this scale, e. g. 45°, may be taken in any two liquids, whose specific gravities, tried by the hydrostatic balance, shall have a convenient relation, and the space between these two points will be divided into a convenient number of equal parts. For the correction on account of the differences of heat, M. De Luc would take a liquor of mean spirituousity, e. g. a mixture of one part of water, and seven parts of the spirit of wine determined by the hydrometric balance; reduce this liquor to the temperature of 45° of Fahrenheit, plunge into it the *hydrometer* already graduated, and observe the point to which it sinks; he proposes afterwards to heat the liquor to 65°, and then to observe the sinking of the instrument. From this observation a table might easily be formed, in which we might express in degrees of the *hydrometer*, the effects of the differences of heat corresponding to each degree of the thermometer, beginning from a fixed point: or, a particular scale might be prepared for experiments of this nature, by changing the number of degrees contained between the fixed points, in order to establish an easy proportion between them and the degrees of the thermometer; and thus the correction might be made without tables. If an *hydrometer* of this kind were come into general use, the police of the places in which the trade of spirituous liquors is carried on, might take cognizance of it; and keep the public standard of the *hydrometer* or arcometer, as they keep the standards of weights and measures. Phil. Trans. vol. lxxviii. part I. art. 26. p. 300, &c. Mr De Luc has also published a proposal for constructing comparable *hydrometers*. Hist. de l'Acad. des Sciences, Paris, for 1750. Mem. 2.

HYDROMETRIA, HYDROMETRY, the mensuration of water, and other fluid bodies, their gravity, force, velocity, quantity, &c.

Hydrometria includes both **HYDROSTATICS** and **HYDRAULICS**.

The term is modern, but very little in use. The first instance where we meet with it, is in the year 1691, when a new chair, or professorship, of *hydrometry*, was founded in the university of Bologna, in favour of S. Guglielmini, who had carried the doctrine of running waters, with respect to rivers, canals, dykes, bridges, &c. to an unusual length.

HYDROMPHALUS, *Θυμπαλῖς*, formed of *θυμ*, water, and *φαλῖς*, navel, in *Medicine*, a tumor in the navel, arising from a collection of water.

The *hydromphalus* is distinguished from other tumors of the navel, by its being very soft, and yet not tractable and obdurate to the touch, so as to diminish or enlarge, by compressing it. When viewed, placed between the eye and the light, it is found transparent.

The *hydromphalus* is to be dissolved by emollient and resolutive medicines. It is also cured by a puncture made in the middle of the navel. See **DRYSIS**.

HYDROMYSTES, or HYDROMISTA, compounded of *θυμ*, water, and *μυστα*, a person set apart for the office of washing, a name anciently given to certain officers in the Greek church, whose business was to make the holy water, and sprinkle it on the people.

HYDROPARASTATÆ, or HYDROPARASTÆ, in *Eclectic History*, a sect of heretics, the followers of Tatian; called also Encratites, Apocritæ, Sacerdotes, Severiani, and Aquariani.

The word is formed of *θυμ*, water, and *μυστα*, *Epist.*

The *hydromphalus* were a branch of Manichees, whose distinguishing tenet was, that water should be used in the eucharist instead of wine.

HYDROPHANÆ, in *Natural History*, the name of a genus of the terni-pellucidæ gemi.

The word is derived from *θυμ*, water, and *φανη*, to shine, the distinguishing character of these stones being, that they become lucid on being plunged into water.

They are semi-transparent stones, composed of crystal and earth, the latter ingredient being in large proportion, and mixed but imperfectly, as in the chalcedony, and giving a general milky or cloudy look to the mass, but considerably opaque, and not capable of a fine polish, but appearing of a dusky and foul surface, till thrown into water, in which they become lucid. And in some degree transparent, and either in part or wholly change their colour, which returns to them again when taken out and dried. Of this genus we know only two species, one a whitish grey, without veins, called *lapis malabaricus*, and *oculus maris*; and the other a whitish-grey one, variegated with yellow, and with a black central nucleus, called by authors the *oculus falæ*.

HYDROPHOBIA, *Ψυλλῖς*, compounded of *θυμ*, water, and *φοβία*, fear, in *Medicine*, an aversion or dread of water; a symptom arising in persons bitten by a mad dog, or other animal.

This disease is also called *rabies canina*. Some have observed that this kind of madness scarcely ever appears in any animals except dogs, foxes, and wolves, unless by contagion.

The marks whereby to know that a dog is mad, are, his neither eating nor drinking, looking sad and sullen, running it any thing in his way, whether man or beast, known or unknown, with a murmuring noise, but without barking, nodding as if he were overpowered with sleep, and endeavouring to hide himself. These are the symptoms, according to Boerhaave, in the first stage of madness, when a bite, though dangerous, is less malignant than in the next stage, when he begins to pant, hangs out his tongue to discharge a great quantity of froth from his mouth, which he keeps always open; alternately walking slowly and running; his eyes are dull and red, and full of tears; his tongue is of a leaden colour; he becomes faint and weak, falling down and rising up, and attempting to fly at every thing; and then he becomes soot and furious; this stage seldom continues thirty hours, when death terminates the disease, and a bite received now is reckoned incurable. In the first stage Boerhaave says, that he remembers and respects his master, but forgets him in the second stage. Other symptoms of madness are the dog's being avoided by other dogs that smell him, their running away with horror, and the tone of his voice when he barks, which is hoarse and hollow. This disease is most common after long dry hot seasons; and such dogs as live upon stinking carrion, without having sufficient water, are most liable to it.

Baldus, a famous lawyer, died of the *hydrophobia* four months after his being bit in the lip by a little dog. And the same is said of Diogenes the Cynic.

Though the term *hydrophobia* in *Medicine* only denotes this one symptom of dreadful water, yet it is frequently applied to the whole disease consequent on such a bite, with all its symptoms.

The history of this horrible disease, as given by Celsus, Aurelianus, Dr. Mead, Etmüller, Lister, &c. is as follows: the bite of a mad dog is attended with this surprising circumstance, that its effects frequently do not discover themselves till after the cause is forgot; the wound itself closing and healing like any other common wound. But some time after direful symptoms ensue; usually they commence in about forty days, sometimes in six, sometimes not till six months, and sometimes not till a year, or even two years. However, it is no sign of the disorder manifests itself in about six weeks, the patient is commonly concluded to be cured. The first thing observed, is a wandering pain, resembling the rheumatism throughout the whole body, especially about the wounded part, which begins to swell, throb, and discharge an ichor; the patient grows restless, drowsy, and melancholy, and very prone to express complaints of every thing, as the ambient air, the furniture of his bed-chamber, &c. His limbs are stiffened, and succeeded by convulsive agitations, which are sometimes complained of in the eyes, and nostrils, the countenance sorrowful, the face pale and contracted; sweat breaks out about the temples; an unusual flow of saliva at length comes on with a stings of the fauces, a fulness of the tongue, and sometimes frothy breath. From the beginning there is a peculiar bristling and hairiness

viscera in the breast, a struggling for breath, a sighing, nausea and vomiting. The pulse of the patient intermits, and sometimes of a tremor is observed, with convulsions of the nerves and tendons; along with these he feels an inward heat and thirst, which himself becomes continual, the mind is more disturbed, and a delirium approaches: at last the grand symptom appears which denominates the disease, viz. the aqueous pavor, or dread of water, so that he cannot bear so much as the sight of any liquid, without the utmost consternation; much less can he swallow the smallest drop. At first a constriction of the gullet is perceived; spasms are produced by the sight of liquors; and when the surface of any liquid is touched, a strangulation may be felt in the throat, the stomach is inflated, the larynx is outwardly swelled which rises suddenly, and is suddenly fall. *London Medical Obs. vol. v. p. 195, and App.*

This is the pathognomonic sign of the disease's being come to its height; and never happens till two or three days before the patient's death, the disease being then, by the unanimous consent, both of ancient and modern physicians, absolutely incurable.

With this there are other concomitant symptoms; he foams at the mouth, his eyes stare, he cannot swallow his spittle without pain; and his penis is constantly erected, attended with involuntary emissions of semen and frequent calls to urinate water; some bark and snarl like dogs; and actually fancy themselves transformed into those creatures; and in the height of their madness, are ready to fly upon, and tear to pieces the bystanders: yet it is observed, that in the intervals of reason, the patient is afraid of doing harm, and warns those that are about him of their danger. Palanius observes, that the *hydrophobus* patient cannot bear to look in a glass, or any transparent body; and adds, that he never recovers, unless he knows himself in a glass; this being a sign that the poison has not laid hold of the vital parts. Towards the last stage of the disease, these several symptoms increase: strength fails, cold sweats come on, the tightness of the breast increases, and the patient soon expires in spasm.

An absolute bite or wound is not at all necessary to produce this terrible disease: the saliva of a mad dog, &c. being able to convey the disease by mere contact, or application to the skin.

For the nature and cause of the *hydrophobia*; Dr. Mead, from several histories of particular cases, concludes, that it is the effect of a particular kind of inflammation in the blood, accompanied with so great a tension and dryness of the nervous membranes, and such an elasticity and force of the fluid with which they are filled, that the most common representations are made to the mind with too great effect; so that the usual impressions on the organs cannot be suffered. Hence that timorosity, unaccountable anxiety and inquietude, which are always the forerunners of the dread of liquids; as also the pain often felt in making water; and the strange aversions sometimes found in patients at the sight of any thing white, the retina being hurt and grieved by the lively impressions of that colour thereon. Nor is it hard to conceive; that when the saliva is hot, and the throat inflamed and dry, the swallowing of drink should cause such an intolerable agony.

M. Tassery, from a nice dissection and examen of the parts of a person who died of this disorder, conjectures that the Glands and bile are the fluids first infected; and that the patient vomiting a mixture hereof, the throat becomes excoriated thereby; and hence that horror for all foods; and particularly for fluids, because these dissolve those greivous salts contained in the saliva and bile. He adds, that the nature of the poison is such, as dissolves the balsamic and nutritious part of the blood, whence the veins are dried up, so as not easily to admit any blood from the arteries; and the arterial blood by this means sustaining the action and impression of its vessels for so long a time, is still farther dissolved, attenuated, and spiritualized; and thus sent, in too great quantity, and with too great repulsion to the brain; whence those convulsions, distractions, &c.

As to the cure of the *hydrophobia*, Dr. Mead, after Galeo, recommends in this as in other venomous cases, to enlarge the wound, made by the bite, by a circular incision, to apply a caustic to it, and to keep it open for at least forty days. But if this method seem too cruel, it may suffice to extract the poison by clapping a cupping-glass on the place, having first made a deep incision. The doctor adds, he has known a person fresh-bitten, happily saved by the sole application of the unguentum *Alexipharmacum* made exceedingly hot.

If these external precautions have not been used, or not in time, recourse must be had to internal remedies; alexipharmics must be drank; amongst which the others

of river lobsters, or cray-fish, are principally extolled by all the ancient physicians; so that Galen affirms, nobody had ever died who used this remedy. These should be taken to the quantity of one or two poundals every day for forty days successively, either alone or with gession root and frankincense, in wine.

But the frequent and sudden plunging of the patient over head and ears in the sea-water after the bite, has been generally reckoned the best and surest preservative against this disease, without sufficient reason. See *MADNESS*.

Zinnler recommends cordials and alexipharmics, but all in a double dose, and long continued; and gassack, rue, and salt to be beat together, and applied in form of a cataplasm over the wound. Purgings with heliobore and mercurius dulcis is also good; and cantharides are a sort of specific. Scarcifying is commended; and after the scarification, an oxen roasted under the arse is to be applied. But the surest remedy, he adds, is burning the place affected with a red-hot iron, which effectually removes all the malignity. If the physician be not called till late, a cupping-glass is to be applied very hot; an issue near the place may likewise be of service. Sir Theodoric Mayerne gives the following prescriptions for the bite of a mad-dog; pluck the feathers from the breech of an old cock, and apply it bare to the bite; if the dog were mad, the cock will swell and die, and the person bitten will do well; if the cock dies not, it is a proof the dog was not mad. *Philosoph. Trans. No 101.*

The members of the Royal Academy of Sciences furnish us with various instances of persons cured of the disease by various means. M. Pezani mentions a woman perfectly recovered by bleeding her to disquietum, binding her in a chair for a year and feeding her all the time with bread and water. M. Berger relates, that, of several persons bitten, two were cured by bleeding them in the forehead. M. de Hamel adds, that he has known salt-water applied on the wound, effect a cure. Divers cases are produced of those cured of the aqueous pavor, by being overwhelmed with a great quantity of water; and one by being only tied to a tree, and two hundred pails of water thrown on him. But the best instance is that of M. Moirin: a maid of twenty years of age, having all the symptoms, was bathed in a tub of river-water, wherein a tubful of salt had been dissolved. They plunged her in naked again and again, till harrassed almost to death, they then left her sitting in it quite senseless. When she came to herself, she was surpris'd to find herself looking at the water without any concern. *Histoire de l'Acad. an. 1709.*

Vinegar is recommended by Dr. Kramer as a specific against the *hydrophobia*, especially if some powder of cantharides is mixed with it. The receipt given by him is, to boil from four to ten grains of the true powder of cantharides in an ounce and an half, or two ounces of the best vinegar; which is to be given warm to the patient. *Commerc. Norimb. 1735, hebdom. 113.*

The *hydrophobia* appears to be a disorder primarily and principally nervous, from the flying pains, the tightness of the præcordia, the difficulty of swallowing, the horror on approach of water, the great sensibility discovered on the impression of air, &c. and other symptoms that attend it. Boerhaave and Mead apprehend, that the poison is conveyed into the constitution by means of the nervous fluid; but Dr. James, in his *Treatise on Canine Madness*, more rationally supposes that the cellular membrane is the receptacle of this as well as some other infections, which may be conveyed to the blood by those absorbing vessels, which are distributed to every part of the body, and preserve a constant communication between the cellular membrane and blood-vessels. The cure of this dreadful disease has been commonly attempted by such means as destroy nervous or spasmodic irritation, or that peculiar acrimony that occasions the disorder. Opium, musk, mercury, the warm bath, &c. have been prescribed for this purpose.

For an account of various medicines, and the method of treatment recommended in this disorder, see the article *MADNESS*, from the bite of animals.

The *hydrophobia* is a symptom in some levers, and particularly inflammations, &c.

HYDROPHORIA, formed of *Hydro*, water, and *phoria*, I bear, in *Antiquity*, a feast or funeral ceremony, held among the Athenians, and people of *Aegina*, in memory of those who perished in the deluge of Deucalion and Ogyges.

HYDROPHthalmia, a name by which some have called the *prolapsus oculi*, when owing to a quantity of aqueous humours.

HYDROPHYLACIA, of *Hydro* and *phylacia*, I keep; a word used by Kircher, and some others who have written in the

the same system, to express those great reservoirs of water which he places in the Alps, and other mountains, for the supply of the rivers which run through the several lower countries. This he makes to be one of the great uses of mountains in the oeconomy of the universe.

HYDROPHYLLUM, in Botany, see *Water LEAF*.

HYDROPHYSOCLE, formed of *hydro*, water, and *physis*, I cause flatulency, and *ocle*, rupture, a term used by some authors for a sort of hernia, or rupture, occasioned by a mixture of water and flatulencies.

HYDROPIA, *Hydropic*, formed of *hydro*, water, and *pi*, face; a tropical patient, of a petum swelled and bloated with the abundance of water.

HYDROPIPER, in Botany, see *PERICARIA*.

HYDRONEUMOSARCA, a word used by some writers in surgery, to express a tumor filled partly with water, partly with flatulencies, and partly with flesh.

HYDROPS, *Hydro*, of *water*, and *ops*, swelling, in Medicine, see *DROPSY*.

HYDROPS ad matulam, a term sometimes used for a *DIABETES*.

HYDROPOTA, of *Hydro*, formed of *hydro*, water, and *pot*, drinker, of *water*, I drink, in Medicine, a person who drinks nothing but water.

It has long been controverted among physicians, whether or no the *hydroptes* lived longer than other persons? See *DRINK*.

HYDROPYRETOIS, formed of *hydro*, water, and *pyretos*, fever, a word used by some authors to express a malignant fever, attended with very copious sweats. Some make it the same with the *febris Anglicus*, or *SWEATING SICKNESS*.

HYDRORHODINON, formed of *hydro*, water, and *rhodon*, rose, a name given by the ancients to a mixture of water and oil of roses; this, as it was at once cooling and emetic, was very much used by the ancients, to provoke vomiting after the taking of poisons.

HYDROSOTATON, in the writings of the ancient physicians, a name given to a drink made of water, honey, and the juice of roses. The proportions were four pounds of roses, five pints of water, and two pints of honey.

HYDROSARCA, of *hydro*, water, and *sarx*, flesh, in the writers of surgery, a word used to express a tumor, composed partly of water, and partly of flesh.

HYDROSCOPE, *Hydro*, water, and *scopos*, and *scopus*, I consider; an instrument anciently used for the measuring of time.

The *hydroscope* was a kind of water-clock, consisting of a cylindrical tube, conical at bottom; the cylinder was graduated, or marked out with divisions, to which the top of the water becoming successively contiguous, as it trickled out of the vertex of the cone, pointed out the hour.

Synopsus describes the *hydroscope* at large in one of his letters. See *CLIPSYDRA*.

HYDROSELINUM, in Botany, a name given by some authors to *SMALLAGE*.

HYDROSTATICAL Balance, a kind of balance contrived for the easy and exact finding the specific GRAVITIES of bodies, both liquid and solid.

The instrument is of considerable use in estimating the degree of purity of bodies of all kinds; the quality and richness of metals, ores, minerals, &c. the proportions in any mixture, adulteration, or the like; of all which the specific weight is the only adequate test.

The *hydrostatical* balance is founded on this theorem of Archimedes, that a body heavier than water weighs less in water than in air, by the weight of as much water as is equal to it in bulk. Whence, if we subtract the weight of the body in water from its weight in air, the difference gives the weight of as much water as is equal in magnitude to the solid proposed.

Having, therefore, two bodies, the one firm, the other fluid, together with the weight of each apart; to find their proportion, divide the greater by the lesser; the quotient compared to one, that is, unity, will be the antecedent of the proportion desired.

The instrument, with its apparatus, is represented *Tab. IV. fig. 43 and 44. Hydrostatics and Hydraulics*, and needs little description. See *GOULD*.

AB is a nice balance, turning with a small part of a grain, and furnished with a long examen D, for determining the exact horizontal position of the balance.

1. To find the specific gravity of a fluid: hang in the end B of the beam the little scale S, and to the bottom of the scale S, by a horse-hair, which is of the same specific gravity with water, the glass bubble G, which must be specifically heavier than any fluid except mercury. To the opposite end A of the beam hang a brass scale E, which is a counterpoise to the bubble G immersed in water; but when the bubble hangs out of the

water, a weight must be laid on E to keep it in equilibrium, which weight will be equal to what the bubble lost in water, or to a bulk of water equal to the bubble; when rain water is used, this weight will be a thousand grains. Then fill a cylindrical vessel I, about two thirds with common water; and when the bubble is let into it, the beam will remain in a horizontal position, if the water be of the same specific gravity as that in which the bubble was adjusted; if it be not, there will be a variation, which is to be corrected by means of little weights for that purpose. Having thus adjusted the bubble in water, the specific gravity of any other fluid will be found by weighing the bubble in it; and since you always weigh so much of the liquid as is equal to the bulk of the bubble, if there be any difference between such quantity and the like quantity of water, it will be discovered by putting weights into the ascending scale. E. g. if red Port wine be put into the vessel I, the bubble will sink and require the addition of ten grains in the scale E, when the balance has been adjusted in rain water, for restoring the equilibrium; which shews that Port wine is lighter than rain water ten parts in a thousand, or one hundredth part. If proof brandy be used, seventy-seven grains will be required to restore the equilibrium, and therefore brandy, or proof spirits, weighs seventy-seven parts in a thousand, or one thirtieth part less than rain water. But in a denser medium G would rise; and if sea water be used, twenty-six grains must be put into the scale S to restore the equilibrium, which shews that sea water is twenty-six parts in one thousand, or one thirty eighth part, heavier than rain water.

2. To find the specific weight of a solid: instead of the bubble, hang on the glass bucket K, *fig. 44*, which, with its suspending piece H, will be in equilibrium with the counterpoising scale E. Having weighed the solid in air in the bucket, by counterpoising it with weights on the scale E, note its weight; but because not only the solid to be tried, but the glass bucket itself will lose of its weight when immersed in water, you must restore to the bucket the weight that it loses by being immersed, that the body in it alone may be examined: this is done by means of the piece F, which weighs just as much as a bulk of water equal to the bucket; and being slipped on the suspending piece at H, it not only restores to the bucket what it had lost by being immersed in water, but makes a scale for receiving weights, in order to restore the equilibrium to the solid contained in the bucket, and to shew how much it has lost of its weight in water. When many bodies are to be weighed *hydrostatically*, it is best to weigh them all in the air successively, and set down their weights before you begin to weigh them in water, because it would be troublesome to dry the bucket every time. Care must also be taken that no bubbles of air adhere to the bodies weighed in water, which would make them lighter.

Dr. Delagualiers has added a contrivance to this machine to make it more nice, see *figs. 45, S, S*, are three screws which serve to set the foot and then upright; and OM is a string and plummet, whose point hanging over M, shews when the piece PC is truly vertical. There is also a piece EO, which has a slit to compare with the examen D playing in the notches C e. *Delag. Exp. Phil. vol. ii. p. 196*.

Mr. Martin proposes the following construction of an accurate *hydrostatical* balance. A B, *fig. 46*, is the foot on which it stands; C D, a pillar supporting a moveable brass plate E F, fastened thereto by the screw in the knob A. In the end of this plate is fixed an upright piece I K, supporting another plate G H, which slides backwards and forwards thereon, and is moveable every way about it. In the end of this plate W, H, is fixed (by a nut beneath) a wire L M, taped with a fine thread from one end to the other; upon this moves the swan-neck slip of brass N O, to which a very exact balance is hung at the point N, to one of whose scales P is appended the heavy body R, by a fine horse-hair or piece of silk S; the weight of the said body R in the air is expressed by the weights put into the scale Q; to have an equilibrium therewith, which being destroyed by immersing the solid in the fluid T V, contained in the vessel W V, is again restored by weights put into the scale Q. So that the weights in the scale Q compared with them in the scale P, shew at once the specific gravity of the solid R to that of the fluid T V.

For several other constructions of this instrument, designed for greater accuracy than that of the common sort, the reader may consult *Gravitationis Principia Elem. Math. & com. l. lib. 3. cap. 3*. The specific gravities of small weights may be determined by suspending them in loops of horse hair, or silk threads, to a hook at the bottom of the scale of the common *hydrostatical* balance. E. g. if a guinea suspended in air be counterbalanced

by 129 grains in the opposite scale; and upon being immersed in water, requires 77 grains to be put into the scale over it, in order to restore the equilibrium; we thus find that a quantity of water of equal bulk with the guinea, weighs $7\frac{1}{2}$ grains, or 7.25 ; by which divide 129, the weight of the guinea in air, and the quotient, or 17.793, shews that the guinea is 10 many times heavier than its bulk of water. Whence, if any piece of gold be tried, by weighing it first in air, then in water, and if upon dividing the weight in air by the loss in water, the quotient is 17.793, the gold is good; if the quotient be 18, or between 18 or 19, the gold is very fine; but if it be less than 17 $\frac{1}{2}$, the gold is too much alloyed with other metal. If silver be tried in this manner, and found to be eleven times heavier than water, it is very fine; if it be 104 times heavier it is standard; but if it be any less weight compared with water, it is mixed with some lighter metal, such as tin. In order to find the specific gravities of those bodies that are lighter than water, let an upright fluid be fixed into a thick flat piece of brass, and in this fluid let a small lever, whose arms are equally long, turn upon a fine pin as an axis. Let the thread which hangs from the scale of the balance be tied to one end of the lever, and a thread from the body to be weighed, tied to the other end. This done, put the brass and lever into a vessel; then pour water into the vessel, and the body will rise and float upon it, and draw down the end of the balance from which it hangs, then put as much weight in the opposite scale as will raise that end of the balance, so as to pull the body down into the water by means of the lever; and this weight in the scale will shew how much the body is lighter than its bulk of water. Ferguson's Lects. p. 166, 8vo.

HYDROSTATIC Bellows, in *Hydraulics*, is a machine for demonstrating the upward pressure of FLUIDS, consisting of two thick oval boards A, (Tab. IV. *Hydraulics*, Sec. fig. 47,) about sixteen inches broad, and eighteen inches long, covered with leather, to open and shut like a common bellows, but without valves, only a pipe B, about three feet high, is fixed into the bellows at c; let water be poured into the pipe at C, which will run into the bellows, and separate the boards a little. Then lay three weights W, R, S , each weighing a hundred pounds upon the upper board; and pour more water into the pipe B, which will run into the bellows, and raise up the board with all the weights upon it; and if the pipe be kept full until the weights are raised as high as the leather, which covers the bellows, will allow, the water will remain in the pipe, and support all the weights upon it; even though it should weigh no more than a quarter of a pound, and these three hundred pounds; nor will all their force be able to cause them to descend and force the water out of the top of the pipe. The reason of this will appear, if we consider that if a hole be made in the upper board, and a tube be put into it, the water will rise in the tube to the same height as it rises in the pipe; and would rise as high by supplying the pipe in as many tubes as the board could contain holes. Now, suppose only one hole to be made in any part of the board, of an equal diameter with the bore of the pipe B, and that the pipe holds just a quarter of a pound of water; if a person puts his finger upon the hole, and the pipe be filled with water, he will find his finger to be pressed upward with a force equal to that of a quarter of a pound. As the same pressure is equal upon all equal parts of the board, each part, whose area is equal to the area of the hole, will be pushed upward, with a force equal to that of a quarter of a pound; the sum of all which pressures against the under side of an oval board, sixteen inches broad, and eighteen inches long, will amount to three hundred pounds; and, therefore, so much weight will be raised up and supported by a quarter of a pound of water in the pipe. Hence if a man stands upon the upper board, and blows into the bellows through the pipe B, he will raise himself upon the board; and the smaller the bore of the pipe is, the easier he will be able to raise himself; and then by putting his finger upon the top of the pipe, he can support himself as long as he pleases; provided that the bellows be air-tight. Mr. Ferguson has described another machine, which may be substituted instead of this common *hydrostatic bellows*; ABCD, fig. 48, is an oblong square box, in one end of which is a round groove, as at a, from top to bottom, for receiving the upright glass tube I, which is bent to a right angle at the lower end as at i, in fig. 49. and to that part is tied the end of a large bladder K, which lies in the bottom of the box. Over this bladder is laid the moveable board L, fig. 48. and 50. in which is fixed an upright wire M; and leaden weights N N, to the amount of sixteen pounds, with holes in their

middle, are put upon the wire over the board, and press upon it with all their force. The cross bar p is then put on to secure the tube from falling; and keep it in an upright position; and then the piece EFG is to be put on, the part G sliding tight into the dove-tailed groove H, to keep the weights N N horizontal, and the wire M upright, which is received into a round hole q, in the part EF. There are four upright pins in the four corners of the box within, each almost an inch long, for the board L to rest upon, in order to keep it from pressing the sides of the bladder below it close together at first. The whole machine being thus put together; pour water into the tube at top, and the water will run down the tube into the bladder below the board, and after the bladder has been filled up to the board, continue pouring water into the tube, and the upward pressure of the bladder will raise the board with all the weight upon it, even though the bore of the tube should be so small, that less than an ounce of water would fill it. Ferguson's Lectures, Supplement 1767, p. 16.

Bradford's HYDROSTATICAL Instrument, is a new invention for weighing money, and discovering in defect either of weight or purity.

It consists of a thin flat brass ruler, about half a foot long, on each side of which are two graduated lines, those on the upper side marked A and W (see Tab. IV. *Hydraulics*, fig. 51. N^o 1.) and those on the other side B and W, *ibid.* N^o 2. There are also a small chain and pincers, wherein to fix the piece of money intended to be weighed and proved, together with two pair of centre pins, marked A and B, *ibid.* N^o 3. and 5, being the points of suspension of the rod when used; whereas the former pair A are to be used for proving all pieces of gold under thirty-six shillings value; and the other pair, marked B, for all pieces from thirty-six shillings to twenty-two shillings, or three pounds twelve shillings. Lastly, there is a sliding piece, or index C, *ibid.* N^o 3. by the motion of which backward or forward until the point of equilibrium is discovered, the value of any piece suspended in the pincers is found upon the graduated lines already mentioned. Of these lines those marked A and B are called *statical lines*, as being calculated for weighing the piece in air; and those marked W W, are called *hydrostatical lines*, as serving to point out the alloy or adulteration of the piece weighed. A whole division on each line is equal to the weight or value of one shilling in gold; a half division to six pence, and a quarter division to three pence.

To prove a guinea: first suspend it in the pincers, and then placing the inside of the sliding piece C to twenty-one on the line A on the upper side of the ruler, which must move freely on the centre pin marked A, and if the guinea and sliding piece exactly balance each other, the guinea is full weight; if not move the slider backwards or forwards until they equiperiodate; when the division cut by the inside of the slider is the true weight of the gold; and if it rests for instance, at twenty and a half, then the guinea weighs only twenty shillings and six pence. In the next place, to prove the alloy of this piece, let the slider be brought to the division twenty and a half, upon the *hydrostatical* line marked W, for whatever division is cut by the slider in weighing on the *statical* line, it must be placed at the same on the *hydrostatical* line adjoining. Then let the piece, together with the pincers, and the brass link whereon it is suspended, be immersed in water (*ibid.* N^o 3.) as far as the notch on the said link; if then the instrument acts in equilibrium, or the piece sink deeper in the water, the guinea is standard gold; but if the slider must be moved further backward before it will equiperiodate, the guinea is adulterated. If it is alloyed with silver, allow two shillings for every penny it wants in the *hydrostatical* weight; and then if the number of pence the piece is deficient in weight *hydrostatically*, when doubled, exceed the number of shillings it weighs *statically*, it may be concluded to be adulterated with some baser metal than silver. However, a more speedy method of discovering whether a piece of gold be adulterated or not, without moving the slider more than once, is this: when the piece is weighed *statically*, bring the slider to the division on the *hydrostatical* line expressing its weight; and immersing the piece and pincers as before, so that the surface of the water may be exactly at the mark on the long link, if the instrument does not then equiperiodate, gently lower the hand that holds the fluid, until the instrument comes to an equilibrium; at which time, if the guinea be a counterfeit, great part of the pincers will appear above the water; if a 36s. piece be tried, not only the pincers, but a small part of the coin, will appear above the surface, if the piece be counterfeit. This last method is sufficiently near the truth for common practice.

If there is occasion to weigh and prove a very small piece

Or thus: provide two wooden frames, AB and CD, fig. 34.) with grooves therein; and between those grooves fit two thin leaves of ash, A&F C, and GBDH, so as they may easily slide either way. At the extremes of the frames, A, B, C, D, confine the leaves with nails, leaving between them the space EGHR, about an inch wide. On I, fasten a slip of brass dented, IK; and in L a little dented wheel, upon whose axis, on the other side of the machine, an index is to be put. Lastly, from the centre of the axis, on the same side, draw a circle, and divide it into any number of equal parts.

Now, it being found by experience, that altho wood readily imbibes the moisture of the air, and swells thereby; and as that moisture dries, shrinks again; upon any increase of the moisture of the air, the two leaves AF and BH, growing tight, will approach nearer each other; and, again, as the moisture abates they will shrink, and again recede. Hence, as the distance of the leaves can neither be increased nor diminished without turning the wheel I, the index will point out the changes in respect of humidity and dryness.

It is to be noted, that all the hygrometers above described become sensibly less and less accurate; and, at length, undergo no sensible alteration at all from the humidity of the air. The following is much more lasting; though no hygrometer will serve for years, like a barometer and thermometer; but whatever be the substance of which it is made, will be so altered as to become in a great degree useless.

Take the MANISCOTTA described under that article, and instead of the exhausted ball E, (fig. 35.) substitute a sponge, or other body, which easily imbibes moisture. To prepare the sponge, it may be necessary first to wash it in water; and when dry again, in water or vinegar, wherein sal ammoniac, or salt of tartar, has been dissolved, and let it dry again.

Now, if the air become moist, the sponge growing heavier, will preponderate; if dry, the sponge will be hoisted up, and, consequently, the index will shew the increase or decrease of humidity of the air.

In the last mentioned hygrometer, Mr. Gould, in the Philosophical Transactions, instead of a sponge, recommends oil of vitriol, which is found to grow sensibly lighter or heavier, in proportion to the lesser or greater quantity of moisture it imbibes from the air; so that being fastened in the moistest weather, it afterwards retains or loses its acquired weight, as the air proves more or less moist. The alteration in this liquor is so great, that in the space of fifty-seven days it has been known to change its weight from three drachms to nine; and has shifted an index or tongue of a balance thirty degrees. A single grain, after its full increase, has varied its equilibrium so sensibly, that the tongue of a balance, only an inch and half long, has described an arch one-third of an inch in compass; which arch would have been almost three inches, if the tongue had been one foot, even with so small a quantity of liquor; consequently, if more liquor, expanded under a large surface, were used, a pair of scales might afford as nice an hygrometer as any kind yet invented. The same author suggests, that oil of sulphur per campanum, or oil of tartar per deliquium, or the liquor of fixed nitre, might be substituted in lieu of the oil of vitriol.

This balance may be contrived two ways; by either having the pin in the middle of the beam, with a slender tongue, a foot and half long, pointing to the divisions on an arched plate, as represented in fig. 35.

Or, the scale with the liquor may be hung to the point of the beam near the pin, and the other extreme be made so long, as to describe a large arch on a board placed for the purpose, as represented in fig. 36.

Mr. Anderson has proposed some amendment in the sponge hygrometer. He directs the sponge A (fig. 37.) to be so cut, as to contain as large a superficies as possible; and to hang by a fine thread of silk, upon the beam of a balance B, and exactly balanced on the other side by another thread of silk at D, strung with the smallest lead-shot, at equal distances, so adjusted, as to cause an index, E, to point at G, the middle of a graduated arch, FGH, when the air is in a middle state, between the greatest moisture and the greatest dryness. Under this silk so strung with shot, is placed a little table or shelf, I, for that part of the silk and that, which is not suspended, to rest upon. When the moisture imbibed by the sponge increases its weight, it will raise the index, and also part of the shot, from the table, and vice versa, when the air is dry. Phil. Trans. N° 479, vol. xlv. p. 66.

From a series of hygroscopical observations, made with an apparatus of deal wood, described in the Philosophical Transactions, N° 480. Mr. Conner concludes, 1. That the wood shrinks most in summer, and swells most in winter, but is most liable to change at spring and fall,

2. That this motion happens chiefly in the day-time, there being scarce any variation in the night. 3. That there is a motion even in dry weather, the wood swelling in the morning, and shrinking in the afternoon. 4. The wood, by night as well as day, usually shrinks when the wind is in the north, north-east, and east, both in winter and summer. 5. That by constant observation of the motion and rest of the wood, with the help of a thermometer, one may tell the situation of the wind without a weather-cock.

He adds, that the time of the year may be known by it; for in spring it moves quicker and more than in winter; in summer it is more stilted than in spring; and has less motion in autumn than in summer.

See an account of the method of constructing these and other hygrometers in Lowthorp's *Mining*, Phil. Trans. vol. ii. p. 303, &c. and plate 1. annexed. See also Phil. Trans. vol. xliii. N° 473, p. 6, &c. vol. xlv. p. 169, and p. 184.

Dr. Hooke's hygrometer was made of the beard of a wild oat, set in a small box, with a dial-plate and an index. See his *Micrographia*, p. 150, &c.

An hygrometer of this kind may be constructed in the following manner. Let ABCD (fig. 38.) be a square brass plate, about four inches square, with a ring or circle fixed to it, graduated on the flat and the inner edge. IC represents a very light index of brass or steel, with a small cylindric lump in its centre, into which is fastened the top of the beard of a wild oat, by a little peg, and the other end of it is in another lump, about an inch under the plate, which, having a little hole under C, allows the beard of the oat to come through, in order to carry the hand, and yet keep it in its place, without hindering it to twist and untwist. There are also two wires coming down under the middle of the plate, which hold a little cross-bar, making a small frame to carry the lump that holds the bottom of the beard exposed to the air. The four feet of this instrument, two of which are feet at C, D, must be about one inch and a quarter long, to keep the frame under the plate from touching any thing which the instrument is set upon. AB, in fig. 39, represents the plate, F and E two of its feet. CA and D the little lumps to which the wild oat-beard, CD, is fastened; cf and pd the wires supporting the piece of fb, and all together form an open frame, to hold the lump D. The beard passes through the hole i, in order to carry the index I, which points to the degrees on the graduated circle AB.

The following hygrometer was contrived by doctors Hales and Delagualiers. P & W C, (fig. 40.) is a piece of lig-num vitæ, cylindric at C w p, but from C w to p a truncated cone, and screwed like the fuzee of a watch; but not so taper. The length of the instrument is about a foot, the cylindric part an inch in diameter, and half an inch long; the large part of the screw about three quarters of an inch, and the small part half an inch; at each end there are fine steel pivots, bearing on two fine conic holes in brasses in the frame that carries the instrument, that it may turn easily. A sponge, S, hangs by a silk from the cylinder of the instrument, so as to turn by its rising or falling; a weight W, hanging from another silk s, coiled upon the screw C p, keeps the sponge in equilibrium. When the sponge becomes heavier, by imbibing moisture from the air, it runs down, and draws up W; but as W comes up, its string must advance towards C w, where, hanging farther from its centre, its power will be so increased, that it will keep the sponge in equilibrium, though its weight be increased. But as the weight rises, it will draw on the scale, DD, how much the sponge is heavier, and consequently the air moister. This instrument will be made still more sensible, when its pivots are supported by four friction wheels. Salt of tartar, or any other salt, or other oil, may be put into the scale of a balance, and used instead of the sponge. Delag. Exp. Phil. vol. ii. p. 303.

In an hygrometer invented and described by Mr. Perpetua, A A A (fig. 41.) is a frame of wainscot or mahogany, grooved in the longest side, to hold the panel BBB of white deal board, without pinning it. The panel is about the thickness of a crown-piece, and fifteen inches long cross-wise to the grain of the wood. The middle part projects at C and C, where it is fastened into the frame by two screws; so that this part always remains in the same place, whilst the rest of the panel expands by moist air towards both ends of the frame, and contracts towards the middle, when the air is dry. To a pin at F is fastened one end of a small flexible cord DE, and the other end goes round the pulley G, and is fixed into the bottom of its groove at H. One end of another small cord, I K, is fixed into the groove of the large pulley, H, at a going round the part L M, and passing round to M, round a small pulley L, the rest of which

which turns in the piece O, lying above it, and screwed to the frame at C. To the end of the cord is suspended a flatfish weight N. The diameters of the pulleys, G and L, are equal, and about one-tenth of the diameter of H. The distance of the pulleys, G, and pin F, will determine the expansion of the panel between F and G; which will cause the pulley, G, to turn backward, and any point in H ten times as much; and in this proportion will the weight N be raised: therefore if the panel extend one-tenth of an inch by moist air, the pulley L will be turned quite round. As the air grows dry, the panel contracts, the weight N descends, and turns all the pulleys the contrary way. The back of the plate A A, (fig. 42.) is screwed to the other side of the frame, so that the front edge of the plate may be even with the uppermost side of the frame, and the centre B may be directly over the centre of the pulley L. (fig. 41.) on whose axis the index B C (fig. 42.) is fixed, which, by moving on the graduated edge of the plate, indicates the moisture or dryness of the air. The panel should be changed in three or four years. Phil. Trans. vol. liv. art. 47.

Mr. Smooton's hygrometer is exhibited in fig. 43. and fig. 44. ABC (fig. 43.) is an orthographic delineation of the whole instrument seen in front, with the box-cover H, which defends the index, &c. from injury, and by a glass exposes the scale to view. FG in both figures represents a flaxen cord, about thirty-five inches long, suspended by the turning peg F, attached to a loop of brass wire at A. This cord is that which is called by net-makers in London *flaxen three-threads laid*, and is between one-twentieth and one-thirtieth of an inch in diameter. It is previously boiled in a solution of two penny-weights Troy of common salt in one pound avoirdupois of water, boiled till the whole is reduced to six ounces avoirdupois. The cord soaked in this brine is dried, and then stretched, by tying three or four yards of it to two nails against a wall, in a horizontal position, and hanging a weight of a pound or two to the middle. When it has remained in this position for a week or more in a room, it will be fit for use. G, I, (fig. 44.) are two loops; or long links of brass wire, lying hold of the index KL, which is moveable on a small stud or centre, K. The cord FG is kept moderately strained by a weight M, about half a pound avoirdupois. As the cord lengthens or shortens, the end of the index passes over the scale NQ, disposed in the arc of a circle, and containing a hundred equal divisions. This scale is attached to the brass sliding ruler QP, which moves upon the directing piece RR, fixed by screws to the board, which makes the frame or base of the whole; and the scale and ruler, NOP, are retained in any place nearer to or farther from the centre K, by the screw S. Fig. 45. represents in profile the sliding-piece and stud I, which traverses on that part of the index next the centre K; and which can, by the two screws of the stud, be retained upon any part of the index that is made parallel, and which is done for three or four inches from the centre, for that purpose. The stud is filed to the edges like the fulcrum of a scale-beam, one being formed on the under-side, and the other upon the upper, as near as possible to one another. A hook, formed at the lower end of the wire loops, G, I, retains the index by the lowermost end of the stud, while the weight M hangs by a small hook upon the upper edge. By these means the index is kept steady, and the cords strained by the weight, with very little friction or burthen upon the central stud K. Fig. 46. is a parallelogram of plate brass, to keep out dust, which is attached to the upper edge of the box-cover H, and serves to shut the part of the cover, necessarily cut away, to give leave for the wire, G, I, to traverse with the sliding stud (fig. 45.) nearer to or farther from the centre of the index K. In this (fig. 46.) there is a hole a, about one-fifth of an inch diameter, for the wire G, I, to pass through, in the motion of the index, without touching; b is a slit of a lesser size, sufficient for the wire to pass, and allow the cover to come off without disturbing the end of index; c c are two small screws applied to two dies, by which the plate slides lengthways, in order to adapt the hole a to the wire G, I, at any place of the stud I, upon the index KL. This index is twelve inches long, four inches of which, from the extreme end, are filed so narrow, that any part of them may serve for an index to the divisions of the scale; the scale itself also slides four inches. The directing piece, RR, is parallel to a line drawn from o upon the scale to the centre, K, of the index; consequently, as the attenuated part of the index forms a part of a right line drawn from the same centre, whenever the index points to o upon the scale, though the scale be removed nearer to or farther from the centre of the index, yet it produces no change in the place to which the index points. When the divided arc of the scale is at ten inches

from the centre, which is its mean distance, then the centre of the arc and the centre of the index are coincident. At other distances, the extremes of which are eight or twelve inches, the centre of the divisions, and the centre of the index, pointing to them, not being coincident, the index cannot move over spaces geometrically proportionable to one another in all situations of the scale; yet the whole scale not exceeding thirty degrees of a circle, it will be found, on computation, that the error can never be so great as $\frac{1}{11}$ th part of the scale, or one degree of the hygrometer.

For adjusting the instrument, take off the box-cover, and set the instrument nearly upright about a yard from a moderate fire; there let it remain, till the index sinks as low as it will go, striking the cord occasionally between the thumb and finger downwards. When it is become stationary, raise or depress the index by means of the peg at top, till it lies over the point a; then remove the instrument from the fire, and with a camel-hair pencil dipped in warm water, moisten the cord, without suffering any drops of wet to fall from it, till it is saturated, and the index becomes stationary. If the index lies over the degree marked 100, all is right; if not, slack the screw S, and slide the scale nearer to or farther from the centre, till the point 100 comes to the index, and the instrument is adjusted for use. If the compass of the slide be not sufficient to effect this, slack the proper screws, and move the sliding stud i nearer to or farther from the centre of the index, as the angle, formed by the index between the points of dry and wet, happens to be too small or too large for the scale. Mr. Smooton was led by observation to mark the point of o dry, 26° the mean, 40° moist, 70° very moist, and 100° wet. Phil. Trans. vol. li. part 1. art. 24.

The last hygrometer we shall describe is that of M. de Luc. The part of this hygrometer which is affected by the moisture of the air, is a hollow tube of ivory a b, (fig. 47.) two inches eight lines long, and internally two lines and a half in diameter. This tube is open at the end a, and closed at b, terminating in a point; and the thickness of its sides, for the length of two inches six lines from the bottom, is but three-sixteenths of a line: it is this thin part which does the office of an hygrometer; the remaining part of the cylinder, towards its orifice a b, must be kept a little thicker, in order to bear the pressure of a tube of glass, about fourteen inches long, the lower end of which is bent d e c. The internal diameter of this tube is about three-eighths of a line, and the outside diameter about two lines, in order that the part c e of a brass piece f f g g, through which it passes, and which is to enter into the ivory pipe, be as thin as possible. In order to hinder that part of the tube, which incloses the brass piece, from being affected by the variations of moisture, it is covered with a brass rafter h h i i. These pieces are united together with gum lac or mastic, which melts by the heating of the glass and brass. M. de Luc's reason for chusing ivory for his hygrometer is, that this matter appeared to him more proper than any other for receiving the impression of the moisture of the air, without suffering thereby any material change. The cylinder made of it becomes more capacious, in proportion as it grows moister; and this is the fundamental principle of the instrument. M. de Luc has also found, that upon letting this cylinder lie for some time in water of an uniform temperature, it swells to a certain point, after which it dilates no farther. This circumstance furnished him with a maximum of humidity; and, consequently, with one point of comparison in the scale of the hygrometer; and this point he has fixed at the temperature of melting ice. For measuring the differences in the capacity of this ivory cylinder, and thereby discovering its different degrees of moisture, M. de Luc makes use of quicksilver, with which he fills the cylinder, and a part of the communicating glass tube. The more capacious this cylinder is, or, which is the same, the moister it is, the lower does the mercury stand in the glass tube, and vice versa. Now M. de Luc has found, that the lowest point, to which it can sink, is that where it stands when the ivory cylinder is soaked in melting ice; he, therefore, names or gradates this point o in the scale of his hygrometer, and, consequently, the degrees of this scale are degrees of dryness, counted from below upwards, as the quicksilver rises in the glass tube. To give these degrees a determinate length, and thus to render the hygrometer capable of being compared with each other, M. de Luc employs, in constructing them such glass tubes as have been previously prepared, by being made into thermometers, and filled with mercury, so as to ascertain upon them the points of melting ice and boiling water, and to take exactly the distance between these points by any scale at pleasure. When this is done, the bulb of this preparatory thermometer must be broken, and the quick-

filter it contains exactly weighed. It is by knowing the weight of this, together with the distance between the fixed points of the thermometer, that the scale of the *hygrometer* is determined. E. g. Let the weight of the quicksilver be one ounce, and the distance between the above mentioned points one thousand parts of a certain scale; then (suppose that the quicksilver in the *hygrometer*, to which this tube is to be applied, weighs only half an ounce; this will give a fundamental line, consisting of five hundred parts of the same scale. The fundamental line, thus found, is applied to the scale of the *hygrometer*, beginning at 0, and measuring it off about four times over, that the whole variation of the instrument may be comprehended. Each of these spaces being afterwards divided into forty equal parts, gives such degrees as M. de Luc has found most convenient. In general terms, the length of the fundamental line of the *hygrometer* must be to the interval between the two fixed points of the preparatory thermometer, as the weight of the quicksilver in the *hygrometer* is to the weight of the quicksilver in that thermometer. This proportion between the scale of the *hygrometer*, and that of the preparatory thermometer, furnishes an easy method of proceeding in this instrument the effects of heat upon the mercury which it contains. It will easily be conceived, from the construction of the scale of this *hygrometer*, that if its cylinder of ivory was suddenly changed into glass, the instrument would become a true thermometer, in which the interval between the points, answering to melting ice and boiling water, would be divided into forty parts. If, therefore, a thermometer, with a scale similarly divided into forty parts between the fixed points, be placed over the *hygrometer*, it will show immediately the correction to be made on this instrument for its variation as a thermometer, under particular restrictions, which M. de Luc has stated.

That part of the frame of the instrument on which the scale is marked, is moveable; so that, before observing the points at which the mercury stands, it may be pulled upwards or downwards, according as the thermometer has risen or fallen with respect to the point of melting ice; and thus the indications of the *hygrometer* can at once be freed from the errors which would arise from the difference in the volume of the quicksilver, on account of the different degrees of heat.

For this purpose, at the top of this scale, there is an index over- and under another small scale, marked upon the unmovable part of the frame; the degrees of this small scale are eightieth parts of the fundamental line, and answering to the degrees of the thermometer on the same frame. When the index points to 0 of the small scale, the thread which indicates upon the tube of the *hygrometer* the point in which the mercury sank in the melting ice, answers like wife to 0 in the scale of the *hygrometer*. See an elaborate account of the principles and advantages of this *hygrometer*, the particular process of its construction, and observations made with it by M. de Luc, in the Phil. Trans. vol. lxiii. part ii. art. 48.

The instrument, with its frame, is seen in fig. 48. It is mounted on deal, because this wood suffers the least change in the length of its fibres. The lower part of the frame is slit through the whole length of the ivory pipe, in order that the air may circulate freely round this pipe, and the bulb of an annexed thermometer. The *hygrometer* is fastened in three parts, viz. at bottom on a small bracket, at top by a tube passing through a piece either of hard wood or of metal fastened by screws, but chiefly by means of a brass wire on the neck of the brass piece, which unites the glass with the ivory pipe. This piece is laid in a small plate of a hard wood, which in that place fills a groove originally made through the whole length of the board. To prevent dust from getting through the opening of the tube, it is shut up in a small ivory case. The scale of the *hygrometer* is marked upon a deal slip, which slides along the groove just mentioned. This and all the other parts of the frame must be lined with paper, for marking the necessary scales, and this paper is afterwards varnished over. The scale of the *hygrometer* is carried to the proper point, by means of a knob fixed on a small piece of hard wood or metal, screwed to the bottom of the board, and which affords a free passage to the tube of the *hygrometer*.

HYGROPHOBIA, in *Medicine*, is sometimes used in the same sense with **HYDROPHOBIA**.

HYGROSCOPE, compounded of *hygro*, moist, and *scopos*, I observe, or observe, is commonly used in the same sense with **HYGROMETER**.

Wolffius, however, regarding the etymology of the word, makes some difference. According to him, the *hygroscope* only shows the alterations of the air in respect of humidity and dryness; but the *hygrometer* measures them. A *hygroscope*, therefore, is a less accurate hygrometer.

Vol. II. N° 179.

HYIOTES, *Turci, Filistini*. See **ADONION**.

HYKES, a sort of blanket, in great use among the natives of Barbary. They are worn by the women, who make no use of a female thuring, but conduct every thread of the wool with their fingers. One of these *hykes* is usually six yards long, and five or six broad, serving the Kabile as well as Arab, both male and female, for a complete dress in the day, and for his bed and covering in the night. It is a soft and troublesome kind of garment, being frequently disconcerted, and falling on the ground; so that the wearer is every moment to be picking it up, and folding it anew round his body. Dr. Shaw (Trav. p. 286.) takes it to be much the same with the *peplus*, if not with the *toga* of the ancients.

HYLARCHIUS, formed of *hyla*, matter, and *archo*, government, or *tele*, his principle, a word by which some authors express what they call a ruling and presiding spirit, which governs and actuates all matter. See **PLASTIC**.

HYLE, or **HYLES**, from *hyla*, which signifies matter, among *Alchymists* is their first matter; or it is matter considered as produced by nature herself, called also *choyde*.

HYLEG, or **HYLEN**, in *Astronomy*, an Arabic term for a planet, or for a point of the heavens, which in a man's nativity becomes, as is pretended, the modern term significant of life.

HYLEGIAL, *planet*, among *Alchymists*, are those wherein a planet being found, is qualified to have the government of the constituted life.

HYLOISM, or **HYLOBIANA**, compounded of *hyla*, which bet. *hyla*, signifies also matter, for *hyla*, and *hyla*, life, a sect of Indian philosophers, thus denominated by the Greeks because they retired to forests, to be more at leisure for the contemplation of nature.

HYLOPATHIANS, formed of *hyla*, matter, and *pathos*, of *maria*, suffer. See the following article, and **ANAXIMANDRIAN**.

HYLOZOISTS, formed of *hyla*, matter, and *zoa*, life, the name of a sect of ethicists among the ancient Greek philosophers, who held matter to be animated, maintaining that matter had some natural perception, without animal sensation, or reflection in itself considered; but that this imperfect life occasioned, that organization, whence sensation and reflection afterwards arose. Of these, some held only one *hyla*, which they called a *PLASTIC* nature, producing regularly and invariably over the whole corporeal universe, which they represented as a kind of large plant or vegetable; these were called the *cataleptists*, and *hyleists*, because the Stoics held such a nature, though many of them supposed it to be the instrument of the Deity. Others thought that every particle of matter was endued with life, and made the world one system to depend upon a certain mixture of chance and plastic or orderly nature united together. These were called the *Stoicists*, from *Stoia* Lampsacus, a disciple of Thales, called also *Physicus* (Cicero, De Nat. Deor. lib. i. cap. 13.) who was first a celebrated Peripatetic, and afterwards formed this new system of ethics for himself. Besides these two forms of *hylism*, some of the ancient philosophers were *Hylophians*, or *ANAXIMANDRIANS*, deriving all things from *dead* and *sluggish* matter, in the way of qualities and forms, *generable* and *corruptible*, and others again adopted the *ATOMIC* or *Democritean* system, who ascribe the production of the universe to atoms and figures. See on this subject Cudworth's Intellectual System, vol. ii. book i. chap. 3. Birch's edit. 1743.

HYMEN, *Yoon*, in *Anatomy*, a thin membrane or skin, sometimes circular of different breadth, more or less smooth and sometimes semitransparent, formed by the union of the internal membrane of the great cavity with that on the inside of the air, resembling a piece of fine parchment. This membrane is supposed to be stretched in the neck of the womb of virgin, below the symphysis, leaving in some subjects a very small opening, in others a larger, and in all rendering the external orifice narrower than the rest of the cavity, and to be broken when they are delivered; an effusion of blood following the breach.

This membranous circle may hinder the fall of some disorder by too great a flux of the menies, by impudence, levity, and other particular accidents.

The *hymen* is generally looked upon as the seal of virginity; and when broken or withdrawn, shows that the person is not in a state of innocence. This notion is very ancient. Among the Hebrews, it was the custom, for the parents to save the blood shed on this occasion, as a token of the virginity of their daughter, and to send the sheen next day to the husband's relations. And the like is said to be still practised in Portugal, and some other countries.

And yet authors are not agreed as to the existence of such a membrane. Nothing, Dr. Drake observes, has employed

H Y M

played the curiosity of anatomists, in dissecting the organs of generation in women, more than this part: they have differed not only as to its figure, substance, place, and perforation, but even its reality; some positively affirming, and others stoutly denying it.

De Graaf himself, the most accurate inquirer into the structure of these organs, confesses, he always found it in vain, though in the most unselected subjects and ages: all he could find was, a different degree of brittleness or softness, and different corrugations, which were greater or less, according to the respective ages: the aperture being still the less, and the rugosities the greater, as the subject was younger, and more untouched.

Dr. Drake, on the other hand, declares, that in all the subjects he had opportunity to examine, he does not remember to have noticed the hymen so much as once, where he had reason to depend on finding it. The female view he ever had of it was, in a maid who died at thirty years of age, in this he found it a membrane of some strength, furnished with fleshy fibres, in figure round, and perforated in the middle with a small hole, capable of admitting the end of a woman's little finger, and situate a little above the orifice of the urinary passage, at the entrance of the vagina of the womb.

In infants, it is a fine thin membrane, not very conspicuous, because of the natural strainness of the passage itself, which does not admit of any great expansion in its little room; which might lead De Graaf into a notion of its being no more than a corrugation.

This incanore, like most others, does, probably, grow more distinct, as well as firm, by age. That it not only exsils, but is sometimes very strong and imperious, may be collected, from the history of a case reported by Mr. Coemper. In a married woman, twenty years of age, whose *amen* was found altogether imperious, so as to detain the menses, and to be driven out, by the pressure thereof, beyond the labia of the pudendum, not unlike a stone, and to be driven down, at least a yelp, of the uterus, as it came forth. It found the husband, being denied a passage that way, had found another through the nearest window; which was found very open, and its fles extruded like the anus of a cock.

Upon a rupture of the hymen, after the consummation of marriage, and especially delivery, its parts, shrinking up, are supposed to form those little fleshy knots, called *caruncula myrtiformis*.

HYMEN, in *Botany*, is used for a fine, delicate skin, where-
with flowers are enclosed while in the bud, and which
bursts as the flower blows or opens.

The term *hymen*, in this sense, is particularly used in speaking of policy.

Hymen, in *Religion* and *Poetry*, a term of invocation. *Hymen*, or *Hymeneus*, is properly a fabulous divinity, supposed by the ancients to preside over marriages; and who accordingly was invoked in epithalamiums, and other matrimonial ceremonies, under the formula, *Hymen e Hymene!*

The poets generally crown this deity with a chaplet sometimes of roses, at other times of sweet marjoram; and represent him, as it were, dissolved and enervated with pleasures; dressed in a yellow robe, and shoes of the same colour, with a torch in his right-hand, and a flame-coloured veil in his left. Catullus, in one of his epigrams, addresses him thus:

*Cinge tempora floribus,
Suavolentis amaraci.*

It was for this reason, that the new married-couple bore garlands or flowers on the wedding-day; which custom also obtained among the Hebrews, and even among the Christians, during the first ages of the church, as appears from Tertullian, De Corona Militari, where he says, *Cremat & nuptis spargit*. St. Chrysostom likewise mentions these crowns of flowers; and to this day the Greeks call marriages *ῥοσφορέα*, in respect of this crown or garland.

HYMENÆA, in Botany. See LOCUST-tree.

HYMENODES, of *anus*, *membrane*, and *anus*, form, an epithet applied by the old authors to such urine as is found to be full of little films and pellicles. Hippocrates also applies it to the menstrual discharges, when they are mixed with a tough viscid phlegm.

HYMENOPTERA, derived from *hymen*, membrane, and *pteron*, wings, in the Linnaean system of *Natural History*. Is an order of insects, having four membranaceous wings, and the tails of the females are furnished with stings, which in some are used for inflicting poison, and in others for merely piercing the bark and leaves of trees, and the bodies of other animals, in which they deposit their eggs. To this class belong ten genera, *viz.* *api*, *tenellidae*, *serex*, *ichneumon*, *aphes*, *eryth*, *cygus*, or the wasp, *api* or *bee*, *farnice* or *ant*, and *mutilla*, comprehending a great number of subordinate species.

H Y O

HYMETTIUM *synonym.* See MARBLE.

HYMN, a song, or ode, in honour of God; or a poem proper to be sung, composed in honour of some deity. See Ode, and Song.

The word is Greek, ὕμνος, *hymn*, formed of the verb ἑῖπαι, *celebrare*. *I celebrate*.

Indore, on this word, remarks, that *hyma* is properly a song of joy, full of the praises of God; by which, according to him, it is distinguished from *threna*, which is a mourning song, full of lamentation.

The *hymns*, or odes, of the ancients, generally consisted of three stanzas or couplets: the first called *propheta*; the second, *antiphona*; and the last, *epode*.

St. Hilary, bishop of Poitiers, is said to have been the first that composed *ymns* to be sung in churches: he was followed by St. Ambrose. Most of those in the Roman Breviary were composed by Prudentius. They have been translated into French verse by *Messieurs De Port Royal*. The *Te Deum* is also commonly called a *ymn*, though it be not in verse: so also is the *Gloria in excelsis*.

In the Greek Liturgy there are four kinds of *hymns*; but then the word is not taken in the sense of a praise offered in verse, but simply of laud, or praise. The angelic *hymn*, or *GLORIA IN EXCELSIS*, makes the first kind; the *TRISAGION*, the second; the cherubic *hymn*, the third; and the *hymn* of victory and triumph, called *EXULTATION*, the last.

HYMNIA, in *Mythology*, a surname given to Diana, under which appellation she was worshipped, and had a temple in Arcadia.

HYO-EPIGLOTTICI, in *Astrony*, are muscular fibres, which go from the convex side of the basis of the os hyoides to the convex side of the epiglottis.

HYOGLOSSUS, in *Anatomy*, a muscle of the tongue, which some divide into three, calling them *SAPIO-GLOSSUS*, *ORATO-GLOSSUS*, and *CICCO-GLOSSUS*. When they act together, they serve to shorten the tongue and likewise to turn the point of the tongue between the teeth and the upper lip, and make it pass over that lip.

The inferior fleshy plane of the body of the tongue bends it upward toward the palate, and makes it pass along or lick the upper lip.

HYOIDES, *Hyoides*, in Anatomy. The *hyoides*, called also *hierns*, is a bone situate in the middle space between the angles of the lower jaw, or at the root of the tongue, making, as it were, the basis or foundation thereof. It is thus called from its imperfect resemblance of the Greek upilon γ ; the word being formed of σ and $\nu\delta\sigma$, *form*; for which reason it is called *stipuloides*, and *stipuloides*.

It is distinguished into the *basia*, which is the anterior part, and is the broadest and thickest; two large *cornua*, or *cornu*, which are the lateral parts, and two small *cornua* or appendices, which are the superior parts, to the upper end of which other appendices are frequently joined; whence also the appellation *bicorne* and *tricornis*.

The basis of the *hypois* is situated transversely, and is about a thumb's breadth long on the outer side, which is unequally convex; the inner being unequally concave. It is half a finger broad, and has a small protuberance in the middle. The cornua are an inch and half long, and broader at bottom than at the extremes, which are about two inches slender.

It has two cartilaginous processes, which ossify in adults, called *cornua*, flattened about the juncture of its cornua with the basis: they are tied to the processus styloides by long slender ligaments; though sometimes between them and the styloides there is found a small muscle, beside the styloceratohyoideus.

The basis of this bone lies, as it were, on the head of the larynx; and its horns are fastened by ligaments to the upper processes of the cartilago scutiformis, and styloides.

It is moved by five pair of muscles; viz. the Sternohyoideum, the ceratohyoideum, the mylohyoideum, the geniohyoideum, and Stylohyoideum.

The chief use of this bone is to be the basis and support of the tongue. The pliability of the small *cornua* is said likewise to contribute to the perfection of singing.

HYO-PHARYNGÆI, in *Anatomy*, are three pair of muscles, inserted in the larynx, and in the small and great cornua of the os hyoides.

HYOSCIAMUS, in Botany. See HENBANE.
HYOSCIAMUS Peruvianus, Henbane of Peru, a name by which Dodonæus and many other authors have called the tobacco-plants, more usually known by the name **SCOTIANA**.

HYOSERIS, in *Botany*, a genus of the *hyoseris polygonia* *aqualis* class; with a naked receptacle, sub-equal calyx, and four discernible capillary down.

HYOSYRIS, in *Batany*, a name given by Pliny and some other authors to the common knapweed, or *jacca nigra*.

HYOTHYROIDÆI, compounded of *hypo*, and *thyroid*, in *Anatomy*, a pair of muscles of the larynx; which, arising from the anterior part of the os hyoides, are inserted into the cartilago thyroidea. They serve as antagonists to the *thyrohyoidei*, and lift up the thyroid cartilage.

HYPACIC medicines, formed of *hypo*, *I take away*, a term used by some authors for cathartic medicines.

HYPÆTHROS, or **HYPÆTHRON**, *Transitum*, formed of *hypo*, under, and *athro*, air, in the *Ancient Architecture*, a kind of temple, open at the top, and thereby exposed to the air.

The *hypæthron*, according to Vitruvius, is an open building or portico, such as anciently were certain temples that had no roof or covering. Of this we have an instance, in the temple of Jupiter Olympius, built by Colossus, a Roman architect at Athens.

Of *hypæthra*, some were decalthe, others pycnostyle; but they had all rows of columns within-side, forming a kind of *peristyle*, which was essential to this sort of temple.

HYPALLAGE, *immixtio*, a grammatical figure, whereby, of different expressions which give the same idea, we make choice of that which is least natural and obvious; or, when there is a mutual permutation or change of cases, moods, regimens, &c.

The term is formed of *hypo*, *I change*, compounded of *hypo*, under, and *allago*, under.

As in this instance, *Dare dignum auxilium* instead of *Dare iussu auxilium*.

HYPAPANTE, or **HYRANTE**, a name which the Greeks give to the wall of the Purification of the holy Virgin; or the presentation of Jesus in the temple. The words are Greek, *hypo*, and *hante*, which properly signify *humilis*, and *hanti* meaning; being compounded of *hypo*, under, beneath, and *hanti*, or *hante*. *I went, or came, or arrived*. The denominations are taken from the meeting of old Simeon, and Anna the prophetess, in the temple, at the name the child Christ Jesus was brought thither.

HYPATE, in the *Ancient Music*, an appellation given to the lowest chord or sound of a tetrachord.

The word is Greek, *hypo*, which some Latin interpreters translate by *supra*, as they translate *hypo*, by *sub* or *under*.

Dr. Wallis says, that the first counters of these names took, contrary to our custom, the grave for the highest place, and the acute for the lowest of their schemes.

This was the practice of Boethius; and Nichomachus, in the *heptachord lyre*, ascribes the *hypate* to Saturn, and the *mesite*, or *mes*, to the Moon. Some however interpret *hypo*, as if it were *supra*, but erroneously, according to the learned doctor just quoted, who observes, that Homer calls *Ἰννα* *Ἰννα*, as if *hypo* were derived from *supra*. Afterwards it is said, the grave was taken for the lowest, and the acute for the highest place, agreeably to our notions. Some think that the *hypate* might obtain its name from being placed highest in the lyre. Marcianus Capella and Boethius, translate *hypate*, *principalis*, and *parvate*, *subprincipalis*. Also Aristides Quintilianus chooses to call the *hypate* first, rather than supreme or highest, and calls the *mes* last, instead of lowest. Perhaps the truth of the matter is, that the *hypate* was called highest or lowest, according as musicians considered the descending or the ascending scale. The movable chord next the *hypate*, was called *parvate*; and that next the *mes* was called *parvate*. See **TETRACHORD** and **INTERVAL**.

HYPATE, *hypate*, in the *Ancient Greek Scale*, was the note next to the *prolambanomenos*, and answers to the lowest *mi* of Guido's scale. See **DIAGRAM** and **INTERVAL**.

HYPATE, *hypate*, in the *Greek Scale of Music*, was the first note of the *meson*, and the last of the *hypaton* tetrachord. It answers to *la* minor of the Guidoian scale. See **DIAGRAM** and **INTERVAL**.

HYPECOMUM, in *Botany*, a genus of the *tribus* *Agrostaceae*. Its characters are these: the flower has four petals, and a two-leaved envelopment; and has four stamina situated between the petals; in the centre is placed an oblong cylindrical germ, which becomes a long, compressed, jointed pod, which is incurved, with one roundish compressed seed in each joint. There are three species.

The juice of this plant is of a yellow colour, resembling that of celandine; and is affirmed by some eminent physicians to have the same effect as opium. Miller.

HYPERNEMUS, an epithet applied by authors to barren eggs, or such as a hen lays before the has been trod by the cock. They are also called *staphyria* *ova*, and had both these names from the winds being supposed to generate them.

HYPER, a Greek word used in the composition of divers terms derived from that language.

The Greek preposition *hyper*, literally signifies *above*, *beyond*; and in composition, it expresses *more excess*, or something beyond the signification of the simple word it is joined with. Hence,

HYPERBATON, or **HYPERBASTIS**, in *Grammar* and *Rhetoric*, is a *TRANSPOSITION*, or a figurative construction, inverting the natural and proper order of the terms of a discourse.

The word is *translatio*, or *translatio*, derived of *hyper*, *above*, *transposition*, *I go beyond*; formed of *hyper*, *above*, *beyond*, and *bas*, *in*, *to*.

The *hyperbaton*, Longinus observes, is no other than a transposal of sentiments, or words, out of the natural order and method of discourse; and always implies great violence, or strength of passion, which naturally hurried a man out of himself, and distracts him variously. Thus, *Hyperbaton* is very liberal in *hyperbaton*.

Quintilian calls the *hyperbaton*, *verbi transpositio*. It is of use to enliven and animate the discourse: it is very proper to express a violent passion, and represent an agitation of mind in the liveliest manner.

HYPERBOLASMUS, *hyperbolicus*, in *Rhetoric*, a figure which inverts the order of construction. Cassiodorus Nicopolis gives an instance of it in his life of Chelidius: *Abbasque dum certum Chelidius praestantissimum, quam ante deum non vidisset, &c.* for ante quoniam.

HYPERBOLA, in *Geometry*, one of the conic lines, formed by the section of a cone. See **CONIC SECTION**.

The *hyperbola* arises when the plane that cuts the cone is not parallel to one of its sides, as it is in the *parabola*; but diverges from it outwards, not inwards, as in the *ellipse*.

Thus: if the cone ABC (see *Tab. Conicæ*, fig. 27.) be so cut, as that the axis of the section DQ, continued, convex with the side of the cone AC, continued to E; the curve arising from this section is an *hyperbola*.

Some authors define the *hyperbola* to be, a section of the cone by a plane parallel to its axis; but this definition is faulty: for though it be true, that such a section really describes an *hyperbola*; yet it is likewise true, that a thousand others may be described where the plane is not parallel to the axis, and which of consequence are not included in the definition.

Authors sometimes call the plane terminated by this curve, an *hyperbola*, and in respect thereof, call the curve itself, the *hyperbolic line*.

An *hyperbola* may be defined, with respect to its properties, to be a curve line, wherein the square of the semi-ordinate is to the rectangle of the abscissa into a right line composed of the same abscissa and a given right line called the *transverse axis*, as another given right line, called the *parameter* of the axis, is to the *transverse axis*; or it is a curve line, wherein the ordinate *y*, abscissa *x*, and parameter *p*, oblique $a^2 = bx + px$, that is, $p: a:: x: a + x$.

In the *hyperbola*, a mean proportional between the *transverse axis* and parameter, is called the *conjugate axis*; and if the *transverse axis* AB (*Tab. Conicæ*, fig. 27. n. 2.) be joined directly to the axis AX, and be bisected in C, the point C is called the *centre* of the *hyperbola*.

If a right line DE pass through the vertex A, fig. 20, parallel to the ordinate *AM*, it is a tangent to the *hyperbola* in A.

If a right line DE be drawn through the vertex A of an *hyperbola* parallel to the ordinate *AM*, and be equal to the conjugate axis, viz. the parts DA and AE equal to the semi-axis; and right lines CF and CG be drawn from the centre C through D and E; those lines are called *asymptotes* of the *hyperbola*.

The figure of the right line CI, or AI, is called the *power* of the *hyperbola*.

PROPORTION OF THE HYPERBOLA. 1. In the *hyperbola*, the squares of the semi-ordinates are to each other, as rectangles of the abscissa into a certain right line composed of the abscissa and *transverse axis*. Hence, as the abscissa *x* increase, the rectangles $x + x^2$, and consequently the squares of the semi-ordinates y^2 ; and therefore the semi-ordinates themselves increase. The *hyperbola*, therefore, continually recedes from its axis.

2°. The square of the conjugate axis is to the square of the *transverse axis*, as the parameter to the *transverse axis*. And hence, since $p: a:: PM: AP \times PB$, the square of the conjugate axis is, to the square of the *transverse axis*, as the square of the semi-ordinate is to the rectangle of the abscissa into a line composed of the abscissa and *transverse axis*.

3°. To describe an *hyperbola*, by continued motion; the *transverse axis*, and the distance from the vertex, being given. In the two foci F and Z, fig. 28. fix two nails or pins; and to one of them, in F, tie a thread, FMC, following the other end C to the ruler CZ, which exceeds the same by the *transverse axis* AB. The other end of the

ruler being perforated, put it on the pin Z , and fixing a style to the thread, move the ruler. Thus will the style trace out an *hyperbola*. Again, with the same data, any number of points in an *hyperbola* are easily found, which may be connected into an *hyperbola*. Thus, from the focus S , with any interval ZM greater than AB , describe an arch; and making $z = AB$, with the remaining interval z , from the point F , draw another arch intersecting the former in m ; therefore $Zm = Fm = AB$; m is a point in the *hyperbola*. And so of the rest.

4°. If in an *hyperbola*, the semiordinate PM , fig. 20, be produced till it meet the asymptote in R ; the difference of the squares of PM and PR is equal to the square of the conjugate semi-axis DA or CA . Hence as the semiordinate PM increases, the right line MR decreases, and therefore the *hyperbola* itself approaches nearer to the asymptotes; but it can never absolutely meet it, because $PR^2 - PM^2 = DA^2$; it is impossible $PR^2 - PM^2$ should ever become 0 .

5°. In an *hyperbola*, the rectangle of MR and Mr is equal to the difference of the squares PR^2 and PM^2 . And hence the same rectangle is equal to the square of the conjugate semi-axis DA ; and consequently all rectangles formed in the same manner are equal.

6°. If q m be parallel to the asymptote CF , the rectangle of q m into Cq is equal to the power of the *hyperbola*. And hence, 1°. If we make $CI = AI = a$, $Cq = r$, and $q = z$, we shall have $a^2 = r^2 + z^2$, which is the equation expressing the nature of the *hyperbola* between its asymptotes. 2°. The asymptotes, therefore, being given in position, and the side of the power of CI or AI ; if in one of the asymptotes CG , you take any number of abscissas; to many semiordinates will be found, and by them any number of points in an *hyperbola* will be determined by finding third proportionals to the abscissas, and the side of the power CI . 3°. If the abscissas be not computed from the centre C , but from some other point L , and CL be supposed $= 1$; we shall have $Cq = a + x$; and consequently $a^2 = 1 + x^2 + z^2$.

7°. In the *hyperbola*, as the transverse axis is to the parameter, so is the aggregate of the transverse semi-axis and abscissa, to the subnormal; and as the aggregate of the transverse semi-axis and abscissa is to the abscissa; so is the aggregate of the entire transverse axis and abscissa to the sub-tangent.

8°. If within the asymptotes of an *hyperbola*, from a point thereof, m , fig. 20, be drawn two right lines Hm and Kn , and other two Ln and NO , parallel to the same; $Hm \times m \times K = Ln \times N \times O$. And the same will hold, if you draw Ln parallel to the right line thus drawn $Hm \times K$; viz. in this case, likewise, $Hm \times m \times K = Ln \times N \times O$. Consequently, all rectangles formed after this manner of right lines drawn parallel either to the same line HK , or to two, Hm and $m \times K$; are equal to each other.

9°. If a right line HK be drawn in any manner between the asymptotes of an *hyperbola*, the segments HE and HK intercepted on each side between the *hyperbola* and asymptotes are equal. And hence, if $Em = e$, the right line HK is a tangent to the *hyperbola*; consequently the tangent ED intercepted between the asymptotes, is bisected in the point of contact V . Lastly, the rectangle of the segments Hm and $m \times K$, parallel to the tangent ED , is equal to the square of half the tangent DV .

10°. If from the centre C , fig. 30, you draw a right line CA , and through the point A a tangent EAD terminated by the asymptotes, CA is a semi-transverse diameter; and EAD is equal to its conjugate diameter; and the square of the semiordinate in the *hyperbola* PM drawn parallel to the conjugate diameter is to the rectangle of the abscissas, and aggregate of the transverse diameter AB , and abscissa AP , as the square of the conjugate semi-diameter AD , is to the square of the transverse semi-diameter CA . Hence if you suppose $AP = a$, $PM = y$, $AD = b$, we shall have $y^2 = \frac{(a^2 + b^2 + a^2)}{2a^2} = \frac{a^2 + b^2}{2a^2} + \frac{a^2}{2a^2}$.

and making $\frac{a^2}{2a^2} = b$, we shall have $y^2 = b + \frac{b^2}{a^2}$. So that the same equation defines the nature of the *hyperbola*, in respect of its diameter, as expresses it in respect of its axis; and the parameter is a third proportional to the conjugate diameters DE and AB .

11°. If from the vertex A , and any point of the *hyperbola* N , you draw AF and TN parallel to the asymptote CR , the rectangle of TN into TC will be equal to the rectangle of FA into FC . Hence, if $TC = x$, $TN = y$, $FC = a$, and $FA = b$; the equation expressing the nature of an *hyperbola* within its asymptotes, in respect of its diameter, will be $y^2 = b + \frac{b^2}{x^2}$.

12°. An asymptote being taken for a diameter; divided into equal parts, and through all the divisions, which form so many abscissas continually increasing equally, ordinates to the curve being drawn parallel to the other

asymptote; the abscissas will represent an infinite series of natural numbers; and the corresponding *hyperbolic* or asymptotic spaces, will represent the series of LOGARITHMS of the same numbers. Hence different *hyperbolas* will furnish different series of logarithms to the same series of natural numbers; so that to determine any particular series of logarithms, choice must be made of some particular *hyperbola*. See CONIC section and LOGARITHMIC CURVE. Now, the most simple of all the *hyperbolas* is the equilateral one, i. e. that whose asymptotes make a right angle between them. This, M. De Lagny alleges in favour of the *DIARY arithmetic*, as being the result of such equilateral *hyperbola*.

ANIGENAL HYPERBOLA is that wherein one of its infinite legs is inscribed, and the other circumscribed.

EQUILATERAL HYPERBOLA is that wherein the conjugate axes AB , fig. 20, and DE , are equal.

PROPERTIES OF THE EQUILATERAL HYPERBOLA. Since the parameter is a third proportional to the conjugate axes, it is also equal to the axis; wherefore, if in the equation

$$y^2 = b + \frac{b^2}{x^2} \text{ you suppose } b = a; \text{ the equation } y^2 = a + \frac{a^2}{x^2} \text{ will express the nature of the equilateral hyperbola.}$$

And hence the squares of the ordinates y^2 and a^2 are to each other as $a + \frac{a^2}{x^2}$ and $a + \frac{a^2}{x^2}$; that is, as the rectangles of the abscissas into right lines composed of the abscissas and parameter.

If you suppose $PC = x$, $CA = r$, then will $AP = x - r$, and $PB = x + r$. Consequently $y^2 = x^2 - r^2$. And since $AE = CA$; the angle ACE will be half right; and consequently the angle of the asymptotes FCG a right angle.

INFLECT HYPERBOLAS, or HYPERBOLAS of the higher kind, are those defined by the equation $y^2 = b + \frac{b^2}{x^2} + \frac{b^2}{x^4}$ ($b + \frac{b^2}{x^2}$). Hence in the infinite *hyperbolas* $y^2 = b + \frac{b^2}{x^2} + \frac{b^2}{x^4} + \frac{b^2}{x^6} + \frac{b^2}{x^8} + \frac{b^2}{x^{10}} + \frac{b^2}{x^{12}} + \frac{b^2}{x^{14}} + \frac{b^2}{x^{16}} + \frac{b^2}{x^{18}} + \frac{b^2}{x^{20}} + \frac{b^2}{x^{22}} + \frac{b^2}{x^{24}} + \frac{b^2}{x^{26}} + \frac{b^2}{x^{28}} + \frac{b^2}{x^{30}} + \frac{b^2}{x^{32}} + \frac{b^2}{x^{34}} + \frac{b^2}{x^{36}} + \frac{b^2}{x^{38}} + \frac{b^2}{x^{40}} + \frac{b^2}{x^{42}} + \frac{b^2}{x^{44}} + \frac{b^2}{x^{46}} + \frac{b^2}{x^{48}} + \frac{b^2}{x^{50}} + \frac{b^2}{x^{52}} + \frac{b^2}{x^{54}} + \frac{b^2}{x^{56}} + \frac{b^2}{x^{58}} + \frac{b^2}{x^{60}} + \frac{b^2}{x^{62}} + \frac{b^2}{x^{64}} + \frac{b^2}{x^{66}} + \frac{b^2}{x^{68}} + \frac{b^2}{x^{70}} + \frac{b^2}{x^{72}} + \frac{b^2}{x^{74}} + \frac{b^2}{x^{76}} + \frac{b^2}{x^{78}} + \frac{b^2}{x^{80}} + \frac{b^2}{x^{82}} + \frac{b^2}{x^{84}} + \frac{b^2}{x^{86}} + \frac{b^2}{x^{88}} + \frac{b^2}{x^{90}} + \frac{b^2}{x^{92}} + \frac{b^2}{x^{94}} + \frac{b^2}{x^{96}} + \frac{b^2}{x^{98}} + \frac{b^2}{x^{100}} + \frac{b^2}{x^{102}} + \frac{b^2}{x^{104}} + \frac{b^2}{x^{106}} + \frac{b^2}{x^{108}} + \frac{b^2}{x^{110}} + \frac{b^2}{x^{112}} + \frac{b^2}{x^{114}} + \frac{b^2}{x^{116}} + \frac{b^2}{x^{118}} + \frac{b^2}{x^{120}} + \frac{b^2}{x^{122}} + \frac{b^2}{x^{124}} + \frac{b^2}{x^{126}} + \frac{b^2}{x^{128}} + \frac{b^2}{x^{130}} + \frac{b^2}{x^{132}} + \frac{b^2}{x^{134}} + \frac{b^2}{x^{136}} + \frac{b^2}{x^{138}} + \frac{b^2}{x^{140}} + \frac{b^2}{x^{142}} + \frac{b^2}{x^{144}} + \frac{b^2}{x^{146}} + \frac{b^2}{x^{148}} + \frac{b^2}{x^{150}} + \frac{b^2}{x^{152}} + \frac{b^2}{x^{154}} + \frac{b^2}{x^{156}} + \frac{b^2}{x^{158}} + \frac{b^2}{x^{160}} + \frac{b^2}{x^{162}} + \frac{b^2}{x^{164}} + \frac{b^2}{x^{166}} + \frac{b^2}{x^{168}} + \frac{b^2}{x^{170}} + \frac{b^2}{x^{172}} + \frac{b^2}{x^{174}} + \frac{b^2}{x^{176}} + \frac{b^2}{x^{178}} + \frac{b^2}{x^{180}} + \frac{b^2}{x^{182}} + \frac{b^2}{x^{184}} + \frac{b^2}{x^{186}} + \frac{b^2}{x^{188}} + \frac{b^2}{x^{190}} + \frac{b^2}{x^{192}} + \frac{b^2}{x^{194}} + \frac{b^2}{x^{196}} + \frac{b^2}{x^{198}} + \frac{b^2}{x^{200}} + \frac{b^2}{x^{202}} + \frac{b^2}{x^{204}} + \frac{b^2}{x^{206}} + \frac{b^2}{x^{208}} + \frac{b^2}{x^{210}} + \frac{b^2}{x^{212}} + \frac{b^2}{x^{214}} + \frac{b^2}{x^{216}} + \frac{b^2}{x^{218}} + \frac{b^2}{x^{220}} + \frac{b^2}{x^{222}} + \frac{b^2}{x^{224}} + \frac{b^2}{x^{226}} + \frac{b^2}{x^{228}} + \frac{b^2}{x^{230}} + \frac{b^2}{x^{232}} + \frac{b^2}{x^{234}} + \frac{b^2}{x^{236}} + \frac{b^2}{x^{238}} + \frac{b^2}{x^{240}} + \frac{b^2}{x^{242}} + \frac{b^2}{x^{244}} + \frac{b^2}{x^{246}} + \frac{b^2}{x^{248}} + \frac{b^2}{x^{250}} + \frac{b^2}{x^{252}} + \frac{b^2}{x^{254}} + \frac{b^2}{x^{256}} + \frac{b^2}{x^{258}} + \frac{b^2}{x^{260}} + \frac{b^2}{x^{262}} + \frac{b^2}{x^{264}} + \frac{b^2}{x^{266}} + \frac{b^2}{x^{268}} + \frac{b^2}{x^{270}} + \frac{b^2}{x^{272}} + \frac{b^2}{x^{274}} + \frac{b^2}{x^{276}} + \frac{b^2}{x^{278}} + \frac{b^2}{x^{280}} + \frac{b^2}{x^{282}} + \frac{b^2}{x^{284}} + \frac{b^2}{x^{286}} + \frac{b^2}{x^{288}} + \frac{b^2}{x^{290}} + \frac{b^2}{x^{292}} + \frac{b^2}{x^{294}} + \frac{b^2}{x^{296}} + \frac{b^2}{x^{298}} + \frac{b^2}{x^{300}} + \frac{b^2}{x^{302}} + \frac{b^2}{x^{304}} + \frac{b^2}{x^{306}} + \frac{b^2}{x^{308}} + \frac{b^2}{x^{310}} + \frac{b^2}{x^{312}} + \frac{b^2}{x^{314}} + \frac{b^2}{x^{316}} + \frac{b^2}{x^{318}} + \frac{b^2}{x^{320}} + \frac{b^2}{x^{322}} + \frac{b^2}{x^{324}} + \frac{b^2}{x^{326}} + \frac{b^2}{x^{328}} + \frac{b^2}{x^{330}} + \frac{b^2}{x^{332}} + \frac{b^2}{x^{334}} + \frac{b^2}{x^{336}} + \frac{b^2}{x^{338}} + \frac{b^2}{x^{340}} + \frac{b^2}{x^{342}} + \frac{b^2}{x^{344}} + \frac{b^2}{x^{346}} + \frac{b^2}{x^{348}} + \frac{b^2}{x^{350}} + \frac{b^2}{x^{352}} + \frac{b^2}{x^{354}} + \frac{b^2}{x^{356}} + \frac{b^2}{x^{358}} + \frac{b^2}{x^{360}} + \frac{b^2}{x^{362}} + \frac{b^2}{x^{364}} + \frac{b^2}{x^{366}} + \frac{b^2}{x^{368}} + \frac{b^2}{x^{370}} + \frac{b^2}{x^{372}} + \frac{b^2}{x^{374}} + \frac{b^2}{x^{376}} + \frac{b^2}{x^{378}} + \frac{b^2}{x^{380}} + \frac{b^2}{x^{382}} + \frac{b^2}{x^{384}} + \frac{b^2}{x^{386}} + \frac{b^2}{x^{388}} + \frac{b^2}{x^{390}} + \frac{b^2}{x^{392}} + \frac{b^2}{x^{394}} + \frac{b^2}{x^{396}} + \frac{b^2}{x^{398}} + \frac{b^2}{x^{400}} + \frac{b^2}{x^{402}} + \frac{b^2}{x^{404}} + \frac{b^2}{x^{406}} + \frac{b^2}{x^{408}} + \frac{b^2}{x^{410}} + \frac{b^2}{x^{412}} + \frac{b^2}{x^{414}} + \frac{b^2}{x^{416}} + \frac{b^2}{x^{418}} + \frac{b^2}{x^{420}} + \frac{b^2}{x^{422}} + \frac{b^2}{x^{424}} + \frac{b^2}{x^{426}} + \frac{b^2}{x^{428}} + \frac{b^2}{x^{430}} + \frac{b^2}{x^{432}} + \frac{b^2}{x^{434}} + \frac{b^2}{x^{436}} + \frac{b^2}{x^{438}} + \frac{b^2}{x^{440}} + \frac{b^2}{x^{442}} + \frac{b^2}{x^{444}} + \frac{b^2}{x^{446}} + \frac{b^2}{x^{448}} + \frac{b^2}{x^{450}} + \frac{b^2}{x^{452}} + \frac{b^2}{x^{454}} + \frac{b^2}{x^{456}} + \frac{b^2}{x^{458}} + \frac{b^2}{x^{460}} + \frac{b^2}{x^{462}} + \frac{b^2}{x^{464}} + \frac{b^2}{x^{466}} + \frac{b^2}{x^{468}} + \frac{b^2}{x^{470}} + \frac{b^2}{x^{472}} + \frac{b^2}{x^{474}} + \frac{b^2}{x^{476}} + \frac{b^2}{x^{478}} + \frac{b^2}{x^{480}} + \frac{b^2}{x^{482}} + \frac{b^2}{x^{484}} + \frac{b^2}{x^{486}} + \frac{b^2}{x^{488}} + \frac{b^2}{x^{490}} + \frac{b^2}{x^{492}} + \frac{b^2}{x^{494}} + \frac{b^2}{x^{496}} + \frac{b^2}{x^{498}} + \frac{b^2}{x^{500}} + \frac{b^2}{x^{502}} + \frac{b^2}{x^{504}} + \frac{b^2}{x^{506}} + \frac{b^2}{x^{508}} + \frac{b^2}{x^{510}} + \frac{b^2}{x^{512}} + \frac{b^2}{x^{514}} + \frac{b^2}{x^{516}} + \frac{b^2}{x^{518}} + \frac{b^2}{x^{520}} + \frac{b^2}{x^{522}} + \frac{b^2}{x^{524}} + \frac{b^2}{x^{526}} + \frac{b^2}{x^{528}} + \frac{b^2}{x^{530}} + \frac{b^2}{x^{532}} + \frac{b^2}{x^{534}} + \frac{b^2}{x^{536}} + \frac{b^2}{x^{538}} + \frac{b^2}{x^{540}} + \frac{b^2}{x^{542}} + \frac{b^2}{x^{544}} + \frac{b^2}{x^{546}} + \frac{b^2}{x^{548}} + \frac{b^2}{x^{550}} + \frac{b^2}{x^{552}} + \frac{b^2}{x^{554}} + \frac{b^2}{x^{556}} + \frac{b^2}{x^{558}} + \frac{b^2}{x^{560}} + \frac{b^2}{x^{562}} + \frac{b^2}{x^{564}} + \frac{b^2}{x^{566}} + \frac{b^2}{x^{568}} + \frac{b^2}{x^{570}} + \frac{b^2}{x^{572}} + \frac{b^2}{x^{574}} + \frac{b^2}{x^{576}} + \frac{b^2}{x^{578}} + \frac{b^2}{x^{580}} + \frac{b^2}{x^{582}} + \frac{b^2}{x^{584}} + \frac{b^2}{x^{586}} + \frac{b^2}{x^{588}} + \frac{b^2}{x^{590}} + \frac{b^2}{x^{592}} + \frac{b^2}{x^{594}} + \frac{b^2}{x^{596}} + \frac{b^2}{x^{598}} + \frac{b^2}{x^{600}} + \frac{b^2}{x^{602}} + \frac{b^2}{x^{604}} + \frac{b^2}{x^{606}} + \frac{b^2}{x^{608}} + \frac{b^2}{x^{610}} + \frac{b^2}{x^{612}} + \frac{b^2}{x^{614}} + \frac{b^2}{x^{616}} + \frac{b^2}{x^{618}} + \frac{b^2}{x^{620}} + \frac{b^2}{x^{622}} + \frac{b^2}{x^{624}} + \frac{b^2}{x^{626}} + \frac{b^2}{x^{628}} + \frac{b^2}{x^{630}} + \frac{b^2}{x^{632}} + \frac{b^2}{x^{634}} + \frac{b^2}{x^{636}} + \frac{b^2}{x^{638}} + \frac{b^2}{x^{640}} + \frac{b^2}{x^{642}} + \frac{b^2}{x^{644}} + \frac{b^2}{x^{646}} + \frac{b^2}{x^{648}} + \frac{b^2}{x^{650}} + \frac{b^2}{x^{652}} + \frac{b^2}{x^{654}} + \frac{b^2}{x^{656}} + \frac{b^2}{x^{658}} + \frac{b^2}{x^{660}} + \frac{b^2}{x^{662}} + \frac{b^2}{x^{664}} + \frac{b^2}{x^{666}} + \frac{b^2}{x^{668}} + \frac{b^2}{x^{670}} + \frac{b^2}{x^{672}} + \frac{b^2}{x^{674}} + \frac{b^2}{x^{676}} + \frac{b^2}{x^{678}} + \frac{b^2}{x^{680}} + \frac{b^2}{x^{682}} + \frac{b^2}{x^{684}} + \frac{b^2}{x^{686}} + \frac{b^2}{x^{688}} + \frac{b^2}{x^{690}} + \frac{b^2}{x^{692}} + \frac{b^2}{x^{694}} + \frac{b^2}{x^{696}} + \frac{b^2}{x^{698}} + \frac{b^2}{x^{700}} + \frac{b^2}{x^{702}} + \frac{b^2}{x^{704}} + \frac{b^2}{x^{706}} + \frac{b^2}{x^{708}} + \frac{b^2}{x^{710}} + \frac{b^2}{x^{712}} + \frac{b^2}{x^{714}} + \frac{b^2}{x^{716}} + \frac{b^2}{x^{718}} + \frac{b^2}{x^{720}} + \frac{b^2}{x^{722}} + \frac{b^2}{x^{724}} + \frac{b^2}{x^{726}} + \frac{b^2}{x^{728}} + \frac{b^2}{x^{730}} + \frac{b^2}{x^{732}} + \frac{b^2}{x^{734}} + \frac{b^2}{x^{736}} + \frac{b^2}{x^{738}} + \frac{b^2}{x^{740}} + \frac{b^2}{x^{742}} + \frac{b^2}{x^{744}} + \frac{b^2}{x^{746}} + \frac{b^2}{x^{748}} + \frac{b^2}{x^{750}} + \frac{b^2}{x^{752}} + \frac{b^2}{x^{754}} + \frac{b^2}{x^{756}} + \frac{b^2}{x^{758}} + \frac{b^2}{x^{760}} + \frac{b^2}{x^{762}} + \frac{b^2}{x^{764}} + \frac{b^2}{x^{766}} + \frac{b^2}{x^{768}} + \frac{b^2}{x^{770}} + \frac{b^2}{x^{772}} + \frac{b^2}{x^{1088}} + \frac{b^2}{x^{1090}} + \frac{b^2}{x^{1092}} + \frac{b^2}{x^{1094}} + \frac{b^2}{x^{1096}} + \frac{b^2}{x^{1098}} + \frac{b^2}{x^{1100}} + \frac{b^2}{x^{1102}} + \frac{b^2}{x^{1104}} + \frac{b^2}{x^{1106}} + \frac{b^2}{x^{1108}} + \frac{b^2}{x^{1110}} + \frac{b^2}{x^{1112}} + \frac{b^2}{x^{1114}} + \frac{b^2}{x^{1116}} + \frac{b^2}{x^{1118}} + \frac{b^2}{x^{1120}} + \frac{b^2}{x^{1122}} + \frac{b^2}{x^{1124}} + \frac{b^2}{x^{1126}} + \frac{b^2}{x^{1128}} + \frac{b^2}{x^{1130}} + \frac{b^2}{x^{1132}} + \frac{b^2}{x^{1134}} + \frac{b^2}{x^{1136}} + \frac{b^2}{x^{1138}} + \frac{b^2}{x^{1140}} + \frac{b^2}{x^{1142}} + \frac{b^2}{x^{1144}} + \frac{b^2}{x^{1146}} + \frac{b^2}{x^{1148}} + \frac{b^2}{x^{1150}} + \frac{b^2}{x^{1152}} + \frac{b^2}{x^{1154}} + \frac{b^2}{x^{1156}} + \frac{b^2}{x^{1158}} + \frac{b^2}{x^{1160}} + \frac{b^2}{x^{1162}} + \frac{b^2}{x^{1164}} + \frac{b^2}{x^{1166}} + \frac{b^2}{x^{1168}} + \frac{b^2}{x^{1170}} + \frac{b^2}{x^{1172}} + \frac{b^2}{x^{1174}} + \frac{b^2}{x^{1176}} + \frac{b^2}{x^{1178}} + \frac{b^2}{x^{1180}} + \frac{b^2}{x^{1182}} + \frac{b^2}{x^{1184}} + \frac{b^2}{x^{1186}} + \frac{b^2}{x^{1188}} + \frac{b^2}{x^{1190}} + \frac{b^2}{x^{1192}} + \frac{b^2}{x^{1194}} + \frac{b^2}{x^{1196}} + \frac{b^2}{x^{1198}} + \frac{b^2}{x^{1200}} + \frac{b^2}{x^{1202}} + \frac{b^2}{x^{1204}} + \frac{b^2}{x^{1206}} + \frac{b^2}{x^{1208}} + \frac{b^2}{x^{1210}} + \frac{b^2}{x^{1212}} + \frac{b^2}{x^{1214}} + \frac{b^2}{x^{1216}} + \frac{b^2}{x^{1218}} + \frac{b^2}{x^{1220}} + \frac{b^2}{x^{1222}} + \frac{b^2}{x^{1224}} + \frac{b^2}{x^{1226}} + \frac{b^2}{x^{1228}} + \frac{b^2}{x^{1230}} + \frac{b^2}{x^{1232}} + \frac{b^2}{x^{1234}} + \frac{b^2}{x^{1236}} + \frac{b^2}{x^{1238}} + \frac{b^2}{x^{1240}} + \frac{b^2}{x^{1242}} + \frac{b^2}{x^{1244}} + \frac{b^2}{x^{1246}} + \frac{b^2}{x^{1248}} + \frac{b^2}{x^{1250}} + \frac{b^2}{x^{1252}} + \frac{b^2}{x^{1254}} + \frac{b^2}{x^{1256}} + \frac{b^2}{x^{1258}} + \frac{b^2}{x^{1260}} + \frac{b^2}{x^{1262}} + \frac{b^2}{x^{1264}} + \frac{b^2}{x^{1266}} + \frac{b^2}{x^{1268}} + \frac{b^2}{x^{1270}} + \frac{b^2}{x^{1272}} + \frac{b^2}{x^{1274}} + \frac{b^2}{x^{1276}} + \frac{b^2}{x^{1278}} + \frac{b^2}{x^{1280}} + \frac{b^2}{x^{1282}}$

Although the area comprehended between the Apollonian *hyperbola* and its asymptote, be infinite, yet any segment, or sector of this curve, may be squared by means of logarithms. For instance: I suppose it required to find the area of the *hyperbola* segment EBCF, (Tab. III. *Analys.* fig. 61.) comprised between the arch of the curve ERF, the lines EB, FC parallel to the asymptote AB, and BC, the portion of the other asymptote intercepted between them. Then if ABED, the parallelogram of the *hyperbola*, be taken as unity, the space EBCF will be Napier's logarithm of the ratio of AC to AB, or of BE to FC. Hence if we had tables of such logarithms, we might find the area of EBCF by subducing the logarithm of FC from that of BE, and the difference would express the ratio of the segment to the parallelogram ABED or 1. But as such tables are not extant, some farther trouble is requisite to convert the common or vulgar's logarithm into Napier's. Take therefore from the common tables the LOGARITHM of the ratio of BE to FC, that is, the difference of their logarithms, and multiply this difference by 2.302585, the vulgar's logarithm of 10, the product will give the ratio of the segment to the parallelogram ABED or 1. Thus I suppose BE = 36, and CF = 5; and the parallelogram ABED = 1.

From 1. $56 \div 35 = \log. 1.57$

Subduct $0.6989700 = \log. 5$

Difference $0.8713295 = \log. 1.57$

Then $0.8713295 \times 2.302585 = 0.9740810$ for the area of the segment EBCF. This multiplication may be performed in Oughtred's contracted way.

Huygens, to avoid the multiplication by 2.302, &c. finds its logarithm to be 0.702175837, and always adds this to the logarithm of the difference before found, and then finds the number corresponding to this sum. See Horol. Oscillat. and Grandi, Dem. Theor. Huygen. in fine.

If it were proposed to find the area of the sector AERF, as this is equal to the segment EBCF, the same method may serve. But it may also be done by several other analogies; for which see Geom. Harmon. Musar. p. 10, 11. See also p. 25, 26, of the same book. See QUADRATURE.

HYPERBOLIC, *Τριγων. υπερβολη*, formed of the verb *hyperbassein*, to exceed, in *Rhetoric*, a figure, whereby the truth and reality of things are excessively either enlarged or diminished. See EXAGGERATION.

The character of an *hyperbole* is to exaggerate or extend the ideas of the thing spoken of, beyond the bounds of truth, or even probability. As, He ran faster than the wind; he went slower than a tortoise, &c.

Hyperbole, says Seneca, is without deceiving; they lead the mind to truth by fictions; they convey the sentiments intended, though by expressing it in terms which render it incredible. The *hyperbole* promises too much, in order to make you conceive enough. There is nothing faulty in an *hyperbole*, when it is *utrumque*, as Quintilian says, provided that it be not *altera mendax*.

Aristotle observes, that *hyperboles* are the favourite figures of young authors, who love excess and exaggeration; but that philosophers should not use them without a great deal of reserve.

The pitch to which an *hyperbole* may be carried, is a point of great decency; to carry it too far, is to destroy it: it is of the nature of a bow-string, which by immoderate tension, slackens; and frequently has an effect quite contrary to that intended. Longinus.

These *hyperboles* are best, which are literal, and are not taken for *hyperboles*. For this reason, they should scarce ever be used but in a passion, and in the midst of some important incident: such is the *hyperbole* of Herodotus, speaking of the Lacedaemonians, who fought at Thermopylae: 'They defended themselves, for some time, with the arms that were left them, and at last with their hands and teeth; till the Barbarians, continually shooting, buried them, as it were, with their arrows.' Now what likelihood is there, that naked men should defend themselves with their hands and teeth against armed men, and that so many persons should be buried under their enemies' arrows? Yet does there appear some probability in the thing, by reason it is not sought for the sake of the figure; but the *hyperbole* seems to arise out of the subject itself. Id.

Of the like kind is that passage of a comic poet, mentioned by Longinus: 'He had lands in the country no larger than a Lacedaemonian epistle.'

There are certain manners of tempering the harshness of *hyperboles*, and giving them an air of probability. Virgil says, that to see the fleets of Anony and Angulus at the battle of Actium, one would have taken them for the Lycians floating on the water; and Florus, speaking of the expectation whereby the Romans built a number of vessels in the first Punic war, says, 'I perceived not that the ships were built by workmen, but that the

trees were transformed into ships by the gods.' They do not say, that the ships were floating islands; nor that the trees were metamorphosed into ships; but only that one might have taken them to be so. This preparation serves as a kind of pulpit to the *hyperbole*, if we may be allowed the phrase, and makes it go down even in prose; for what is excused before it is said, is always heard favourably, how incredible forever it be. Bouthours. The excess in this trope is called *auxesis*; as when we say of any thing that is very high, it *reaches to the skies*; the defect or contrary extreme is termed *metoche*; as when we say of a very lean person, he is *nothing but skin and bones*, or a mere skeleton.

HYPERBOLION, in *Ancient Music*, is a name which the Greeks gave to the fifth or the most acute of their *tetrachords*, imagining this to be *hyperbolum*, *hyperbation*.

HYPERBOLIC, or **HYPERBOLICAL**, something relating either to an *HYPERBOLIC*, or an *HYPERBOLA*.

HYPERBOLIC CONOID. See CONOID.

HYPERBOLIC, in *Geometry*, is a solid figure, whose generation is given by Sir Christopher Wren, in the Philosophical Transactions.

Two opposite *hyperboles* being joined by the transverse axis, and through the centre, a right line being drawn at right angles to that axis; and above that, as an axis, the *hyperbola* being supposed to revolve; by such revolution, a body will be generated, which is called the *hyperbolic cycloid*, whose body, and all sections parallel to them, will be circles. In a subsequent translation, the same author applies the new figure to the grinding of a *spherical glass*; affirming that they must be formed this way, or not at all.

HYPERBOLIC Log of a curve, is that which approaches infinitely nearer to some asymptote.

Sir Isaac Newton reduces all curves, both of the first and of the higher kinds, into those with *hyperbolic Log*, and those with *parabolic ones*. See CURVE.

HYPERBOLIC Line is used by some authors for what we call the *hyperbola* itself.

In this sense, the plane surface, terminated by the curve line, is called the *hyperbola*; and the curve line that terminates it, the *hyperbolic line*.

HYPERBOLIC LOGARITHM. See LOGARITHM.

HYPERBOLIC Mirror. See MIRROR.

HYPERBOLIC SPHERE, in the *Higher Geometry*, the arch of space contained between the curve of the *hyperbola*, the asymptote, and the ordinate.

HYPERBOLICUM acutum, a solid made by the revolution of the infinite area of the *hyperbola* contained between the curve of the *hyperbola* and its asymptote. This produces a solid infinitely long, and yet is demonstrated to be equal to a finite solid or body. See LOGARITHMIC CURVE.

HYPERBOLIFORM Figures, are such curves as approach, in their properties, to the nature of the *hyperbola*; called also *hyperboloides*.

HYPERBOLOIDES, are *hyperboles* of the higher kind, whose nature is expressed by this equation: $y^2 + z^2 = b^2 + (x + a)^2$. See HYPERBOLA.

HYPERBOREAN, *Τριγων. υπερβολη*, in the *Ancient Geography*. The ancients denominated those people and places *Hyperboreans*, which were to the northwest of the Scythians. They had but very little acquaintance with these *Hyperborean* regions; and all they tell us of them is very precarious, and much of it false.

Diodorus Siculus says, the *Hyperboreans* were thus called because they dwelt beyond the wind *Boreas*; *veris*, signifying *above or beyond*; and *Boreas*, *Boreas*, the north wind. This etymology is very natural and plausible; notwithstanding all that Ruibech has said against it, who would have the word to be generally Gothic, and to signify *abundant*.

Herodotus doubts, whether or no there were any such thing as *Hyperborean* nations; Strabo, who professes that he believed there were, does not take *Hyperboreans* to signify *beyond Boreas*, or the north, as Herodotus understood it: the preposition *hyper*, in this case, he supposes only to help in forming a superlative; so that *hyperboreans*, on his principle, means no more than *most northern*; by which it appears the ancients scarce knew themselves what the name meant by it. Most of our modern geographers, as Hoffman, Cellarius, &c. have placed the *Hyperboreans* in the northern parts of the European continent, among the Siberians and Samoiets: according to them the *Hyperboreans* of the ancients were those, in general, who lived farthest to the north. The *Hyperboreans* of our days are those Russians who inhabit between the Volga and the White Sea. According to Clavier, the name *Ceches* was synonymous with that of *Hyperboreans*.

HYPERCATALECTIC, *Τριγων. υπερκαταληκτικη*, composed of *verses*, *verses*, *hyperbolic*, and *anapaests*, I put in the *anapaests*, I add to that *hypercatalectic* denotes as much as *superadded*; in the Greek and Latin Poetry, is applied to

verses which have one or two syllables too much; or beyond the regular measure. See *VARIA*.

The Greek and Latin verses are distinguished, with respect to their measure, into four kinds: *anapaestic*, verses, where nothing is wanting at the end; *catalectic*, which want a syllable at the end; *brachycatalectic*, which want a whole foot at the end; and lastly, *hypercatalectic*, which have one or two syllables too many. These last are also called *hypermetres*.

HYPERCATHARSIS, *ὑπερκαθάρσις*, compounded of the Greek *hyper*, *supra*, and *καθάρσις*, *I purge*, in *Medicine*, *super-purgation*; a too violent, and excessive purgation.

HYPERCHIRIA, in *Mythology*, a title of Juno, under which she was worshipped in Lacedæmon.

HYPERCRISIS, *ὑπερκρισις*, compounded of *hyper*, *supra*, and *κρισις*, *crisis*, judgment, in *Medicine*, any immoderate critical excretion.

Thus, when a fever terminates in a looseness, the humours sometimes flow off faster than the strength can bear, and are therefore to be checked. This is a *hyper-crisis*.

HYPERCRITIC, compounded of *hyper*, *supra*, and *κρισις*, of *κρισις*, *judice*, an over-tight censor, or critic; one who will let nothing pass, but animadverts severely on the slightest fault.

HYPERDIAZEUXIS, in *Ancient Music*, denotes the entire interval of the DIAPASON between two tetrachords; as between the *hypochordon* and *epichordon*.

HYPER-DORIC, in *Ancient Music*, was the name of one of their modes, called also *Misolydian*: it obtained this appellation, because its fundamental was one fourth above that of the Doric. See *MODE*.

HYPERDOLIA, *ὑπερδολία*, composed of *hyper*, *above*, and *δολία*, *workship*, in the *Romish Theology*, is the worship rendered to the holy VIRGIN. The worship offered to saints is called *dolia*; and that to the mother of God, *hyperdolia*; as being superior to the former.

HYPER-ÆOLIAN, in *Ancient Music*, is one of the names of the Greek modes; so called, because its fundamental was one fourth above that of the Æolian, from which it derived its origin.

HYPERICOIDES, in *Botany*. See *St. PETER'S WORT*.

HYPERICUM, in *Botany*. See *JOHN'S WORT*.

HYPERINTEIN, of *ὑπερ*, and *ἵντειν*, *purge*, a word used by Hippocrates for any excessive evacuation, but most frequently in the same sense as *hypercatharsis*, an over-purging.

HYPER-IONIAN, in *Ancient Music*, one of the Greek modes, whose fundamental was one fourth above the Ionian; it is the 12th mode ascending in the scale.

HYPER-LYDIAN, was the most acute of the fifteen Greek modes. Its fundamental was a fourth above the Lydian.

HYPERMETTER, compounded of *hyper*, *supra*, and *μετρον*, *measure*, in the *Ancient Poetry*, the same with *HYPERCATALECTIC*.

HYPEROGA, a word applied by authors to the upper part, or palate of the mouth, and the lute cerebri. It properly signifies any upper place.

HYPEROCHE, in *Music*, is the difference between the diatonic and chromatic scales. It is expressed by the proportion of 3125 to 3992; for, $1215 = 11 \cdot 111$. Mr. Hensling has made use of this term. *Mus. Berol.* vol. 1. p. 279, 280.

HYPERO-PHARYNGAL, in *Anatomy*, a name given by M. Sanson to the PRÆNAPHYLO-PHARYNGÆAL muscle.

HYPER-PHRYGIAN, in *Ancient Music*, called by Euclid *Hyperphrygian*, was the most acute of the thirteen modes of Aristæxenus.

HYPERSCARONIS, *ὑπερσκαρόνις*, in *Medicine and Surgery*, an excess of flesh; or rather, a fleshy excrecence, such as those generally arising on the lips of wounds, &c.

HYPERTHYRON, formed of *hyper*, *over*, and *θυρον*, *gate*, in the *Ancient Architecture*, a sort of table used after the manner of a frieze, over the jambs of Doric doors and gates, and the flueks of windows. It lies immediately under the corona; and is by our workmen usually called the *key-stone*.

HYPTHERE, in *Ancient Architecture*, two rows of pillars surrounding, and ten at each face of any temple, &c. with a peristyle within of six columns. See *HYETAROS*.

HYPHEN, *ὑφην*, in *Grammar*, an accent or character, which implies, that two words are to be joined, or connected into one compound word.—As, *male-administration*, &c.

Hyphen serve also to connect the syllables of such words as are divided by the end of the line.

HYPHALTES, *ὑφάλτες*, in *Mythology*, names given

by the Greeks to certain rural divinities answering to the *Incubi* of the Romans.

HYPNOTIC, *ὑπνωτικός*, derived from *ὑπνος*, *sleep*, in *Medicine*, a remedy which promotes or induces sleep; called also *specific* and *spasie*. See also *NARCOTIC*.

HYPNOTICUS (*serpens*, the *sleep-snake*), in *Zoology*, the name of an East Indian species of serpent, called by the Ceylonese *amigapala*, a word importing the same sense. It is of a deep blackish brown, variegated with spots of white, and is a very fatal kind in its poison, its bite always bringing on a sleep which ends in death.

HYPNUM, in *Botany*, the name of a genus of mosses of the *cryptogamia* class, the characters of which are these: the capsules or heads are uniform, and covered with a calyptra and operculum; they are usually of an oval or oblong figure, and commonly stand on long pedicels which arise from the side of the leaves, and are surrounded at the bottom with a foliaceous or lanuginous bed different from the leaves; this covering of the bottom of the stalk, is called by authors perichæum, and is itself a sufficient distinction of the *hypnum* from all other mosses, the *brya*, *munia*, *sphagna*, &c. having none of them any such thing. To this is to be added, that the branches of the *hypnum* are usually spread about upon the ground, and are perennial; and that there is what botanists call a *saues propra*, or peculiar look of the plant, which at first sight distinguishes the genus to an observer used to such things. *Dillen. Hist. Musc.* p. 270.

As the family of the *hypnum* is very numerous, they are usually divided into several orders. Of the first order are those *hypnum* which have erect heads, or at least such as are but a little bent; and of this order the first series comprehends such as are pinnated, or whose pinnæ are placed in two, sometimes in three rows on each stalk, or in the same plane. The first division of this series comprehends those which have flat and smooth pinnæ.

The second division of this series of the *hypnum*, contains those which have undulated and curled leaves. The second series of the *hypnum* is that of the fern-like kinds, called by many fern-mosses; these have their stalks every way surrounded with leaves, and their ramifications all placed in the same plane, so that they resemble the ferns.

The third series comprehends the squamose *hypnum*; that is, such as have their leaves every way surrounding the stalks in the manner of scales. Of these the first division contains such as have their leaves and the ends of the branches bent downwards.

The second division of this series of the *hypnum*, takes in those which are squamose and denuded; a first subdivision of these also is established, to comprehend such as have their leaves standing out, whether broad or narrow.

The second subdivision of these *hypnum*, comprehends those whose leaves being closely applied to the stalks, give them a cylindric figure.

The third division of this order of *hypnum*, comprehends those called the *trichodes* and filix ones; these have extremely fine and small leaves, placed in the manner of scales, one over another.

The second order of the *hypnum* contains those with pendulous heads.

The third order of the *hypnum* contains a number of species less known than the others, and about which there is some doubt among authors, whether they are truly *hypnum*, and regularly distinct from the others.

All these last are described by Ponteder, but imperfectly; and both they, and many of Mitchell's, probably belong to some of the before mentioned species; but as they want in the descriptions and figures the distinguishing characters of the species, Dillenius has prudently avoided determining any thing about them. *Ibid.* p. 312.

HYPO, *ὑπο*, a Greek particle, retained in the composition of divers words borrowed from that language; literally denoting *under*, *beneath*—In which sense it stands opposed to *hyper*, *supra*, above.

HYPOBOLÆ, from *ὑπο*, and *βολα*, *I cast*, or *subjection*, in *Rhetoric*, a figure so called, when several things are mentioned, that seem to make for the contrary side, and each of them refuted in order. This figure, when complete, consists of three parts; a proposition, an enumeration of particulars with their answers, and a conclusion. Thus Cicero, upon his return from banishment, vindicates his conduct in withdrawing so quietly, and not opposing the faction that ejected him. *Pro. Dom. cap.* 35.

HYPOCATHARSIS, *ὑποκαθάρσις*, compounded of *hypo*, *under*, and *καθάρσις*, *I purge*, in *Medicine*, a too faint or feeble purgation.

HYPOCAUSTUM, *ὑποκαύστω*, formed of the preposition

tion *pass*, *unio*, and the verb *pass*, *I burn*, among the Greeks and Romans, was a subterraneous place, wherein was a furnace that served to heat the baths.—Vitruvius calls it *CALDAIUM*.

The ancients had properly two sorts of *hypocausta*; the one called by Cicero *expansiles*, and by others *luminis* or *fuliginis*, which was a large heating bath, in which were three brazen vessels called *calidarium*, *tepidarium*, and *frigidarium*, according to the water contained therein.

The other *hypocaustum* was a sort of *stove* or oven to heat their winter parlours, or *caveatuncula hybernæ*.

The latter *hypocaustum* was called *stove* and *stove*; and the man that tended the fire, *stoveur*. See *BATHS*.

The remains of a Roman *hypocaustum*, or sweating room, were discovered under ground at Lincoln, in 1739. We have an account of their remains in the Phil. Trans. N° 461. sect. 29. See *Abr.* vol. ii. p. 455.

HYPOCAUSTUM, among the moderns, is that part or place where the fire is kept that warms a *stove*, or *hot-house*.

HYPOCHARIS, in Botany, the name of a genus of plants of the *pentagynæ polytricha aquatica* class; the characters of which are these: the common cup is of an imbricated figure, and is felled at the base, and composed of sharp-pointed scales; the flower is of the compound kind, it is imbricated and uniform; the separate flowers of which this is composed are numerous, and equal in size; each is composed of one leaf, and is narrow, of a egg-shaped shape, truncated, and divided into five segments at the edge; the laminae are five very short and capillary filaments; the anthers are cylindrical and tubular; the germens of the pistil stands under the flower; the style is capillary, and of the length of the filament; the stigmata are two in number, and are reflex, the cup, after the flower is fallen, serves as a seed-vessel, its scales close at the top, and it becomes of a roundish but pointed figure; the seeds are single and oblong, and terminate in a subulate and papillose stalk; the receptacle is beset all over with little fleshy substances; these are of the length of the seeds, and are placed between them. Linnæus makes this genus comprehend the *hypocharis* and the *achrophorus* of Vaillant: the only difference between which is, that the *hypocharis* has a roundish cup all over imbricated, and a plumose down upon the seeds; whereas the *achrophorus* has an oblong cup, which is imbricated only at the base, and a simple down on the seed.

HYPOCHONDRIA, *Trochanter*, composed of the preposition *hypo*, under, and *condria*, cartilages; q. d. *cartilaginei fulcrum*, or under the cartilages of the ribs, &c. in *Anatomy*, a space on each side the epigastric region, or upper part of the lower belly. See *ANATOMY*, and *EPIGASTRIC*. The *hypochondria* compose the upper part of the epigastrium. They are fringed on each side, between the cartilago eniformis, the cartilages of the ribs, and the tip of the breast, and are divided, with respect to their situation, into *right* and *left*.

In the *right hypochondrium* the liver is found; and in the *left* the spleen, and a great part of the stomach.

Hippocrates sometimes uses the word *hypochondrium* for the whole lower venter or belly.

The *hypochondria* are subject to divers disorders.

HYPOCHONDRIAC afflicto, or *passio*, in *Medicine*, a popular disease, otherwise called the *pleth*, *vapour*, &c. is a spasmodic, flaccid affection of the stomach and intestines, arising from an irregularity of the peristaltic motion, caused by the stagnation of the blood and vital fluids, between the nervous and muscular coats of the intestines.

The *hypochondriac* is a very comprehensive disease: it is variously denominated, according to the various symptoms it is attended with, and the various parts where it is supposed to be seated, or in which it arises.

When conceived as a disease in the *hypochondriac* regions, or arising from some disorder of the parts contained therein, viz. the spleen, liver, &c. it is properly called the *hypochondriac afflicto*, *pleth*, &c.

When conceived as owing to some disorder of the womb, it is called the *HYSTERIC afflicto*, &c.

And lastly, when the flaccid ramblings in the intestines, belchings, &c. are confidered, it is called the *VAPOURS*.

The *hypochondriac* is a very common and very obstinate disease: few men of a sedentary life, and fewer women are free from it. It becomes daily more common in this country, owing, without doubt, to the increase of luxury, and sedentary employments. Its symptoms are very numerous: the most usual are, a pain in the stomach, windiness, colicness, vomiting, a swelling or distention of the *hypochondrium*, or upper part of the belly, noises and ramblings in the lower venter, wandering pains, a constriction of the breath, difficulty of breathing, palpitation of the heart, faintings, vigilie, inquietudes, swimming of the head, fear, suspensions, melancholy, deliriums, &c. Not that all these accidents befall every per-

son seized with this disease; but sometimes some of them, and at other times others, according to the constitution, &c. of the patient.

In effect, the *hypochondriac* is a very vague indeterminate sort of disorder. Dr. Sydenham observes that its symptoms are or emulate those of most other diseases; and that whatever part it is in, it produces something like the common diseases of that part.—Thus, in the head it produces a sort of apoplexy; fits like the epilepsy, called *hysterici fits*; intolerable head-ach, &c. In persons affected with the chlorosis, it produces a palpitation of the heart; sometimes, though rarely, it seizes the lungs, and causes a continual dry cough; it also imitates the colic, and iliac passion, and sometimes the flux, jaundice, &c. In the intestines it produces a diarrhoea; in the stomach, nausea; sometimes it seizes the external parts, and particularly the back, which it renders chills and painful, and the legs and thighs, which it twells so as to resemble the dropsy; itching the teeth, it resembles the scurvy (indeed, Lempius makes the scurvy itself to be only a great degree of this disease). Lastly, which is the most unhappy circumstance of all, the patient is sometimes more affected in mind than in body.

The primary seat of this disease is in the stomach and bowels, though it sensibly affects the animal spirits, and the nervous system. To this purpose Hoffman says that the peristaltic motion in the bowels is retarded by spasm. By some its cause is referred to an acid fermenting in the mass of blood; to which the ill disposition of the stomach, and the other parts contained in the epigastrium, may greatly contribute. Purged acridities crudities and indigestions are the prime cause. According to Sydenham, vehement emotions of the body, or more usually violent perturbations of the mind, as grief, anger, fear, &c. are its proximate causes. It is usually brought on by long and serious attention to abstruse subjects, grief, the suppression of customary evacuations, excess of venery, the repulsion of cutaneous eruptions, long continued evacuations, obstructions in some of the viscera, as the liver, spleen, &c. In some there is an habitual disposition to this disorder, and such people have generally a fallow or brown complexion, and a downcast look. Whatever may give rise to nervous disorders in general, may be a cause of this in particular. There will be always more or less subject to this disorder, whose stomachs generate acridities from fermentation, or where there is a putrefactive disposition in the alimentary solids and fluids, the gas, separated by either of these causes, is suddenly diffused, and contributes to repel the vital heat, wherever it is present in any considerable degree.

It is observable, that persons subject to this disorder very rarely fall into continued, epidemic, or contagious fevers, and even escape the plague, and remain free from any other disorders. Hoff. Oper. tom. iii. p. 65.

This disorder is confounded by Sydenham and others, with *HYSTERIC*; but Hoffman insists that the difference is considerable, and deserves to be attended to in practice.

For the cure, the principal indications are to correct the vicious cause in the stomach, to strengthen the alimentary canal, to increase the vital heat, and to promote the secretions, which is to be effected, after proper evacuations, by occasional emetics and purges, by chalybeates, bitters, strengtheners, and volatile spirits. The different preparations of iron, and the Peruvian bark, have considerable virtues in this disease. When the patient is costive, two, three, or four pills, composed of equal parts of aloes, rhubarb, and assa fetida, with a sufficient quantity of the elixir proprietatis, may be taken occasionally, to keep the body gently open. Those who cannot bear the assa fetida may use Spanish soap.

Hypochondriac persons ought never to fast long, and their food should be solid and nourishing; they should avoid all accecid and windy vegetables. Fleish meats are most proper, and their drinks should be old claret or Madeira, or water with a little brandy or rum; but every kind of excess is hurtful. They should be careful to use every method for preserving cheerfulness and serenity of mind. Exercise of every kind, particularly riding, is useful. The cold bath is likewise beneficial; and where this does not agree with the patient, friction with a flesh-brush, or a coarse cloth, may be tried. A voyage, or a long journey, especially towards a warmer climate, will be of greater service than any medicine. Buchan's Dom. Med. p. 491, &c. ed. 1776. See *NERVOUS Diseases*.

HYPOCHONDRIACAL medicines, are remedies proper in the *hypochondriacal* disease.

Such are all those which tend to purify the blood, humours, and spirits; as chervil, bism, serimony, St. John's wort, and the other cephalic and cardiac herbs: such also are those which purge melancholy, or atrabilia, according to the old authors, and those which disperse wind and vapours; and all medicines good for disorders of the nerves.

netes, particularly vermin, both male and female; but above all, frequent, gentle, and moderate purges are excellent. See the preceding article.

HYPOCHONDRIACAL regime. See **HYPOCHONDRIA**.

HYPOCHYMA, or **HYPOCHYTES**, *ὕψωμα*, literally denoting *shading, effusion, or pouring out*, the diffuse having formerly been supposed to arise from an effusion of some vital humour upon the pupil, in *Medicine*, a disease of the eye, more usually called a *CATARACT*.

HYPOCISTIS, *ὑπόκιστος*, formed of *ὑπο*, under, and *κιστός*, in *Medicine*, a juice used in the composition of theriacs, &c.

The *hypocistis* is the juice of a shoot or excrecence of the same name, growing out from the foot of a kind of cistus, or rock-rose, which is called *Idon* or *Idasijera*; common enough in the hot countries.

The shoot grows about three or four inches high, and one, two, or three inches thick; and is somewhat larger at top than at bottom; and is soft, succulent, of a yellowish colour, and surrounded from space to space with a sort of rings, or brownish knots. It bears a number of little bell-shaped flowers, but no leaves.

When gathered, they pound it in a mortar, and express the juice; that done, they evaporate it on the fire till it come to the consistence of a hard blackish extract, much like Spanish liquorice; then they make it up into little masses for carriage. It is a mild astringent, of no particular smell or flavour, and recommended for stopping fluxes of the belly, vomitings, and hemorrhages; though anciently much more than at present. It is also an ingredient in some emetics.

It is sometimes used as a substitute to acriis. — Dr. Quincy says, it is the more powerful astringent of the two.

HYPOCRAS. See **HYPOCRAS**.

HYPOCRATERIFORMIS, *ὑπόκρατης*, in *Botany*, the name given by Mr. Tournefort to a peculiar sort of flowers or plants, of the general order of the *ORCHACEAE*; but not so deep and narrow at the mouth as those simply so called, but expanded into the figure of a saucer.

HYPOCRINE, or **HYPOCRINE**. See **HELICON**.

HYPOCRIST, *ὑπόκριτος*, in *Elhiol*, denotes dissimulation with regard to the moral or religious character.

HYPODIACONORIUM *sejūm*. See **VALANDARIUM**.

HYPODORIAN, in *Antient Music*, is the seventh of all the modes. It is fundamental is a fourth below the Dorian mode.

HYPODROME. See **HYPODROME**.

HYPODOLIAN, in *Antient Music*, one of the Greek modes, called by Euclid *hypodolion*. Its fundamental is a fourth above the *mixolydian*.

HYPOGEUM, *ὑπόγειον*, formed of *ὑπο*, under, and *γειον*, earth, in the *Antient Architecture*, is a name common to all the parts of a building that are under ground; as the cellar, bunker, and the like places.

The first *hypogeum* was used by the Greeks and Romans for subterraneous tombs in which they buried their dead.

HYPOGEUM, *ὑπόγειον*, in *Astronomy*, is a name given to the celestial bodies which are below the horizon; and especially the *moon*, or, bottom of heaven.

HYPOGASTRIC *sejūm*. See **HYPOGASTRIUM**.

HYPOGASTRIC *sejūm*, is an artery arising from the *ilaca interna*, and distributed to the bladder, the rectum, and the genital parts, particularly in women.

HYPOGASTRIC *sejūm*, is in the same parts, and discharges itself into the *ilaca interna*.

HYPOGASTRIUM, formed of *ὑπο*, under, and *γαστρ*, belly, in *Anatomy*, the lower part of the abdomen, or lower venter; commencing from two or three inches below the navel, and extending to the os pubis.

HYPOGLOSSI, *ὑπογλωσσίδες*, or *glossarii*, are the ninth pair of nerves, called also *glossae* or *glossarii*. They have their origin just above the foramen magnum, and go out at the sides of the same great hole, above the condyles of the occipitals. As soon as they are pulled out of the cranium, they run betwixt the carotid artery and the internal jugular vein, to the tongue, on the side of the digastric muscle.

HYPOGLOTTIS, or **HYPOGLOTTIS**, composed of *ὑπο*, under, and *γλωττις*, throat, in *Anatomy*, is a name given to two glands of the tongue.

There are four large glands of the tongue, two of them called *hypoglossides*, situated under it, near the *vein ramosa linguis*; one on each side of the tongue. They serve to filter a kind of ferrous matter, of the nature of saliva, which they discharge into the mouth by little ducts near the gums.

HYPOGLOTTIS, or **HYPOGLOTTIS**, in *Medicine*, denotes an inflammation or ulceration under the tongue; called also *sejūm*.

HYPOIONIAN, in *Antient Music*, the second of the Greek modes, called by Euclid *hypionian*, and *cratichyphorian*. Its fundamental is a fourth below the *Ionian*.

HYPOLYDIAN, in *Antient Music*, a mode which is a fourth below the *Lydian*.

HYPO-MIXOLYDIAN, in *Antient Music*, a mode said to be added by Guy d'Arrezzo. Its fundamental is a fourth above the *Mixolydian* or *Dorian*.

HYPOMNEMATOGRAPHUS, *ὑπομνηματογράφος*, derived from *ὑπο*, under, register, and *γραφο*, I write, in the *Primitive Courts*, an officer who attended on the bishop, and kept a register of his consecrations.

HYPOMOCHLION, *ὑπομόχλιον*, formed of *ὑπο*, under, and *μόχλιον*, lever, in *Mechanics*, the fulcrum of a *LEVER*; or the point which fulfills its pressure, when employed either in raising or lowering bodies.

The *hypomochlion* is frequently a roller set under the lever; or under stones, pieces of timber, &c. that they may be the more easily lifted up, or removed.

HYPONTIS, in *Botany*, a name given by Billenius to a genus of plants, called by Tournefort *iridobombus*. See **MONOTRACHA**.

HYPOPHORA, *ὑπόφορα*, in *Rhetoric*, the last part of the *PROCESSION*; thus, in the following instance: *But first, how will you, how are the dead raised, or with what body do they come?* is the *hypophora*; and, *then, first, that which thou sayest*, &c. is the *antiphrasis*, or solution of the objection.

HYPOPHORA, from *ὑπόφορα*, I am conveyed away, in *Surgery*, is used for a deep fistulous ulcer.

HYPO-PHYGIAN, in *Antient Music*, the sixth species of the *Dorian*.

HYPOPHthalmion, denotes that part under the eye which is subject to swell in a *caruncle* or *drop*.

HYPOPHthalmion, in *Botany*, a name used by some authors for the *officinal*.

HYPOPHYLLISPERMUS plants, formed of *ὑπο*, under, *φυλλ*, leaf, and *σπερμος*, seed, are such plants as bear their seeds on the back-sides of their leaves.

HYPOPODIUM, in *Anatomy*, a piece of furniture belonging to the bath; its use was to sit or rest the feet on; at the same imports.

HYPOPROSLAMBANOMENOS, in *Music*, the name of the chord added by Guido Arstino, before the *presbiter* of the Greek scale, answering to our *D*. See **DIATRAMA**.

HYPOPYON, *ὑπόπυον*, formed of *ὑπο*, under, and *πυον*, pus, in *Medicine*, a distillate of the eye. It consists in a collection of pus under or behind the cornea, which sometimes covers the whole pupil, and obstructs the sight.

Some will have this disorder the same with *argus*; but the more accurate make a difference.

The *hypopyon* arises from a rupture of the vessels in the cornea, occasioned either by force external violence, or the acrimony of the blood therein.

In the beginning, it is attended with acute pain in the head and eye; and according to the degree of this disorder, it is followed by dimness of sight, blindness, or death. It is very difficult of cure. — The *hypopyon* is to be prevented by proper cautery; or, if these will not take effect, it is to be promoted.

The cure of this distemperment of the eyes is sometimes effected by violently shaking the head. The ancients used this practice as an approved remedy; and accident has shown it to be often successful (still) the jolting of a chariot, in a long journey, having been known to remove the disorder, by making the purulent matter subside behind the uvea. This method of shaking ought, therefore, always to be made the first attempt, to give relief in this case, disposing the patient's head in a supine posture and pressing the eye before-hand with the fingers, in order to remove, or at least loosen the matter. In the beginning of the disorder the cure may be attempted by resolvent medicines, such as a frequent application of a decoction of sage in wine, with bleeding and purging. But if these attempts prove unsuccessful, the necessary operation must be performed. The patient must be fixed against the light, with his head and hands firm; secured by an assistant. The surgeon is then to depress the lower eyelid, while the assistant elevates the upper; and the surgeon is then with a lancet to incise cautiously through the cornea, below the pupil, making the opening large enough to discharge the matter, with the aqueous humour; but taking great care not to wound the uvea behind the pupil. About three or four hours afterward the eye must be dressed with a compress, dipped in a collyrium of rose-water, white of eggs, miltedge of quince seeds, and a little camphor; and by this means the wound in the cornea will be healed, the aqueous humour will be restored, and if none of the internal parts are injured, the patient will recover his sight. Heister.

HYPORCHEMA, formed of *ὑπό*, under, and *σχημα*, I accommodate my dwelling to a *fixing* thing, of *ὑπο* and *σχημα*, I dwell, in the *Greek Poetry*, a poem composed of divers kinds

kinds of verses, and of different lengths: but always very short, and full of Pyrrhic feet. This poem was composed either to be sung or played with the flute or cithara, but to regulate a dance according to the found of voices and instruments. Proclus says, it was a dance accompanied with a song.

HYPOSCENIUM, *ὑποσκήνιον*, in *Antiquity*, a partition under the pulpit or logeum of the Greek theatre, appointed for the music.

HYPOSCHESES, *ὑποσχέσεις*, in *Rhetoric*, the same with *DICTION*.

HYPOSPADIAS, in *Surgery*, from *ὑπο*, under, and *σπας*, I draw, a Greek name anciently given to a person, who had the orifice of the canal of the ureter not directly at the extremity of the gland. Galen applies the same name to those the freum of whose penis is too short, on which account it is bent in erection; this is easily remedied by cutting the ligament, and washing the wound with warm wine.

HYPOSPATHISMUS, in the *Ancient surgery*, an operation practised, by making three incisions in the forehead, to the very bone, about two inches long; in order to cut or divide all the vessels between those incisions. The design of the operation was to prevent defluxions on the eyes.

The word is *ὑποσπάθισμος*, formed of *ὑπο*, under, and *σπάθω*, *spatula*, by reason after incisions were made they thrust a spatula all along between the pericranium and the flesh.

HYPOSPASIS, *ὑποσπασίς*, compounded of *ὑπο*, under, and *σπασίς*, I stand, I exist, q. d. *subsistens*, a Greek term, literally signifying *sublimis*, or *sublimity*; it is used in theology for *perfection*.

Thus some have held, that there is but one nature or essence in God, but three *hypostases*, or persons.

The term *hypostasis* is of a very ancient standing in the church. St. Cyril repeats it divers times, as also the phrase *union according to hypostasis*. The first time it occurs in all Christian antiquity, is in a letter of that father to Nestorius, where he uses it instead of *apocryphum*, the word we commonly render *person*, which did not seem expressive enough. The philosophers, says St. Cyril, have allowed three *hypostases*: they have extended the divinity to three *hypostases*: they have even sometimes said 'the word trinity'; and nothing was wanting but to have admitted the consubstantiality of the three *hypostases*, to shew the unity of the divine nature, exclusive of all 'trinity in respect of distinction of nature, and not to hold it necessary to conceive any respective inferiority of *hypostases*.

This term has occasioned great diffusions in the ancient church; first among the Greeks, and afterwards also among the Latins.

In the council of Nice, *hypostasis* was defined to denote the same with *essence*, or *substance*; so that it was barely to say that Jesus Christ was of a different *hypostasis* from the Father; but custom altered its meaning. See *TRINITY*.

HYPOSTASIS, in *Medicine*, the sediment of the urine, or that thick heavy part of the urine, which subsides and settles at bottom.

HYPOSTATICAL, in *Theology*, is a term used in speaking of the mystery of the incarnation.

Hypostatical union, is a phrase used by some divines for the union of the human nature with the divine in the person of Jesus Christ.

HYPOSTATICAL principles, among the *chemists*, and particularly the *Paracelsists*, are the three chemical elements, *fire*, *sulphur*, and *mercury*; called also the *tria prima*. See *PRINCIPLE* and *ELEMENT*.

HYPOTHECA, in the *Civil Law*, an obligation, whereby the effects of a debtor are made over to his creditor, to secure his debt.

The word comes from the Greek, *ὑποθήκη*, a thing subject to some obligation; of the verb *ὑποτίθημι*, *hypothetis*, I am subjected; of *ὑπο*, under, and *τίθημι*, *pono*, I put.

As the *hypotheca* is an engagement procured on purpose for the security of the creditor, various means have been made use of to secure to him the benefit of the convention. The use of the pawn or pledge is the most ancient, which is almost the same thing with the *hypotheca*: all the difference consisting in this, that the pledge is put into the creditor's hands: whereas, in a simple *hypotheca*, the thing remained in the possession of the debtor. It was found more easy and commodious to engage an estate by a civil covenant than by an actual delivery: accordingly, the expedient was first practised among the Greeks; and from them the Romans borrowed both the name and the thing: only the Greeks, the better to prevent frauds, used to fix some visible mark on the thing, that the public might know it was *hypothecated*, or mortgaged by the proprietor; but the Romans, looking on such advertisements as injurious to the debtor, forbade the use of them.

VOL. II. N^o 180.

The Roman lawyers distinguished four kinds of *hypotheca*: the *conventional*, which was with the will and consent of both parties: the *legis*, which was appointed by law, and for that reason called *causa*, the *pretor's pledge*, when by the slight or non-appearing of the debtor, the creditor was put in possession of his effects; and the *judicial*, when the creditor was put in possession by virtue of a sentence of the court.

The *conventional hypotheca* is subdivided into *general* and *special*. The *hypotheca* is *general*, when all the debtor's effects, both present and future, are engaged to the creditor. It is *special*, when limited to one or more particular things.

For the *causa hypotheca*, the civilians reckon no less than twenty six different species thereof.

HYPOTHECATE, from the Latin, *hypotheca*, a *pledge*: to *hypothecate* a ship, is to pawn the same for necessaries; and a matter may *hypothecate* either ship or goods, for relief when in distress at sea. For he represents the traders as well as the owners; and in whose hands foster a ship or goods *hypothecated* come, they are liable. 1 Saik. 24. a Litt. Abr. 95.

HYPOTHENAIL, compounded of *ὑπο*, sub, and *θηναί*, the hollow of the hand, in *Anatomy*, the second muscle of the little finger.

The *hypothenus* arises from the little bone of the carpus, situate over the others, and is inserted externally into the first bone of the little finger, which it serves to withdraw from the rest.

The sixth and last muscle of the toes is also called *hypothenus*, or *abductor*.

HYPOTHENUSE, or rather, **HYPOTENUS**, *ὑποθένη*, *subtenens*, formed of *ὑπο*, under, and *θένη*, I sustain, in *Geometry*, is the longest side of a right-angled triangle; or that side which subtends, or is opposite to, the right angle.

Thus in the triangle KML (Tab. *Geometry*, fig. 19) the side ML, opposite to the right angle K, is called the *hypotenuse*.

It is a celebrated theorem in geometry, that in every rectilinear right-angled triangle, as KML, the square of the *hypotenuse*, ML, is equal to the squares of both the other sides, KL and KM. This is particularly called the *Pythagorean theorem*, from its inventor Pythagoras, who is said to have sacrificed a whole hecatomb to the Muses, in gratitude for the discovery.

HYPOTHESES, *ὑποθέσεις*, formed of *ὑπο*, under, and *θέσις*, *positio*, of *thesis*, *pono*, I put, in *Logic*, is a proposition or principle which we suppose, or take for granted, in order to draw conclusions for the proof of a point in question.

In disputation they frequently make false *hypothesis*, in order to draw their antagonists into absurdities; and even in geometry, truths are often deducible from such false *hypothesis*.

Every conditional or hypothetical proposition may be distinguished into *hypothesis* and *thesis*: the first reherces the conditions under which any thing is affirmed or denied; and the latter is the thing itself affirmed or denied.

Thus, in the proposition, a triangle is half of a parallelogram, if the bases and altitudes of the two be equal; the latter part is the *hypothesis*, if the bases, &c. and the former the *thesis*, a triangle is half a parallelogram.

In strict logic, we are never to pass from the *hypothesis* to the *thesis*: that is, the principle supposed must be proved to be true, before we require the consequence to be allowed.

HYPOTHESES, in *Physics*, &c. denotes a kind of system laid down from our own imagination, whereby to account for some phenomenon or appearance of nature.

Thus we have *hypothesis* to account for the tides, for GRAVITY, for MAGNETISM, for the DEVIATION, &c.

The real and scientific causes of natural things generally lie very deep: observation and experiment, the proper means of arriving at them, are in most cases extremely slow; and the human mind is very impatient: hence we are frequently driven to feign or invent something that may seem like the cause, and which is calculated to answer the several phenomena, so that it may possibly be the true cause.

Philosophers are divided as to the use of such fictions or *hypothesis*, which are much less current now than they were formerly. The latest and best writers are for excluding *hypothesis*, and standing wholly on observation and experiment.

Whatever is not deduced from phenomena, says Sir Isaac Newton, is an *hypothesis*; and *hypothesis*, whether metaphysical or physical, or mechanical, or of occult qualities, have no place in experimental philosophy. Phil. Nat. Prin. Math. in Calce.

The Cartesians take upon them to suppose what affections in the primary particles of matter they please; just

what figures, what magnitudes, what motions, and what situations, they find for their purpose. They also feign certain unseen, unknown hums, and endue them with the most arbitrary properties; give them a faculty which enables them to pervade the pores of all bodies, and make them agitated with the most unaccountable motions. But is not this to set aside the real constitution of things, and to substitute dreams in their place? Truth is scarcely attainable even by the surest observations; and will fanciful conjectures ever come at it? They who found their speculations on *hypothesis*, even though they argue from them regularly, according to the strictest laws of mechanics, may be said to compose an elegant and artful fable; but it is still only a fable. Cotes in *Præfat.* ad *Newton*. Princip.

HYPOTHESIS is more particularly applied, in *Astronomy*, to the several systems of the heavens; or the divers manners wherein different astronomers have supposed the heavenly bodies to be ranged, moved, &c.

The principal *hypothesis* are the Ptolemaic, Copernican, and Tychoenic.

The Copernican is now become so current, and is so well warranted by observation, that the retainers thereto hold it injurious to call it an *hypothesis*.

HYPOTHETICAL *proposition* and *syllogism*. See *CONDITIONAL*.

HYPOTRACHELON, from *hypo*, under, and *trachelos*, neck, in *Anatomy*, denotes the lower part of the neck.

HYPOTRACHELION, in *Architecture*, is used for a little frieze in the Tuscan and Doric capital, between the atragal and annulets, called also the *elæria* and *gorgeira*.

The word is also applied by some authors, in a more general sense, to the neck of any column; or that part of the capital thereof below the atragal.

HYPOTYPOSIS, or *Imagery*, *Typosis*, formed of the verb *typosis*, *per figuram demittere*, I show, represent, or make any thing be seen; of *hypo*, under, and *typos*, type, image, resemblance, in *Rhetoric*, a figure whereby a thing is described or painted in such strong and bright colours, that it does not seem to be read, or heard, but actually seen, or presented before the eyes.

Such is that elegant one of Cicero, wherein he paints the barbarity of Verres: *Isle infamatus fletu & furore, in feram venit. Ardebat acule; ita ex ore credidit emanat. Exultabant omnes qui tandem progressuri, aut quidem affectu effecti, cum repente hunc in corpore, atque in feris multis nudari se deligari, & virgis exasperari viderent.* *Comment. de arte oratoria lib. 2. Romanum*, &c. Such is also the picture which he has drawn of Cataline, consisting of an unaccountable mixture of contrary qualities. *Pro Cato*, c. 5.

The *hypotyposis* is frequently used by the poets, and particularly Virgil, who abounds in paintings.

This figure is peculiarly suited for drawing characters, and often affords the finest ornaments in poetry and history, as well as oratory. It is also adapted to move and interest different passions, according to the nature of the subject, and the artful management of the speaker.

HYPOMIS, in *Botany*, a genus of the *hectaria mangonia* class: the corolla is permanent, and divided into six segments; the capsule is narrow at the base; and the calyx is a double-valved glume.

HYPOMOMA, in *Anatomy*, a name given to such membranes as separate two cavities.

In this sense the mediastinum is an *hypomoma*.

HYPOMOLOGOSSUS, in *Anatomy*, the same with *lophoglossus*. See also *HYPOGLOSSUS*.

HYPOMOIODES, in *Anatomy*. See *HYOIDES*.

HYPOMOTARI, *HYPMOTARIAN*, *Hypanis*, formed from *hypo*, *hypo*, a sect of heretics in the fourth century; thus called from the profession they made of worshipping the most High God.

The doctrine of the *Hypomotari* was an assemblage of Paganism, Judaism, and Christianity. They adored the most High God with the Christians; but they also revered fire and lamps with the Heathens; and observed the Sabbath, and the distinction of clean and unclean things with the Jews.

The *Hypomotari* bore a great resemblance to the *Euchites*, or *Masaliari*.

HYSSOP, in *Botany*, a genus of the *dianthia gymnospermia* class. Its characters are these: the empalement of the flower is cylindrical and permanent; the flower is of one petal of the graining kind, with a narrow cylindrical tube; the chaps are inclining, the upper lip is short, plain, roundly erect, and indented at the top; the lower lip is trifid; it has four flumina, which stand apart, two of which are longer than the petal, and the other two shorter; and four germins, which afterwards become so many oval seeds sitting in the empalement. Miller enumerates five species. The name *hyssop* is derived from the Hebrew *חִיִּשׁוֹן*, signifying a *holy herb*, or for purifying holy places; though it is generally

thought that the *hyssop* of scripture is our winter savory, which is most used in Eastern countries for outward washings or purification.

The several species of *hyssop*, when not in flower, may be known by their long narrow leaves, and their peculiar agreeable smell.

All the sorts of this plant, the common as well as the more scarce, are propagated by seeds or by cuttings. The seeds must be sown in March, on beds of a light sandy soil, and when the plants are come up, they must be transplanted to the place where they are to remain, at the distance of a foot asunder every way; or if they are intended to remain many years, they should be left at two feet distance, for they grow quick, and spread very much. They thrive best on a poor dry soil, and will bear the severities of winter much better on such a soil than on a richer. When they are to be propagated from cuttings, it is to be done in April or May, in a border where they may be defended from the violent heat of the sun, and being frequently watered, they will take root in two months, after which they may be transplanted to the places where they are to remain, managing them as the seedling plants.

The common *hyssop* of the shops with blue spikes, is of a detergent cleaning quality, and chiefly used as an attenuant, corroborant, and expectorant, in diseases of the breast and lungs. In these cases, infusions of the leaves, which are not unpalatable, may be sweetened with honey or sugar, and drank as tea. It is a standing ingredient in pectoral apozemes. There are also a syrup and a simple distilled water from it, used in the shops. The leaves give out their active matter both to water and rectified spirit; the watery infusions are of a brownish or greenish yellow, and the spirituous tinctures of a blackish green colour. On inspissating the latter, the remaining extract retains its flavour, is bitterish, and very warm, and discovers a penetrating pungency resembling that of camphor. An essential oil is obtained from distillation of the fresh herb, which rises to the surface, to the quantity of about an ounce from six pounds of the leaves.

It has also a faculty to comfort and strengthen, and is prevalent against melancholy and phlegm. Its tops and flowers, reduced to powder, are by some referred to fire upon the colder lallid herbs.

Hyssop is greatly commended in cases of bruises from falls, blows, &c. used externally by way of cataplasm, or only a little bundle of the plant sewed up in a linen rag, and applied to the part. Ray gives an account from Mr. Boyle, of a violent contusion of the thigh, from a kick of a horse, which was happily cured by this herb, boiled and applied as a cataplasm. He tells us, the violent pain was almost instantly removed, and the very mark and blackness taken off in a few hours.

Among the Jews, a bunch of *hyssop* could only be used to sprinkle the door-posts and thresholds of their houses with the blood of the paschal lamb. See *PASCHER*.

HEDGE-HYSSOP, *gratiola*, in *Botany*, a genus of the *dianthia mangonia* class. Its characters are these: the flower has a permanent empalement cut into five parts; it hath one petal of the graining kind, cut at the top into four small segments; it has five awl-shaped flumina, and two others which are longer, and adhere to the tube of the petal; in the centre is situated a conical germ, which becomes an oval capsule ending in a point, having two cells filled with small seeds. There are three species.

Mr. Geoffroy has observed, that the leaves of this plant are a very strong purge, and that in the dry extract, a method he is very fond of, for extracting the virtues of many medicines, a brisk purge may be prepared from the *gratiola*, which operates in a small dose, and without any disagreeable taste. The manner of preparing it is this: the leaves are to be infused in water, till they have communicated their virtue to it by the means of heat, and this liquor is to be evaporated over a balneum Mariæ to a perfect driness; when it leaves a dry pulverulent extract, that operates in a dose of eight or ten grains.

This is a very rough purgative; it often operates by vomits as well as by stool, and carries off a great quantity of water in dropical cases. It also destroys worms, and opens obstructions of the viscera. Its operation, however, is so violent as to be only fit for persons of robust constitutions. The *gratiola* is usually given in decoction in water or ale, half a handful being a sufficient dose for a very strong man. Its operation is rendered more mild by being boiled in milk, and the decoction drank. It purges very well in the form of clysters, but care must be taken not to give it when the bowels are in an inflamed state.

Externally it is said to be a vulnerary, a cataplasm of the bruised herb being sometimes applied to wounds with success.

HYSSOP.

HYSSOP, *Mentha*. See THYMBRA.

HYSSOPIC *Ara*, a name which Paracelsus gave to chemistry, considered as that which purifies metals, minerals, &c. in allusion to that text in the Psalms, "Purge me with hyssop, and I shall be clean."

HYSTERA, a term used by some of the old writers in medicine to express the secundines.

HYSTERALGY, compounded of the Greek *hyspa*, womb, and *algos*, pain, in *Medicine*, a pain in the matrix or womb, occasioned by some inflammation, or other disorder therein.

HYSTERIC *affliction*, or *hysteria*, formed of *hyspa*, womb, a disease in women, called also *spasmus of the womb*, and vulgarly *fit of the milks*. It is a spasmodico-convulsive affection of the nervous system, proceeding from the womb, and raised by the retention or corruption of the blood and lymph in its vessels; and more or less infecting the nervous parts of the whole body, by means of the nerves of the os sacrum, the loins, and the whole spinal marrow.

Hysteria affliction is generally used by authors promiscuously with *hypochondriac affliction*; the two diseases being supposed to be in reality the same. They only differ indeed in point of relation and circumstance.

The *hysteria* is properly a species or branch of the hypochondriac, peculiar to women, and supposed to arise from some disorder of the womb.

One of the symptoms, or effects of hypochondriac diseases is, convulsions, or fits, not unlike those of the epilepsy; these we call *hysteria fits*; and the disease that produces them *hysteria affliction*.

It is also particularly denominated *hysteria suffocation*, from one of its principal symptoms, which is a contraction of the breast, and a difficulty of breathing.

Some women under this disorder fancy a rope tied about their neck ready to strangle them; and others think a piece of something is got into their throats, which they cannot swallow, but which stops their breath; and some will even remain a good while as if really strangled without any sense or motion. At other times the patient is affected with catchings and convulsions. Sometimes the fits come on with coldness of the extremities, yawning and stretching, looseness of spirits, oppression and anxiety. At other times the approach of the fit is foretold by the navel being drawn inward, and feeling as if there were a ball at the lower part of the belly, which gradually rises towards the stomach, where it occasions inflation, sickness, and sometimes vomiting; and afterwards it arises into the gullet, and occasions a degree of suffocation already described, to which quick breathing, palpitation of the heart, giddiness of the head, dimness of the sight, loss of hearing, with convulsive motions of the extremities and other parts of the body, and alternate laughing and crying, convulsions, and the frequent discharge of a pale limpid urine succeed.

It is not always attended with all these symptoms, but sometimes with more, and sometimes with fewer of them, and those more or less violent.

This distemper seems to arise from congestions of blood in the abdomen, and in the viscera, situated there, which should find passage by the uterus, or the hæmorrhoidal veins, but is impeded. And as this is also the cause of the hypochondriac affections in men, it is no wonder that the generality of symptoms are the same in both, and that the method of cure must be nearly the same. It is to be observed, however, that though obstructions are the common cause of these diseases in both sexes, yet women are sometimes found afflicted with this while the menses flow properly, in due quantity, and at their regular periods. In this case, the disorder seems owing to acrid humours in the prime viæ, exciting spasms wherever they come.

Dr. Paracelsus describes an *hysteria prolym*, as beginning with a sense of coldness creeping up the back, and afterwards spreading over the whole body; then ensues a head-ach, and sometimes a palpitation of the heart, with a fainting, from which the patient soon recovers. Sometimes after the coldness, there succeeds a remarkable heat which begins on the forementioned symptoms. Baglivi adds, that *hysteria* women feel a sense of cold in the crown of the head; and this he takes to be the chief diagnostic of the disease.

The ordinary causes of this disorder are violent passions, fear, rage, love, grief, ill news, sweet smells, &c. Women of a delicate habit, whose stomach and intestines are relaxed, and whose nervous system is extremely sensible, are most subject to *hysteria* complaints. In such persons an *hysteria fit* may be brought on by an irritation of the nerves of the stomach or intestines by wind, acid humour, &c. A sudden suppression of the menses often occasions *hysteria fits*. As for the popular notion of malignant vapours arising from

the womb, and occasioning all these symptoms, all the learned discard it, and hold men as subject to the disease as women. The real cause they affirm is in the animal spirits, and the nervous system; and the affection does not differ from the hypochondriac.

For the cure; as many of the symptoms are convulsive, antispasmodics are indicated. The best of these are muls, opium, and castor. Opium, when it disagrees with the stomach, may be applied externally, or given in clysters; and it has often been found serviceable in removing those periodical headaches to which *hysteria* and hypochondriac patients are subject. See *Hystericus Crastus*. Castor has in some cases been found to procure sleep, where opium failed; and, therefore, Dr. Whytt advises to join them together; he likewise recommends the antihysterical plaster to be applied to the abdomen.

In the time of the fit, when the sensation of strangulation is violent, or there are convulsive motions or faintings, the ferid and volatile medicines serve to recover the patient: such are spirit of hartshorn, assa fetida, oil of amber, tincture of castor, and the volatile salt held to the nose, or taken internally, as also the burning of feathers, horn, or leather, or any other substance, which has a very disagreeable smell while in the fit; rubbing the hands and feet, is also of great service, and some recommend the pulling off of the hairs singly, and other methods, which give pain, to bring the patients to themselves. Hot bricks may also be applied to the soles of the feet, and the legs, arms, and belly, may be strongly rubbed with a warm cloth. But the best application is to put the feet and legs into warm water. This is peculiarly proper, when the fit precedes the flow of the menses.

Some have advised to bleed the patient during the fit; this may be proper, if the habit be plethoric, and the pulse full; but in weak and delicate constitutions, or where the disease has been of long standing, or arises from insipidity, it is not safe. In case of coliciveness, a laxative clyster, with assa fetida, should be administered; and as soon as the patient can swallow, two table spoonfuls of a solution of assa fetida, or of some cordial julep, may be given.

These are the methods to be used in the time of the fit; but when the patient is restored from that, the same method is to be used as in the hypochondriac patient; only that, in this case, a little castor is to be added to the saline and cinnabarine medicines. After this, care is to be taken to restore the menses to their proper order, if the patient be at a time of life when they ought to flow; but if that period is past, the evacuation must be, in some measure, supplied by bleeding in the foot, and repeating this every year at the spring and fall, and with this some doses of a gentle purge, with a proper regimen. Vomits are always found harmful in these cases, unless the stomach be loaded with phlegm, and when violent, are dangerous in the highest degree. Strong purges are also liable to the same objection, and are never to be modded with; but if there be a tendency to coliciveness, it must be removed either by diet, or by taking an opening pill, as often as necessary. All hot medicines are also prejudicial, and the common uterine elixirs, with the distilled oils, and volatile salts, are liable to the same objections. Some give the common terrestrial alkalies and absorbents, but they give no relief in these cases; because an acid either is no cause, or, at the utmost, is not the essential cause of these disorders.

Steel medicines are also given by many; but they are to be used with great caution; and, in general, they seldom do any good, but very often a great deal of harm. As there are, however, some cases of this kind in which they excel all other medicines, it is always proper to give them a fair trial, under the proper regulations. The most proper medicines are those which strengthen the alimentary canal, and the whole nervous system; as the preparations of iron, the Peruvian bark, and other bitters. Twenty drops of the elixir of vitriol in a cup of the infusion of the bark, may be taken twice or thrice a day. The bark and iron may be likewise taken in substance, in considerable doses.

The common chalybeate waters often prove of more service in this disease than all the medicines in the world; but they are to be taken with the proper cautions, and a due regimen. It is necessary to bleed in the foot before entering on a course of them, and then they are to be drunk in moderate quantities, and always a little warmed, using a moderate exercise during the time of drinking them. See *MINERAL-waters*.

A course of milk and vegetable diet will often perform a cure. The most proper drink is water, with a small quantity of spirits. A cool dry air is the best. Cold bathing, and every thing that braces the nerves, and invigorates the system, is beneficial; but lying too long in bed, or whatever relaxes the body, is injurious. The mind

mind should be kept constantly easy and cheerful. *Hysteria* patients are often afflicted with cramps, for the relief of which the most efficacious medicines are opium, blistering plasters, and warm bathing and fomentations. In milder cases, immersing the feet and legs in warm water, or applying a blistering plaster to the part affected, has removed the complaint. Patients, whose nerves are uncommonly delicate and sensible, and for whom the blistering plaster is not so proper, may attempt the cure by opiates, mull, camphor, and the warm bath. Cramps in the legs have been sometimes removed by tight bandages; and convulsions arising from a flatulent distention of the intestines, or from spasms beginning in them, may be diminished or cured by making a strong compression upon the abdomen with a broad belt. See CRAMP. Buchan's Dom. Med. p. 490.

HYSTERIC COLIC. See COLIC.

HYSTERICIS, or HYSTERIC medicines, are remedies proper to remove *hysteria* affection; and to remedy disorders of the womb.

There are divers species of *hysteria*: some evacuate or cleanse the womb, by expelling any impurities lodged therein; others tend to stop immoderate fluxes thereof, and others strengthen the tone of the part.

According to Dr. Quincy, *hysteria* affections arise either from too titillating, or too uneasy sensations; the former proceed from that irritation of the nerves, which the make and secretion of those parts have naturally subjected them to, and which, in some sorts of constitutions, arise to that degree, as to draw the whole system into disorder, and occasion a suprising variety of symptoms; e.g. several sorts of convulsions and species of madness; which therefore are by some termed *furor uterini*.

These disorders are most effectually allayed by such things as are in a manner the reverse of cordials, and are both in smell and taste very offensive and disagreeable: they seem to answer this end by suffocating, as it were, the spirits, and damping their inordinate sallies, so that such stimulation ceases, and the fibres return to their natural tone and motions; for, as what is grateful to the senses gives an inexpressible emotion to the fine nervous filaments, so does what is fetid and disagreeable quite destroy that emotion and deaden it; and as the former kind consist chiefly of fine subtle volatile parts, by which, as before explained under *CERPHALICA*, they are fitter to enter the nerves; so these are generally of a clammy viscidous texture, and therefore the fitter to envelope and entangle that subtle juice, whereby its motion is much retarded.

HYSTERICUS lapis, in *Natural History*, a name given to an American stone, called also *lapis uterinus*, famous for its virtues against disorders of the womb, externally applied. It is black, and capable of a fine polish.

HYSTERICUS clavus. See CLAVUS.

HYSTEROCELE, formed of *hyspa*, womb, and *cele*, tumor, in *Medicine*, an *HERNIA* caused by the uterus passing through the peritoneum.

HYSTEROLITHUS, formed of *hyspa*, womb, and *lithos*, stone, or *CUNNOLITHUS*, in *Natural History*, a stone thus called, from its resemblance to the external parts of generation of the female sex. It is very hard, of a grey or blackish brown colour, about the size of half a walnut which it resembles, being convex, and somewhat smooth on one side, and on the other side resembling the labia pudendi. This is a species of the *HELMINTHOLITHUS*, in the Linnaean system. These stones are found in great abundance near the castle of Braubach, upon the Rhine, on the confines of the landgrave of Hesse.

HYSTEROLOGY, *Ἑρπασολογία*, signifying a discourse inverted, in *Rhetoric*, a species of *HYPERBATON*, or a vicious manner of speaking, wherein the natural order of things is inverted; called also by the Greeks *ἑρπας ποτερος*; q. d. putting the first thing where the last should be.

Thus Terence uses *vult & vivit*, for *vivit & vult*. And Virgil *mariumur & in media arma ruamus*, for *in media arma ruamus & mariumur*. Quintilian exposes this fault, lib. xi. cap. 2. where he says, *quodam—turpiter convertuntur, ut si peperisse narres, deinde concepisse; in quibus, si id quod posterius est dicaris de priore tacere optimum est*.

HYSTERON-PROTERON, *Ἑρπας ποτερος*. See HYSTEROLOGY.

HYSTEROPHORUS, in *Botany*, the name of a genus of plants, described by Vaillant in the *Acta Germanica*, the characters of which are the same with those of the common *PARTHENIUM*.

HYSTEROPOTMI, *Ἑρπασποτμοί*, in *Antiquity*, the same with *DEUTEROPOTMI*.

HYSTEROTOMIA, *Ἑρπαστομία*, formed of *hyspa*, womb, and *tomos*, I dissect, in *Anatomy*, an anatomical dissection of the uterus, or WOMB.

HYSTEROTOMOTOCY, *Ἑρπαστομωτοκία*, in *Surgery*, an operation more usually called the *CÆSARIAN section*.

HYSTRIX. See PORCUPINE.

HYTH, or HITH, a port, wharf, or little haven, to embark or land wares at. Such is *Duten-bith*, &c.

I.

I, The ninth letter of the English alphabet: it is both a vowel and a consonant; agreeable to which two different powers, it has two different forms; though, since the vowel and consonant differ in their form, as well as sound, they may, as Dr. Johnson observes, be more properly accounted two letters.

The Hebrews called the *j* consonant *iod*, יוּד, from יוּ, hand and יוּד, because it is supposed to represent the hand clenched, so as to leave the space underneath void. With them it was pronounced as the consonant *y*, as it still is among the Germans, and some other people. The Greeks had no *j* consonant, and for that reason used their vowel *i* instead of it, as coming the nearest in sound. The letter *i* was used as a consonant among the Latins. In English *j* consonant has invariably the same sound with that of *g* in *plant*, and serves to mollify that of the vowels; as in *Jesus, just, Jewish*. *I* vowel varies in its sound: in some words it is long, as *fine, thin*, &c. In others short, as *fit, thin*. Preceded to *y*, it makes a diphthong of the same sound with the soft *y*, or double *ey*, as in *field, yield*, except in *friend*, which is pronounced *freind*. Subjoined to *a* or *e*, it makes them long, as *fair, night*; and to *a* makes a mingled sound, which approaches more nearly to the true notion of a diphthong, or sound composed of the sounds of two vowels, than any other combination of vowels, in the English language, as *air, vein*. The sound of *i* before another *i*, and at the end of a word, is always expressed by *y*. Johnson. The vowel *i*, according to Plato, is proper for expressing fine and delicate, but humble things: on which account that verse in Virgil,

Accipiant inimicum imbretem, remisque satiscunt,

which abounds in *i*'s, is generally admired. The vowel *i* was the only vowel which the Romans did not mark with the dash of a pen, to shew when it was long; instead of which, to denote it long, they used to make it bigger than ordinary, as in *Piss, Flous*, &c. According to Lilius, they often repeated it when it was to be long, as in *air*. They sometimes also denoted the length of this letter by adding *e* to it, and turning it into a diphthong, as *diecti* for *divi*, *amori* for *amori*, &c.

I, in *Logic*, denotes a particular affirmative proposition. *I* was anciently a numeral letter, and signified a hundred, according to the verse.

I. C. compar erit, & centum significabit.

I, in the ordinary way of numbering, signifies one; and when repeated, it signifies as many units as it is repeated times. When put before a higher numeral, it subjoins itself, as *IV, IX*, &c. but when set after it, it is added as often as repeated; as *VI, XI, VIII, XIII*, &c.

In abbreviations, and ciphers, *I* frequently represents the whole word *Jesus*, whereof it is the first letter.

I, in the *French Cennage*, characterises the money of Limoges.

JABAJAHITES, a sect among the muslimen, who, according to Ricaut, teach, that God is not perfectly wise; that his knowledge does not extend to every thing; and that time and experience have furnished him with the knowledge of many things, whereof he was before ignorant. Thus, say they, not being apprised from all eternity of every event that shall happen in the world, he is now obliged to govern it according to the chance and occurrence of those events.

JABIRU, in *Ornithology*, the name of a large water-bird approaching to the crane-kind, and called by some the *negers*. It is larger than our swan, its neck is as thick as a man's arm, and its head very large; its beak is straight, eleven fingers breadth long, pointed and a little hooked

at the end; its legs are two feet long, and thick, and, as it were, scaly; it is all over on the body white, as the swan or goose; its neck is naked, and for a long way below the head is covered, as is also the head, with a tough black skin: it is possible, however, that there naturally may be feathers on this part; but that only dead birds having been seen of this species, the feathers may have fallen off; its tail is broad and short. Margrave.

JARIRUGUACU, in *Ornithology*, the name of a Brazilian bird, called by others *nanduspos*, and by the Dutch *schryvogel*.

JABOTAPITA, in *Batavy*. See *OGINA*.

JABOTI, in *Zoology*, the name of a remarkable species of tortoise found in America. The shell of this species is black, and has many hexangular figures marked upon it; the head and legs are brown, variegated with spots of a dusky greenish hue. The liver of this species is accounted a very delicate food.

JACA, in *Natural History*, the name of a kind of nut, very common in China, which is reckoned the largest of all yet known. It is produced from the trunk of the tree, as if the branches, however large and strong, were not able to bear it; its shell is so strong, that there is occasion for an ax or hatchet to open it; and within are innumerable cells or vesicles containing a pulp of a yellow colour, which surrounds a kernel like the chestnut, that is exceeding sweet when ripe.

JACAMACIRI, in *Ornithology*, the name of a very remarkable Brazilian bird, approaching to the nature of the woodpecker, and having feet of the same sort with the birds of that genus, the toes standing two before and two behind; it is of the size of a lark; its feet are yellow; its head, back, and wings, are all of a very lively green, variegated with yellow and red, and its breast and belly of a dusky yellow; it is a very splendid and beautiful bird, its colours glowing very brightly in the sun. Margrave.

JACANA, in *Ornithology*, the name of a Brazilian bird, a species of moor hen. It is a very elegant and beautiful kind; it is of the size of a pigeon, but its legs are much longer, and are of a greenish yellow, and all its toes, especially the hinder one, are of a very remarkable length; its tail is short, its colour on the back, belly, and wings, is a mixt green and black; its neck and breast are of the changeable colours they are in the peacock, and in some pigeons; its head is small, and is covered with a membrane of the colour of the oriental turquoise stone; the beak is shaped like that of the gallinaceous kind, and is about a finger's breadth long, and is partly of a greenish yellow, partly of a very elegant red: it is very common in watery places in Brazil, and is eaten, but not esteemed a fine fowl. Margrave.

JACAPU, in *Ornithology*, the name of a bird of the merula or blackbird-kind, and of the size and shape of the common blackbird; its upper part is all of a deep black, except that the tips of the feathers on the rump are slightly greyish; its breast is of a very fine red, and its tail long and like that of the common blackbird; as are also its beak and feet. Ray.

JACARE, in *Zoology*, the name of an animal found in the Brazil, and very little differing from the crocodile of the other parts of the world, if at all specifically, which Mr. Ray doubts. It has no tongue, but only a sort of membrane, which resembles the shape of one, and which it cannot lift up or move; its eyes are large, round, clear, and very bright, the iris blue, and the pupil of a fine black; the fore-legs are very slender and weak; the hinder ones longer, and more robust; the fore-feet have each five toes; three in the middle, which are long, and armed with very sharp claws; and two at the sides, which have none; the hinder feet have only four toes each;

one of which only on each foot wants a claw, and is the outer one; the farther half of the tail has a strong erect fin upon it, which is of great use to the creature when in the water, serving as the fins of fishes to assist it in swimming. Ray.

JACARINI, in Ornithology, the name of a Brazilian bird of the goldenfinch kind, and of the size of our common goldfinch. Its beak is thick and grey, as are also its legs and feet; it is all over of a fine shining black, like polished steel; its wings are white underneath. Magnave.

JACCHAGOGGI, *Jacchagoggi*, in *Antiquity*, those who carried the banner of the hero *Jason* in procession, at the celebration of the Athenian festival called *ELEUSINIA*. They had their heads crowned with myrtle.

JACEA, in Botany. See *CENTAURY*.

JACINTH, in Botany. See *HYACINTH*.

JACK, in Falconry, signifies the male of birds of sport.

See *FALCON* and *HAWK*.

JACK, in Ichthyology. See *PIKE*.

JACK, in Mechanics, is an instrument in common use for raising heavy timber, or very great weights of any kind.

See *Fig. IV. Mechanic*, fig. 45.

But as the wheel-work of this engine is inclosed in the strong piece of timber CB, the inside of it is represented in fig. 46. where the rack AB must be supposed at least four times as long in proportion to the wheel Q, as the figure represents it; and the teeth, which will be then four times more in number, to be contained about three in an inch. Then if the handle HP be seven inches long, five turns of it, i. e. 5 times 32 inches, or 160 inches, will be the velocity of the power, whilst the weight raised by the claw A, or depressed by the claw B, moves one inch: for as the pinion of the handle has but four leaves, and the wheel Q twenty teeth, there must be five revolutions of the handle to turn the wheel once round, which three-leaved pinion R will, in that revolution, put over the rack three teeth, or one inch. This might have been also known without fering, or even knowing the number of the teeth of the wheel and pinions, by measuring a revolution of the handle in fig. 45, and comparing the space gone through by it with the space gone through by the end A or B. This machine is sometimes open behind from the bottom almost up to the wheel Q, to let the lower claw, which in that case is turned up as at B, draw up any weight. When the weight is drawn, or pushed sufficiently high, it is kept from going back by hanging the end of the hook S, fixed to a staple, over the curved part of the handle at A.

JACK is also the name of a well known engine used for turning a spit: the weight is the power applied; the friction of the pulley, and the weight with which the spit is charged, are the force to be overcome; and a steady uniform motion, is maintained by means of the fly. See the construction of this engine more particularly explained and illustrated by a figure, under the article *MECHANICAL power*.

JACK, *jack*, is an engine used for the same purpose with the common *jack*, and is so called from its being moved by means of the smoke or rarified air, ascending the chimney, and striking against the tail of the horizontal wheel AB, (fig. 47.) which, being inclined to the horizon, is moved about the axis of the wheel, together with the rollers *ferew* C, which turns the wheels D and E; and E carries the chain F, which turns the spit. The wheel AB should be placed in the narrow part of the chimney, where the motion of the smoke is swiftest, and then the greatest part of it must strike upon the tails. The force of this machine depends on the draught of the chimney, and the violence of the fire.

JACK, in a Ship, is a sort of flag or colours, displayed from a mast erected on the outer end of a ship's bowsprit. In the British navy the *jack* is nothing more than a small union flag, composed of the intersection of the red and white crosses; but in merchant-ships this union is bordered with a red field. See *Tab. of Flags and Ships*, fig. 1. N° 146.

JACK is a tree, *Hernandia*, in Botany, a genus of the *muscaria* triandria class. Its characters are these; it has male and female flowers on the same plant; the male flowers have a partial involucrum, composed of four oval small leaves, which inclose three flowers, each of which has a proper bell-shaped calyx of one leaf; the petal is funnel-shaped, cut into six parts at the brim; and it has three short stamina inserted in the calyx; the female flowers are shaped like the male, but want stamina, and have a roundish germen; the calyx becomes a large swollen, oblong fruit, perforated at each end, inclosing one hard globose nut. There is one species, according to Miller, but Linnaeus reckons two, growing naturally in the West Indies. As the fruit of this plant is perforated, and the nut within becomes hard; so when the wind blows through

the fruit, it makes a whistling noise, to be heard at some distance. It is propagated among us in the gardens of the curious, by only sowing the seed in a hot-bed in the spring. They must be constantly kept in the back stove.

JACK, in the hedge, in Botany. See *HEDGE MUSTARD*, and *Dandelion*.

JACK-daw, in Ornithology, a species of the *corvus* or crow; being the *corvus monedula* of Linnaeus. The head of this bird is large in proportion to its body; the irides are white; the forehead is black; the hind-part of the head and a fine light grey; the rest of the plumage is black, finely glossed with blue; the feet and bill black; the claws very strong and hooked. This is a docile and inquisitive bird. *Jack-daws* breed in crevices, old castles, and high rocks, laying five or six eggs: they feed on insects, grain, and seeds. Pennant.

This bird is very mischievous to the farmer and gardener, and is of such a devilish disposition, that he will carry away much more than he can make any use of. There is a method of destroying this bird by a particular sort of spring, which is much practised in some parts of England, and is so useful, that it ought to be made universal. The method is this; a stake of about five feet long is to be driven firmly into the ground, and made so fast that it cannot move, and so sharp pointed at the top, that the *jack-daw* cannot rest upon it. Within a foot of the top there must be a hole bored through it, of three quarters of an inch in diameter; through this hole is to be put a stick of about eight inches long, then a horizontal spring or noose is to be fastened to a thin hazel-rod, and is brought up to the place where the short stick is placed, and carried with it through the hole; the remainder being left open under that stick. The other end of the hazel-rod is to be put through a hole in the stake near the ground, and fastened there; the stake is to be planted among the *jack-daws* flock, and he will naturally be led to settle on it; but finding the point too sharp, he will descend to the little cross stick; this will sink with its weight, and the spring will receive his leg, and hold him fast.

JACK-arch, in Architecture, is an arch one brick thick.

JACK-head, in Hydraulics, a part sometimes annexed to the *force-pump*.

JACK-knob is a name given by the populace to the common hangman.

JACK-is-a-lower, See *IGNIS fatuus*.

JACK-saule, in Ornithology, the *Jacksaule* of the French, is about half the size of the common *curlew*; and is therefore, sometimes called the *half-curlew*. The colour of the head is black, tinged with rust; the eyes are small; the eye is a yellow fawn; the neck is variegated with blue, brown, and pale red; the scapular feathers are narrow, very long, and brown, bordered with yellow; the rump is of a glossy bluish purple; the belly and vent white; the tail brown, edged with tawny, and consisting of twelve pointed feathers; the legs are of a cinereous green. The haunts and food of this species are the same with those of the common *saule*; but it is much less frequent, and will not rise till it is almost trod upon. Its motion is sluggish, and flight never distant. Pennant.

JACK-windmill, in our *Old Writers*, a kind of defensive coat-armour, worn by herlemen in war, not made of solid iron, but of many plates fastened together, which some persons by tenure were bound to find upon requisition.

JACK is used also for a horse or wooden frame to the timber upon; for an instrument to pull off a pair of shoes; for a great leathern pitcher to carry drink in; for a small bowl that serves as a mark at the exercise of *balling*; and for a young pike.

JACKALL, in Zoology, the name of a creature of the dog-kind, the *canis aureus* of Linnaeus, called by authors *lypsa aurea*, the *gold-coloured wolf*, and by the modern Greeks *spalio*. It is smaller than the *wolf*, and of a very beautiful yellow colour. These animals are always seen in large flocks together, not unfrequently to the number of two hundred in a flock; and meet like hounds in full cry from evening till morning. It is a very voracious animal, and will steal peoples things away while they sleep, not sparing such as can be of no use to it, as their hats, shoes, or the like. There is scarce an animal which the *jackall* will leave unmolested: in want of living prey, it will feed on roots, fruits, and carrion; greedily devour the dead, and feed on the putrid corpses. Their howls in the pursuit of caravans and armies are dreadful. It is a very common creature in Cilicia, and is heard barking all night long. They may be sometimes robbed of their prey by the lion; but the vulgar notion of their attendance on that animal is fabulous. The *jackall* is vulgarly called the lion's provider, from

an opinion, that it rouses the prey for it; but this is merely an accidental benefit, which the lion derives from its terrifying cries, by which it rouses almost every creature in the forest. Shaw's Travels, p. 247.

JACOBÆA, in Botany. See **RAGWORT**, and **GROUNDSILL**.

JACOBÆOIDES, in Botany. See **GOLDEN ROD**.

JACOB'S ladder, in Botany. See **GRIST VALERIAN**.

JACON'S staff, a mathematical instrument for taking heights and distances; the same with the **CROSS-STAFF**.

JACOBINE, the name of a particular species of pigeon, called by Montu the *columba cyria cucullata*. It is generally called the *jack*, for thornneck. It is, when genuine and of the true breed, the smallest of all pigeons. It has a range of feathers inverted quite over the hinder part of its head, and reaching down on each side of the neck to the shoulders of the wings, which forms a kind of friar's hood, from whence the bird has its name. This species has also a short bill, and a peary eye. The colour is various in the feathers; there are reds, yellows, blues, blacks, and mottles; but whatever is the general colour, the head, tail, and feet, are white. Some pigeons of this species are feather-legged, others are not.

JACOBINS, a name given in France to the religious who follow the rule of St. Dominic, on account of their principal convent, which is near the gate of St. James, in Latin *Jacobus*, at Paris; and which, before they came possessed of it, in the year 1218, was an hospital of pilgrims, dedicated to the said saint. See **DOMINICANS**. Others maintain, that they have been called *Jacobins* ever since they were established in Italy, because they pretended to imitate the lives of the apostles.

They are also called *friars preachers*, or *preaching friars*.

JACONITES, a sect of heretics, who were anciently a branch of the Eutychians, and are still subsisting in the Levant.

They were so called from Jacobus, James, of Syria, called Baraduan, who was one of the heads of the Monophysites, or sectaries who owned but one nature in Jesus Christ.

This poor monk revived the cause of the Monophysites by his activity and diligence; and when he died bishop of Edessa, A. D. 588, he left his sect in a most flourishing state in Syria, Mesopotamia, Armenia, Egypt, Nubia, Abyssinia, and other countries.

The Monophysites were a sect of vast extent, comprehending the Armenians, Copts, and Abyssinians; but those among them who are properly *Jaconites*, were but few; and among those, too, there is now a division, some being Romanized, and others perfectly averse to the Romish church; each of which parties have their several patriarchs.

As to their faith, all the Monophysites, both Jacobites and others, follow the doctrine of Dioscorus touching the unity of nature and person in Jesus Christ.

JACOBITES, in England, is a term of reproach bestowed on such persons as disallow of the revolution by king William, and still assert the rights, and adhere to the interests of the abdicated king James, and his line.

JACOBUS, a gold coin, worth twenty-five shillings; so called from king James the First of England, in whose reign it was struck. We usually distinguish two kinds of *Jacobus*, the old and the new; the former valued at twenty-five shillings, weighing 68 penny-weights ten grains; the latter, called also *Carolus*, valued at twenty-three shillings; in weight five penny-weights twenty grains.

JACITATION of marriage. See **MARRIAGE**.

JACQUINIA, in Botany, a genus of the *pentandria monogamia* class; the characters of which are, that the corolla is divided into ten segments; the stamens are inserted in the receptacle; and the fruit is a single-seeded berry.

JACULATOR, or *flamingo-fish*, in Ichthyology, is a species of the *acanthias* in the Linnæan system, or the *cartilaginei* system, with an entire tail, nine spines in the dorsal fin, and a brown circular spot, resembling an eye, and cylindrical finca. This fish is found in India, and derives its name from the manner in which it collects its food. For this purpose it frequents the shores and sides of the sea and rivers; and when it spies a fly on the plants, that grow in shallow water, it swims on to the distance of four, five, or six feet, and then, with a surprising dexterity, ejects out of its tubular mouth a single drop of water, which never fails to strike the fly into the sea or river, where it soon becomes a prey. Phil. Trans. vol. lvi. p. 14. and vol. lvi. art. 21. See Tab. II. of Fish, p. 15.

JACULUM, in Zoology, the name of a species of serpent found in Rhodæ, and some other places, and more usually called *ACONITAS*.

JACUPEMA, in Ornithology, the name of a Brazilian bird

of the pheasant-kind, nearly as large as the common European hen. Its feet are of a fine red; it is a very well tailed fowl, and is easily kept tame. It has its name from the noise it makes, which is *jacu, jacu, jacu*. Margrave.

JACUT, in the *Natural History of the Arabians*, is generally supposed to be the name of the ruby only; and it is owing to this, that among the gems used by the Arabian physicians in medicine, the ruby is supposed to have been most of all in esteem, as the name *jacut* often occurs in their writings than that of any other of the gems.

JACUT-AGA, is the name of an officer in the court of the grand seignior. He is one of two eunuchs who have the care of the treasure.

JADDESSES is the name of an inferior order of priests in Ceylon, who have the care of the chapel appropriated to the geni, who form a third order of gods among these idolaters. These priests are applied to by the people in a time of distaste or calamity, who offer a cock on their behalf to appease the anger of the demons.

JADE, a greenish stone, bordering on olive-colour, much esteemed for its hardness, which exceeds that of porphyry, agate, or jasper; and is only to be cut with diamond-lap.

It is in great esteem among the Turks and Poles, who adorn all their fine works with it, and especially the handles of their sabres.

This stone, applied to the reins, is said to be a preservative from the nephritic colic. M. Bernier tells us, that the caravans of Tibet carry it to Cachemire, and that the Galibis prize it as highly as the diamond. The natives of South America value it on account of the virtues they attribute to it in the epilepsy, stone, and gravel. In a treatise on it, printed at Paris, it is called the *divine stone*. See **LAVIS ZIRCON**, and **NEPHRATIC STONE**.

JAGRA, a name given to a peculiar species of sugar, prepared from the coco-nut.

JAGUACALL, *guana*, in Ornithology, the name of a Brazilian bird of the kingfisher-kind, called by the Portuguese *jagu peixe*. It is of the size of a thrush, and in shape much resembles the European kingfisher. Margrave.

JAGUARA, in *Natural History*, the name of a Brazilian animal, accounted by Margrave a species of tiger, but differing from that creature, and approaching to the leopard in the shape of its variegations, which are so many round spots; it is all over of a yellowish colour, beautifully variegated with black spots differently disposed; it is a very fierce animal, and as ravenous of human flesh as that of beasts. Ray. See Tab. III. *Quadrupeds*, N° 25.

JAGUARACA, in Ichthyology, the name of a Brazilian fish in many things resembling the *Scorpaena* of the Mediterranean. It is of the size of the fresh-water perch, and its mouth is very large, but without teeth. It is caught among the rocks, and is a very well tailed fish. Margrave.

JAGUARETE, in *Natural History*, the name of a Brazilian beast of prey, accounted by Margrave a species of tiger, but improperly, its roundish spots arguing it of the lynx or leopard kind. It is of the size of a young beaver, of a yellowish colour, variegated with black and brown spots, and is a very fierce and destructive animal. It much resembles the creature called jaguara but is larger; and the spots which in that are all round, are in this some round, and some of other figures. The Portuguese call both by the same name, *agui*.

JAIL. See **GALILE**.

JAIL fever. See **FEVER**, and **HOSPITAL fever**.

JALAP, in Medicine, so called from the name of the country, viz. Chalapa, or Xalapa, a province in New Spain, between La Vera Cruz and Mexico, whence it is brought, the root of a species of the *CONVOLVULUS*, or the *esculeus* with variable leaves, foot-stalks with single flowers, and a tuberosa root.

The mechoacan is also reckoned a species; and therefore as this is sometimes called *mexicana nigra*, that goes as often by the name of *jalapum album*.

As jalap does not appear to have been known to the ancients, it has its place in medicine only since those parts of America, which produce it, have been traded to by the Europeans.

The jalap roots are brought over in thin transverse slices, solid, hard, and heavy; of a blackish colour on the outside or cortical part, and internally of a dark greyish, with several black circular streaks (the hardest, darkest coloured, and those which have most of their resinous veins, are the best). This root has scarcely any smell or taste. In doses of a scruple, or half a dram, it is an effectual and safe purgative, very rarely occasioning any severe gripes or nausea. Jalap is an excellent purgative in dropsical and other cases, in which ferrous humours

are to be evacuated. But it should not be administered in acute fevers, nor to persons of dry and hot constitutions; for in such cases, it is liable to the same mischiefs as other acid purgatives, and will sometimes bring on heat and inflammation in the viscera.

The preparations of *jalap* in use with us are a tincture, an extract, and a resin. The tincture is made by digesting three or four ounces of *jalap* in a pint of proof spirit. The extract is prepared by first drawing a tincture from the powdered root with rectified spirit, then boiling the residuum in fresh quantities of water, evaporating the decoctions till they begin to grow thick, mixing in by degrees the tincture inspissated to a like thickness, and continuing a gentle heat till the whole is reduced to a due consistence. This extract may be taken by itself in doses of twelve grains, or more. *Jalap* root, digested in as much rectified spirit as will cover it to the height of about four fingers, gives out the greatest part of the resinous matter in which its activity resides, and tinges the menstruum of a yellowish brown colour. On inspissating the filtered tincture to about one half, and adding to the remainder a proper quantity of water, the liquor becomes milky, and on standing deposits the pure resin. This preparation, by itself, irritates and gripes much, without proving considerably purgative; but thoroughly triturated with terebinth or other powders, or with lozengs or ground with almonds, or powdered gum arabic, and made into an emulsion with water, or dissolved in rectified spirit, and mixed with a proper quantity of syrup, that the solution may bear being diluted with watery liquors without precipitation, it purges, in doses of eight or ten grains, as effectually, and, for the most part, as mildly as the *jalap* in substance. Lewis's Mat. Med.

After all the preparations the chemists have invented for this root, the best way of giving it is in substance. Mr. Boldue, in his analysis of it, found, that when he separated its saline and its resinous parts, by making extracts of it first with spirits of wine, and then with water, that the saline or watery extract was much larger in quantity than the other, but that it perged weakly; and that the resinous extract, though it operated in a small dose, was yet a very rough medicine; so that the best way of using them was together, and that nature gave us the medicine ready prepared. Mem. Acad. Par. 1701.

However, others have observed, that the extracts of *jalap* appear preferable to the root in substance, not only on account of the dose being rendered smaller by the rejection of the woody parts, but likewise as being more uniform and certain in strength. Lewis.

Many fraudulent chemists, when *jalap* is dear, have a trick of putting scammony, which is of itself almost all resin, among it, and sometimes gamboge; by which means they can afford to sell it cheaper than the price it can be honestly made for. But their most curious cheat is in mixing it with common black resin; two parts of the latter to one of the former. But this may be known by putting it into rectified spirit, which will again dissolve the resin of *jalap*, but not touch the other. The virtues are the same with those of the root, but it works rougher, because all substances thick to the coats of the intestines, so as to occasion much pain and uneasiness; for which reason this is corrected with sugar, cream of tartar, or the like; by which means it is brought into the same state as nature presents it in the root. For some purposes, indeed, where the form is required to be small, as often in administration to children, this is most convenient. Its dose is from three grains to one scruple.

Jalap possesses a fermenting power in a considerable degree, and is said to be used with this intention by brewers and distillers.

JALAPA, in Botany. See MIRABILIS.

JALEMUS, Jalumus, in Antiquity, a kind of mournful song, used upon occasion of death, or any other affecting accident. Hence the Greek proverb had their original, *καλὸν καλῆς, or ὀχρεῖας, i. e. more sad or sadder than a jalemus, or τοῦ καλῆς ὑπὸ πένθος, worthy to be ranked among jalemus.* Mem. Acad. Inscript. tom. xiii. p. 554.

JAL, or JAM, in the language of our lead-miners in Mendip, a thick bed of stone, which hinders their work when they are pursuing the veins of ore.

JAMACAI, in Ornithology, the name of a Brazilian bird, of the size of a hawk; its head is small, its beak a little bent downward; its head is black, its throat also black, but the upper part of its neck yellow; its back, breast, and belly, are also yellow; its wings are black, but have each one white spot; its tail also is black, and its legs and feet brown; it is an extremely beautiful bird, and has a long tail, that it seems to belong to the wagtail, or monedula kind. Narprave.

JAMAICA pepper. See PIMENTO.

JAMAICA wood. See BRAZIL.

JAMBEAUX, among our Old Writers, armour for the legs.

The word is French, from *jambe*, the leg.

JAMNIC, in ancient Poetry, a kind of verse, found in the Greek and Latin poets; consisting wholly, or at least in great part, of iambics, or feet so called.

Iambic verses may be considered, either with regard to the diversity, or the number of their feet: under each of which heads there are distinct kinds, which have different names. 1. *Pure iambics* are those which consist entirely of iambics; as the fourth piece of Catullus made in praise of a ship:

Phoebus ille, quem videtis hospitale.

The second kind are those called simply *iambics*. These have no iambics but in the even feet, though there are sometimes tribachys added to them, excepting to the last, which is always an iambus; and in the uneven feet they have spondee, anapaest, and even a dactyl, in the first: such is that of Meles in Ovid.

Servare potui: perdere an possum rogas?

The third kind are the free *iambic* verses, in which it is not absolutely necessary there should be any iambus, excepting the last foot; of which kind are all those of Phaedrus:

Amicitia maris propinquum, qui animam opusculi.

In comedies, the ancient authors seldom confine themselves more, frequently less, as we may observe, in Plautus and Terence; but the sixth is always indispensibly an iambus.

As to the varieties, occasioned by the number of syllables, *iambic* is that which has six or four feet:

Reperitur in fides vici.

Those which have six are called *trimeters*: these are the most beautiful, and are used principally for the theatre, particularly in tragedy; wherein they are vastly preferable to the verses of ten or twelve feet, used in our modern drama; because they come nearer to the nature of prose, and favour less of art and affectation:

Dixi caryophagus, tuque genialis tori

Lacina cultus, &c.

Those with eight are called *tetrameters*, and are used in comedies:

Pavonium in Luce nigrifera maximum interdam ossi lacrum.

Terent.

Some add an *iambic* monometer, with two feet:

Virtus heu.

They are called *monometers, dimeters, trimeters, and tetrameters*; that is, of one, two, three, and four measures, because a measure consisted of two feet: the Greeks measuring their verses two feet by two feet, as by *anapaests*, or *epitrites*, joining the iambus and spondee together.

All the *iambics* hitherto mentioned are *perfect*; they have their just number of feet, without any thing either deficient or redundant. The *imperfect iambics* are of three kinds; the *catalectic*, which want a syllable:

Mela ferunt umbones.

The *brachycatalectic*, which want an entire foot:

Mela ferunt gnatas.

The *hypercatalectic*, which have either a foot or a syllable too much:

Mela ferunt sunt Minerva.

Mela ferunt Palladis ignem.

Many of the hymns and anthems used in the Romish church, are *dimeter iambic*, that is, consisting of two feet.

JAMBLIC sal, in Medicine, a kind of salt preparation, with sal ammoniac, and several aromatic ingredients, such as pepper, ginger, thyme, origanum, and the like; so called from its reputed author Jamblachus, and composed by many old writers to be an excellent medicine for concocting the crude humours, and gently purging the stools. It was taken fasting in the quantity of half a spoonful, either alone or in a poached egg, or mixed with any liquor.

JAMBOLIFERA, in Botany, a genus of the *extensa* or *hypogynia* class; the characters of which are, that the calyx is quadrilateral, and the corolla has four points, and is funnel-shaped.

JAMBON, in Natural History, a name given by authors to a kind of sea-shell, resembling a ham of bacon. It is a species of *PRINNA marina*.

JAMBS, among Carpenters and Bricklayers. See JAUMS.

JAMBU, in Ornithology, the name of a Brazilian species of partridge, of which there are two species. They are of a dusky yellow colour, and are equal to the European partridges in the delicacy of their taste. Narprave.

JAMBUS, in Poets, in the Greek and Latin Poets, a poetical foot, consisting of a short syllable followed by a long one; as in

ὄρε, ἄρρε, δι, μεν.

Syllaba

Syllaba longa brevis subiecta vocatur iambus, as Horace expresses it; who also calls the *iambus* a swift, rapid foot, *po. citus*.

The word, according to some, took its rise from Iambus, the son of Pan and Echo, who invented this foot; or, perhaps, who only used sharp biting expressions to Ceres, when afflicted for the death of Proserpine. Some rather derive it from the Greek *ἰαμῶν, παῖς*, or from *ἰαμῶν, μάστιξ*, *i. e.* a staff, or rod, because the verses composed of *iambics* were at first only used in satire. The invention of this kind of verse is ascribed by Horace to Archilochus.

Archilochus propinquit armatus iambos.

Ari. Poet.

JAMES, St. JAMES of the Sword, *San Jaco del Espado*, a military order in Spain, instituted in 1470, under the reign of Ferdinand II. king of Leon and Galicia. Its end was, to put a stop to the incursions of the Moors; three knights obliging themselves by a vow to secure the road.

An union was proposed and agreed to in 1370 between these and the canon of St. Eloy; and the order was confirmed by the pope in 1372.

The highest dignity in that order is that of grand-master, which has been wanted to the crown of Spain. The knights are obliged to make proof of their descent from families that have been noble for four generations on both sides; they must also make it appear, that their said ancestors have neither been Jews, Saracens, nor heretics, nor even to have been called in question by the inquisition.

The novices are obliged to serve six months in the galleys, and to live a month in a monastery. Heretofore they were truly religious, and took a vow of celibacy; but Alexander III. gave them a permission to marry. They now make no vows but of poverty, obedience, and conjugal fidelity; to which, since the year 1652, they have added that of defending the immaculate conception of the holy Virgin. Their habit is a white cloak, with a red cross on the breast. This is esteemed the most considerable of all the military orders in Spain: the king especially preserves the office of grand-master in his own family; on account of the rich revenues and offices, whereto it gives him the disposal. The number of knights is much greater now than formerly, all the grandees choosing rather to be received into this, than into the order of the Golden Fleece; inasmuch as this puts them in a fair way of attaining to commands, and gives them no considerable privileges in all the provinces of Spain, but especially in Catalonia.

There was an order of the same name and kind instituted in Portugal by king Don Denis VI. in 1310.

St. James's Day, a festival in the calendar, observed on the twenty-fifth of July, in honour of St. James.

Epistle of St. JAMES, is a canonical book of the New Testament, being the first of the catholic epistles. See **EPISTLE**.

JAMMING, in general, denotes the act of enclosing any object between two bodies, so as to render it immovable.

In *Sea-Language*, this expression is applied to the situation of some running rope, when it happens to be squeezed by the compression of the standing-rigging, &c. and consequently incapable of performing its office, by travelling in the blocks, till it is released. In this sense *jamming* is opposed to **RENDERING**.

JAMPNUM, in *Old Writers*, furze, or coarse, and gorse ground. This word is used in lines of lands, &c. and seems to come from the French *jaune*, *i. e.* yellow; because the blossoms of **FURZE** or **GORSE** are of that colour. 1 *Coke* 179.

JANA, among the *Romans*, a name given to **DIANA**, or the moon.

JANITORES, door-keepers, among the *Romans*, the meanest of their slaves, who were commonly chained to their posts.

JANIZARIES, an order of infantry in the Turkish armies; reputed the grand seignior's foot-guards.

Vossius derives the word from *genitars*, which, in the Turkish language, signifies *new recruits*, or *recruits*. D'Herbelot tells us, that *janizari* signifies a new sword, or *troop*; and that the name was originally given by Amurath I. called the Conqueror, who choosing out one-fifth part of the Christian prisoners, whom he had taken from the Greeks, and instructing them in the discipline of war, and the doctrines of their religion, sent them to Haji Bekrafche (a person whose pretended piety rendered him extremely revered among the Turks), to the end that he might confer his blessing on them, and at the same time give them some mark to distinguish them from the rest of the troops. Bekrafche, after blessing them in his manner, cut off one of the sleeves of the tur gown

Vol. II. N° 180.

which he had on, and put it on the head of the leader of this new militia; from which time, viz. the year of Christ 1361, they have still retained the name *janizari*, and the tur cap. Others ascribe their origin to Sultan Amurath II. in the year 1372.

The *janizaries* are children of tribute, lected by the Turks among the Christians, and bred up to the military life. They are taken at the age of twelve years, to the end, that forgetting their country and religion, they may know no other parent but the sultan. However, generally speaking, they are not now a-days raised by way of tribute; for the church, or tax, which the Turks impose on the Christians, for allowing them the liberty of their religion, is now paid in money; excepting in some places, where money being scarce, the people are unable to pay in specie, as in Mingrelia, and other provinces near the Black Sea.

As in the Turkish army, the European troops are distinguished from those of Asia, the *janizaries* are also distinguished from the *janissaries* of Constantinople, and of Damascus.

Their pay is from two aspers to twelve per diem; for when they have a child, or do any signal piece of service, their pay is augmented.

Their dress consists of a dolymen, or long gown, with short sleeves, which is given them annually by the grand seignior, on the first day of Ramadan. They wear no turban, but in lieu of that a kind of cap, which they call *zerzale*, and a long hood of the same stuff hanging on their shoulders. On solemn days they are adorned with feathers, which are stuck in a little case in the fore-part of the bonnet.

Their arms in Europe, in a time of war, are a sabre, a carbine, or musket, and a cartouch-box hanging on the left side. At Constantinople, in time of peace, they only carry a long staff in their hand. In Asia, where powder and fire-arms are more uncommon, they wear a bow and arrows, with a poignard, which they call *hanjars*.

The officer who commands the whole body of *janizaries* is called the *janissar agasi*; in English, *aga* of the *janizaries*. He is one of the chief officers of the empire.

Though the *janizaries* are not prohibited marriage, yet they rarely marry, nor then, but with the content of their officers; as imagining a married man to make a worse soldier than a bachelor.

The *janizaries* were at first called *jese*, that is, footmen, to distinguish them from the other Turks, the troops whereto consisted mostly of cavalry.

Vigorelli tells us, that the discipline observed among the *janizaries*, is extremely conformable, in a great many things, to that used in the Roman legions.

The *janizaries* were heretofore a body for formidable even to their masters, the grand seigniors. They slewed Bajazet II. in 1512, they procured the death of Amurath III. in 1595. Osman II. they first stripped of his empire, and afterwards of his life, in 1674; and in about two months dethroned Mustapha, whom they had made his successor; and in 1699 they deposed Sultan Ibrahim, and at last strangled him in the castle of the Seven Towers; and in 1730 they obtained the sacrifice of the grand vizir, the *reis effendi*, and the captain bashaw, and deposed and imprisoned Achmet III. and advanced the sultan Mahomet, son of Mustapha II. from prison to the throne, in his stead. The number of real *janizaries* is only twenty-five thousand; but the privileges belonging to their order, such as exemption from taxes, and the performance of public duties, have induced many persons to bribe the officers, in order to their being admitted into the number of *janizaries* without pay.

JANIZARIES, at Rome, are officers or pensioners of the pope, called also *participantes*, on account of certain rites or duties which they enjoy in the annates, bulls, or expeditions, and the Roman chancery.

Most authors are mistaken in the nature of their office: the truth is, they are officers of the third bench, or college of the Roman chancery. The first bench consists of writers, the second of abbreviators, and the third of *janizaries*; who are a kind of correctors and revisors of the pope's bulls.

JANNANINS, in *Modern History*, the name which the Negroes, in some of the interior parts of Africa, give to spirits which they apprehend to be the phantasms or souls of their ancestors, and which they go to the tombs to consult and worship. Every Negro has his tutelary *jannanin*, and so has likewise every village, to whom private and public worship is respectively addressed. The women, children, and slaves, are forbid to attend their public worship.

JANNOCK, a kind of oaten bread, much used in the northern parts of England and made of four leaved.

JANSENISM, in *Ecclesiastical History*, the doctrine of Cornelius Jansen, commonly called *Jansenism*, bishop of

Ypres, in Flanders, chiefly with relation to grace and free-will.

Janseius was born of catholic parents in Holland, and studied at Utrecht, Louvain, and Paris.

Janseius made no great noise in the world, till after the death of his author, in 1658, when Promond and Calenus, his executors, published his book, entitled *Augustinus*. This book had been the labour of twenty years, was just finished before the author's death, and published at Louvain in 1640. Janseius was led to engage in this work by the controversy that was carried on, in the beginning of the seventeenth century, between the Jesuits and Dominicans, concerning the nature and necessity of divine grace; the decision of which had, towards the conclusion of the preceding century, been committed by Clement VIII. to a select assembly of learned divines. These arbiters, after much examination, delivered their opinion to the pontiff, that the sentiments of the Dominicans, concerning grace, predestination, human liberty, and original sin, were more conformable to the doctrine of scripture, and the decisions of the ancient fathers, than the opinions of Molina, which were patronized by the Jesuits. The former, they observed, inclined to the tenets of Augustine, and the latter bore a striking resemblance to the Pelagian heresy. In consequence of this declaration, Clement seemed resolved to condemn the Jesuits, and to determine the controversy in favour of the Dominicans. In 1603 the Jesuits prevailed on the old pontiff, by intercessions, menaces, arguments, and complicity, to re-examine this intricate controversy, and to undertake the office of principal arbitrator. For this purpose he chose a council, called the congregation of auxiliaries, or the congregation of auxiliaries, composed of fifteen cardinals, nine professors of divinity, and five bishops, which, in the space of three years, assembled seventy-eight times. The death of Clement, in 1605, prevented his pronouncing a decisive sentence with regard to this controversy; nor are his sentiments certainly known, though the Jesuits and Dominicans contend, that his decision would have been favourable to their respective party. The proceedings of this congregation were resumed, in 1605, by order of Paul V. the successor of Clement. The result of many long deliberations was, that the whole controversy, instead of being decided, should be suppressed; and that each of the contending parties should have the liberty of following their respective opinions. Paul V. declined a public determination of the controversy, through apprehension of offending either the king of France, who protected the Jesuits, or the king of Spain, who warmly maintained the cause of the Dominicans. The same of controversy broke out again with new violence in the year 1640, on the publication of Janseius's book, which was divided into three parts: the first being historical, and containing a relation of the Pelagian controversy, which arose in the fifth century; in the second the author gives an accurate account and illustration of the doctrine of Augustine, relating to the constitution and powers of the human nature, in its original, fallen, and renewed state; and the third part contains his doctrine, relating to the aids of sanctifying grace procured by Christ, and to the eternal predestination of men and angels. The design of Janseius in this work was, to show in what manner the important points in debate had been understood and explained by Augustine, whose name and authority were universally revered in all parts of the Roman catholic world. The Dominicans, who followed the sentiments of Thomas Aquinas, concerning the nature and efficacy of divine grace, derived very considerable advantage from this publication; whilst the Jesuits considered it as not only a tacit but formidable refutation of their opinions concerning human liberty and divine grace. They therefore exerted their most zealous endeavours to obtain a public condemnation of it from Rome; and they succeeded, in far as to procure a prohibition of the perusal of it, by the Roman inquisitors, in the year 1641; and in 1642 a solemn bull of Urban VIII. condemning it, as fraught with several errors, that had been long banished from the church. However, the decisions of the inquisition, and the bull of the pontiff, were disregarded in many parts of the Roman church. The doctors of Louvain, the followers of Augustine in the Netherlands, and the abbot of St. Cyran, and other famous and learned men, known under the denomination of the Authors of Port-royal, in France, opposed the proceedings of the Jesuits, and strenuously supported the cause of *Janseius*: though the greater part of the French theologians engaged in behalf of the Jesuits. The dispute was now become very general and violent; and both parties exerted all their learning, art, interest, and power, to vindicate their respective cause. The *Janseists* resorted to miracles in confirmation of their doctrine; and the history of the controversy furnishes many legendary tales of miraculous cures wrought

in its favour; the first of these miracles occurs in 1635, when a pretended thorn of that desolate crown that was put upon our Saviour's head by the Roman soldiers, is reported to have performed several wonderful cures in the convent of Port-royal: these were succeeded by other prodigies in the years 1661 and 1664. The same pious frauds were revived in 1722, 1727, and 1731, when the bones of the Abbe de Paris, which were interred at St. Medard, are said to have been instrumental in performing innumerable miracles. However, the opposers of the doctrines of St. Augustine selected five propositions out of Janseius's book, which, by the interest and importunities of the Jesuits, were condemned by a public bull of Innocent X. in 1653. These propositions contained the following doctrines:

I. Some commands of God are impeditious to righteous men, even though they endeavour, with all their powers, to accomplish them; the grace being wanting, by which they should be enabled to perform them. II. In the state of corrupted nature, a man never resists inward grace. III. To merit and demerit in the present state of corrupt nature, it is not requisite a man should have that liberty which excludes necessity; that which excludes constraint is sufficient. IV. The Semipelagians admitted the necessity of inward preventing grace to each act in particular, and even to the beginning of faith; but they were heretics, in regard they asserted, that this grace was such as that the will of man might either resist or obey it. V. It is Semipelagianism to say, that Jesus Christ died, or shed his blood, for all men in general.

Of these propositions the pontiff declared the first four only heretical; but he pronounced the fifth rash, impious, and injurious to the Supreme Being. The *Janseists*, availing themselves of a subtle distinction invented by Arnaud, considered separately in this controversy the matter of doctrine, and the matter of fact, i.e. they acknowledged themselves bound to believe that the five propositions above mentioned were justly condemned by the Roman pontiff; but they maintained, that the Pope had not declared, and consequently, that they were not bound to believe, that these propositions were to be found in Janseius's book, in the sense in which they had been condemned. But this artificial distinction was of no long service to them; for Alexander VII. issued out a solemn bull in 1656, declaring, that the five propositions that had been condemned, were the tenets of Janseius, and were contained in his book; and in 1666 he sent into France the form of a declaration, that was to be subscribed by all who fought preferment in the church, affirming, that the five propositions were to be found in the book of Janseius, in the same sense in which they had been condemned by the church. This declaration provoked the most deplorable tumults; the *Janseists* maintaining, that the decisions of the pope, so far as they were not confirmed by a general council, with regard to matters of fact, were fallible; and the Jesuits, on the contrary, that unlimited confidence in the papal decisions, both with respect to matters of fact, and of opinion, was an essential character of a well grounded and divine faith. The Jesuits prevailed, and the *Janseists* suffered exile, imprisonment, and various kinds of prosecution. Clement IX. in consequence of the spirited remonstrance of several bishops, and the earnest application of Anne Genevieve de Bourbon, duchess of Longueville, accepted a conditional subscription to the declaration of his predecessor, allowing the *Janseists* the privilege of interpreting it in their own sense. This indulgence restored tranquillity, and produced a period in this controversy, commonly called the Peace of Clement; but it was soon disturbed again by a public edict of Lewis XIV. and totally abolished after the death of the duchess of Longueville, in the year 1699. The famous Arnaud retreated on this occasion into Holland, where he gained over the Roman congregations to the *Janseist* party; and this party, secured under the protection of the Dutch government, has since prevailed in that country. The *Janseists* were particularly offensive to the Jesuits, on account of the austerity of their party, and the severity that reigned in their system of moral discipline and practical religion; for they have exclaimed against the corruptions of the church of Rome, both with regard to its doctrines and morals; and urged the necessity of instructing the people in the doctrines and precepts of Christianity; with this view they have maintained that the holy scriptures and public liturgy should be perused by the people in their mother tongues, and taught, that true piety does not consist in the observance of pompous rites, or in the performance of external acts of devotion, but in inward holiness and divine love. This apparent piety of the *Janseists* has, however, been unhappily blended with superstition and fanaticism; and they have been branded, not altogether without reason, with the denomination of *Mystics* and *Rigourists*. See QUARTET. The con-

troverly relating to *Jansenism*, which was one of the principal sources of that division which reigned within the papal jurisdiction, has been carried on with great animosity in France and the Netherlands; and the *Jansenists* were for a considerable time much inferior to the Jesuits in numbers, power, and influence, though they equalled their adversaries in resolution, perseverance, and learning, and surpass them in fancy of manners and superstition, by which they excite the respect of the people. The United provinces, particularly the Netherlands, have afforded them an asylum on many occasions: nevertheless the Jesuits, though they have no legal toleration in that republic, have been lately gaining ground among the Dutch papists. They have a flourishing chapel in the city of Utrecht, and places of worship in several other cities, and in a great number of villages. Towards the close of the last, and the commencement of the present century, the cause of the *Jansenists* acquired reputation, by a French translation of the New Testament, made by the learned and pious Paschasius Quenel, a priest of the Oratory; in the annotations to which he has artfully blended the quintessence of *Jansenism*. This work, at the instigation of the Jesuits, and particularly application of Lewis XIV. to the court of Rome, was condemned by Clement XI. who, in 1713, issued the famous bull *Unigenitus*, in which Quenel's New Testament was condemned, and one hundred and one propositions contained in it pronounced heretical. The controversy relating to *Jansenism* was much heated and increased, instead of being mitigated or suspended, by this despotic and ill-judged edict. The *Jansenists* were again obliged to recur to writings, and even to miracles, and visions, and pretended revelations for the support of their declining cause. However, the storm of resentment that has lately arisen against the Jesuits, and that has been attended with the extinction of their order in Portugal, France, and in all the Spanish dominions, has disarmed the most formidable adversaries of *Jansenism*, and must be considered as an event highly favorable to the *Jansenists*. Mollheim's Eccl. Hist. vol. iv. p. 366, &c. vol. v. p. 77, &c. Eng. ed. 1768, Bro.

JANUARY, the name of the first month of the year, according to the computation now used in the West.

The word is derived from the Latin *Januarius*, a name given it by the Romans, from *Janus*, one of their divinities, to whom they attributed two faces; because on the one side the first day of January looked towards the new year, and, on the other, towards the old one.—The word *January* may also be derived from *Janus*, gate; in regard this month being the first, is, as it were, the gate of the year.

January and *February* were introduced into the year by Numa Pompilius; Romulus's year beginning in the month of March.

The Christians heretofore fasted on the first day of *January*, by way of opposition to the superstition of the Heathens, who in honour of Janus, observed this day with feasting, dancing, marriages, &c.

JANUARIUS'S BLOOD. See *Religious acts of blood*. The head of this saint is occasionally carried in procession at Naples, in order to stay the eruption of Vesuvius.

JANUS, Temple of, in *Antient History*, a square building at Rome (as some say) of entire brass, erected by Romulus, and so large as to contain a statue of Janus five feet high, with brazen gates on each side, which were always kept open in time of war, and shut in time of peace. But the Romans were so much engaged in war, that this temple was shut only twice from the foundation of Rome till the reign of Augustus, and six times afterwards. It was first shut during the long reign of Numa, who instituted this ceremony. 2. In the year of the city 519, after the end of the first Punic war. 3. By Augustus after the battle of Actium, in the year of Rome 715. 4. On Augustus's return from the war which he had against the Cantabrians in Spain, A. U. C. 729. 5. Under the same emperor, in the year of Rome 744, about five years before the birth of Christ, when there was a general peace throughout the whole Roman empire, which lasted twelve years. 6. Under Nero, A. U. C. 811. 7. Under Vespasian, A. U. C. 824. 8. Under Constantine, when upon Maximian's death he was left sole possessor of the empire, A. U. C. 1193. Some dispute the authority in which it is said to have been shut by Constantine, and say that the last time of its being shut was under Gordian, about the year of Rome 974. Virgil gives us a noble description of this custom.

Sunt gemina Bulli porta, sic nemus divus, &c.

Æn. lib. vii. ver. 607, &c.

The origin of this custom is not certainly known. See Macrobi. Saturn. lib. l. cap. 9. and Virgil *Æn. lib. vii. v. 601–522*.

JAPACANI, in *Ornithology*, the name of a Brazilian bird of the small sort; its beak is black, long, and pointed,

and a little bent downward; its head is black, and its back, neck, and wings, are of a greenish brown, mixed with black; the tail is black above, and is spotted with white underneath; its breast is of a mixture of white and yellow, as are also its belly and thighs; and these are variegated with innumerable black streaks. *Margrave JAPAN EARL*, see *Cactæto*. * The tree or plant from which the *Japan earl* is extracted is a species of the mixture of Linnaeus, and is very common on the uncultivated mountains of Hindolam, in the province of Balar, westward of Bengal. The substance is extracted from the interior coloured wood, which is cut into chips, and put into a narrow-mouthed unglazed earthen pot; a quantity of water almost sufficient to cover the chips is poured upon them, which is half evaporated by boiling, and then the decoction, without being strained, is poured into a flat earthen pot and boiled to one third part: this is set by in a cool place for one day, and afterwards evaporated by the heat of the sun, stirring it several times in a day: when it is reduced to a considerable thickness, it is spread upon a mortar cloth, which has been previously covered with the ashes of cow-dung, divided into square or quadrangular pieces by a string, and completely dried by turning these frequently in the sun till they are fit for sale. The extract thus prepared is bought of the manufacturer for twelve or fifteen baillings the *Boll* weight. It is much used by the natives in drying and painting cloths and other cloths: combined with the vitriolic salts, a black colour is produced; mixed with oil they paint the beams and walls of houses to preserve them, and to defend them from the destructive white ants; and it is sometimes mixed with their wall plaster. This extract is used only medicinally as a cooling medicine, and when too profusely used it is said to be a destroyer of venereal pleasures. It is also given at the rate of two ounces a day to tame vicious horses. This extract is likewise a principal ingredient in one of their ointments, of great repute, composed of blue viroil, four drams; *Japan earl*, four ounces; alum, nine drams; white resin, four ounces; which are reduced to a fine powder and mixed with the hand, adding of olive oil ten ounces, and water sufficient to bring the mass to the proper consistence of an ointment: this ointment is used in every sore from a fresh wound to a venereal ulcer. Med. Obs. and Inq. vol. v. art. 16.

The London college detects *Japan earl* to be made into troches by beating it with an equal weight of gum arabic, and four times the weight of both, of sugar of roses, and a sufficient quantity of water; but the college of Edinburgh orders one part of the *Japan earl*, four of gum tragacanth, and twenty-four of fine sugar, with rose-water. The *Indiana Japanica* is prepared by digesting three ounces of the *Japan earl* and two of cinnamon in a quart of proof spirit; and this tincture may be given in doses of two or three spoonfuls. For the method of preparing *Japanica confectio*, see *Confection*. *Japan earl* dissolved in water is of a full brown colour, a little inclined to red. It is sometimes used in water-painting, where it has a good effect; but its gummy texture renders its use improper in oil.

JAPANNERS *Gilding*, see *GILDING*.

JAPANNING, the art of varnishing, and drawing figures on wood, &c. after the same manner as the workmen do who are natives of Japan, a famous island not far from the coast of China.
